EXTRACT

From an Act prescribing Rules for the Government of the State Library,
passed March 8th, 1871.

SECTION 11. The Librarian shall cause to be kept a register of all books issued and returned; and all books taken by the members of the Legislature, or its officers, shall be returned at the close of the session. If any person injure or fail to return any book taken from the Library, he shall forfeit and pay to the Librarian, for the benefit of the Library, three times the value thereof; and before the Controller shall issue his warrant in favor of any member or officer of the Legislature, or of this State, for his per diem, allowance, or salary, he shall be satisfied that such member or officer has returned all books taken out of the Library by him, and has settled all accounts for injuring such books or otherwise.

SEC. 15. Books may be taken from the Library by the members of the Legislature and its officers during the session of the same, and at any time by the Governor and the officers of the Executive Department of this State, who are required to keep their offices at the seat of Government, the Justices of the Supreme Court, the Attorney-General, and the Trustees of the Library.

MINING AND SCIENTIFIC PRESS

An Illustrated Journal of Mining, Popular Science and General News

BY DEWEY & CO.,
Patent Solicitors.

SAN FRANCISCO, SATURDAY, JANUARY 5, 1878.

VOLUME XXXVI.
Number 1.

An Improved Car Starter.

Mr. James Pritchard, of this city, has patented through the MINING AND SCIENTIFIC PRESS Patent Agency an improved arrangement of that class of devices for starting horse cars from a state of rest, in which the initial pull of the horses is applied directly to a ratchet wheel fixed in the car axle. This car starter has now been at work for four months on a car on the Mission street line of horse cars in this city, and has done its duty satisfactorily to the Superintendent, who acknowledges that its use materially helps the horses in starting the car and that it is simple in structure and durable. The engraving on this page shows the device as applied to a one-horse car or a two-horse car without a pole.

A represents one end of a street car and B the axle which connects the wheels at that end. D is the ratchet wheel, which is firmly fixed to the axle. This wheel is made in two parts, so as to be bolted on without taking off the wheels, and is formed with side flanges, which extend above the teeth on each side. The dog, or pawl, E, is pivoted at its middle to one end of a lever, F, the opposite end of which is pivoted to the end of a draw bar, G, so that the pawl will be directly above the ratchet wheel. The pawl is made, as shown, with teeth on its rear end and an enlargement, H, on its forward end, and it is pivoted at its middle to the rear end of the lever, F, the forward end of which is attached by a rivet to the rear end of a draw bar, G. The forward end of the lever, F, passes between two guides, N, N, and has a downward projecting lug, K, at its extremity, against the front face of which the end of a flat spring, L, presses, so that the rear end of the lever is pressed upward against the bottom of the car and retained there until it is necessary to use it, as hereinafter described.

The draw bar, G, extends forward underneath the car floor to a point under the platform near the end of the car, being supported and guided at suitable points by loops, N, N. A casting is secured to the underside of the front beam of the platform, which has a downward projecting arm, O, on one side of which is a stud or pin. A lever, P, passes up through the platform, its lower end having a circular recess which clasps the pin, while its upper end above the platform is attached to the rear end of a bar, S. The forward end of the draw bar, G, has a pin on one side, which enters a hole in the middle of the lever, P, so that when the upper end of the lever is drawn forward the draw bar is also drawn forward.

T is the whiffletree; U is a slot in a small piece of iron, V, bolted to the front end of the platform, over which the whiffletree moves, being attached so that it can move the length of the slot. The forward end of the bar, S, is attached to the middle of the whiffletree by a bolt passing down through the whiffletree and through the slot, thus connecting the whiffletree with the draw bar, G.

Now when the initial pull or draft comes upon the whiffletree, the upper end of the lever, P, and draw bar are drawn forward until the pin in the whiffletree reaches the end of the slot, U. As the dog or pawl, E, was in engagement with the ratchet when the draft commenced, this initial pull is directly exerted upon the ratchet, which by reason of the leverage and direct application of the power, starts the car easily forward. A pawl, W, is attached to the upper end of the lever, P, which engages with a notch or projection, X, in the car floor, when the upper end of the lever has been fully drawn forward and retains the entire arrangement in this position until it is released by the foot of the driver. By this same motion, by means of the connections and the spring, L, the lever, F, with the pawl, E, is raised up so that the pawl stands against the bottom of the car and clear of the ratchet, until the driver releases the pawl, W, when the spring, L, throws the whole arrangement into gear again.

This is intended for one-horse cars, but there is a simple method of disconnecting and clearing the main platform of obstructions, when used on a two-horse car. It can be used with

a pole or without, as desired. The entire arrangement is simple and free from the many objections heretofore urged against this class of car starters. In this class of devices the method heretofore adopted was to connect the rear end of the pole with the pawl which engaged the ratchet on the axle, so that the pole had a forward motion when the first pull came on it. This motion of the pole is objectionable. By Mr. Pritchard's method the pole, when used, is fixed in the ordinary manner and the whiffletree is connected with the mechanism that engages with the ratchet on the axle. The whiffletree is arranged to move a short distance in and be guided by a slot in the rear end of the pole, or a slotted bar and link, such as is described, when no pole is used.

The use of this device is a great relief to the horses, inasmuch as the labor of starting the load is greatly lessened. The Oakland Society for the Prevention of Cruelty to Animals, after examination, passed a resolution urging the adoption of this car starter on the different lines,

PRITCHARD'S IMPROVED CAR STARTER.

believing that it would be beneficial to the horses. The car does not start with a jerk when this device is used, but moves slowly at first, which will be a relief to passengers and avoid many accidents. Those desiring further information can address the inventor at No. 1006 Minna street. It may be well to state that the device can be applied to one-horse cars for an expense of \$20 each.

MARIPOSA ESTATE.—The Mariposa Land and mining company have won again in the action brought in their behalf, as well as his own, by

Enlarged Limnoria.

F. D. Walker, against Eugene Kelley and Joseph A. Douahoe, to restrain them from foreclosing a mortgage upon the Mariposa estate, and from taking any other proceedings against the estate or the personal property upon it. An injunction was granted by the Supreme Court of New York, sitting in Kings county on the 4th of October last, restraining such action. The Supreme Court, on the 28th inst., holding that this injunction had been violated, granted an order requiring Kelly show cause why he should not be punished for contempt of court.

BRITISH COLUMBIA MINES.—A dispatch from Victoria says: The formation of quartz mining companies proceeds briskly. New discoveries at Cariboo are reported daily. The two latest are the Wilkinson ledge, assaying \$90 in the outcroppings, and the Richfield ledge, assaying \$166 to the ton. These assays are made at the government office.

OAKLAND city property is valued by the assessment \$25,845,028.

The Wood Boring Shrimp.

The *Limnoria Terebrans* is a crustacea of the *Isopoda* order. The *limnoria* is about two lines in length, or about the size of a grain of rice, and of a dark ash gray color. The front outline of the body is a long oval, though the head is large, round, and strongly defined. The eyes are black, and are composed of numerous ascelli placed close together. The general appearance is like that of a wood louse. When disturbed or handled they roll themselves up like a hedgehog. These little creatures are wonderfully destructive to submerged timber, such as piles, docks, piers, bulkheads, etc. In the Bay of San Francisco they eat piles off entirely in a short time. The contents of the stomach consist of comminuted wood, showing that food is the object sought. They attack a

pile about half tide. The *limnoria* swarm around the timbers attacked in great numbers. They excavate little cells along the annual rings of growth, and while eating the wood for its albumen, as is presumed, make a sheltering place for protection from enemies, and in which to breed. The outside of the wood has a spongy look, and is very frail. A mass of these perforations as large as a hase ball taken into the hand and the water squeezed out leaves a mere

A Pile Eaten Off by Limnoria.

Knots Left by Limnoria.

pulp of woody fiber many times reduced from its original bulk.

The illustrations on this page show this timber-boring shrimp enlarged seven times. Another engraving shows the appearance of a pile eaten off by *limnoria*, and another shows how they leave the knots in their work. Mr. John P. Culver, an engineer of this city, has been investigating the habits of these creatures, and also the *Teredo navalis*, and has devised a plan to prevent their ravages, which we shall shortly describe in detail.

A VERY gratifying feature of this New Year's day in Washington was the general absence of wines and other intoxicating beverages from the tables of persons, either in public or private life, who received visitors. Washington has set at least one good example to other cities.

The steamer *Whipple* and *Chin-du-wan* collided during a fog in the Sacramento river, one day last week. The injuries were comparatively slight.

Double Seal Valve Trap.

We examined this week, at the model and machine shop of I. A. Heald, 514 Commercial street, a new sewer trap of peculiar construction, the invention of C. W. Garland of Oakland. The trap is of the same general shape of those commonly in use, its peculiarities consisting in the method adopted for shutting off the sewer gas, and preventing the siphoning off of water, which is the great drawback to most traps. In the proper place in the curve is a chamber in which a hollow ball is fitted, and this acts as a valve. When water is passing through the ball floats, and when it has stopped running the ball falls to its seat and shuts off any gas that may attempt to rise, remaining in this position when no water is passing. It also acts as a seal against the results of fermentation and prevents evaporation.

On top of the valve chamber is another small vertical trap. This is screwed in the top of the main chamber, and as soon as there is a tendency in the water to siphon off the little ball in the vertical trap stops the flow of water by admitting air proportionate to the bulk of water which has escaped. This valve takes the place of vent pipes and no sewer gas is allowed to escape into the air, as, while the ball admits air to prevent siphoning it also prevents any air or gas getting out, confining it within the pipes and sewer. Without this valve, when rooms or houses are not in constant use and the water in an ordinary trap evaporates, the pipes act as a chimney for the induction of sewer gases. The whole arrangement is very simple taken as a whole, although it was somewhat difficult to make the first models. In fact, Mr. Garland tried to have the models made by several others before Heald took hold of it. The ball valve has to be made in halves in order to have it hollow, and in joining the halves together afterwards it was found difficult to have it exactly spherical. Those made by Heald are very true. The ball is weighted so that the same side falls into the seat each time it operates making a perfectly water-tight joint. The little vertical valve is a perfectly new idea and does away with the necessity of vent pipes, making a perfect double seal valve trap. The first ones have just been completed. Mr. Heald having just finished the model, but they will soon be on sale at the various plumber and hardware stores.

BLACK HILLS MINES SOLD.—A dispatch from Deadwood, D. T., states that the Golden Gate mining company has consummated a sale of their four mines, the Father Desmet, Golden Gate, Justice and Belcher, to California capitalists, for the sum of \$400,000. This is the heaviest mining transaction that has occurred in the Hills. This being the case we shall probably see some Black Hills mining stock on the market before long, unless the mines are unusually rich, when the buyers will keep the stock themselves.

COMPLETE returns of the business transacted at the Bankers' Clearing house in this city for the year 1877 show that the total amount of exchanges effected during that period was \$519,948,804, of which \$497,407,380 was in gold and \$22,541,424 in silver.

THE settlement at the Mint preparatory to the incoming of the new Superintendent, is now in progress. During the year now ending the operations of the Mint have been unprecedented in the record of coinage in any institution in the world.

OFFICIAL intelligence has been received announcing the success of the Chinese troops in Kashgar. They had fortified Touchtonggan and Ask, two strong strategic points. The inhabitants were fleeing in terror into Russian territory.

SEVENTY-FIVE THOUSAND tons of Scranton coal were sold at auction at New York Friday by order of the Lackawanna Company. There was a large attendance, and prices were from 10 to 45 cents per ton more than last month.

CORRESPONDENCE.

It is the desire of the editors of this journal to be liberal toward all correspondents, and therefore statements and opinions are frequently published, on the authority of the writers, for which we do not assume responsibility.

Report of the Entomological Commission.

EDITORS PRESS:—The U. S. Entomological Commission, which was organized and placed under the auspices of Prof. Hayden's Geological Survey, for the purpose of investigating and reporting the entire subject of insect ravages throughout the western regions of our continent have completed their field labors for the present season.

The members of the Commission have been busily engaged in the preparation of the several parts of their annual Report, and will soon meet in Washington, where they will have a protracted sitting to get everything ready for the printer. This Report is looked for with much interest by the farmers of the West, and the character of the Commissioners is a guarantee that it will be creditable from the scientific, and valuable from the practical standpoint. The Report will contain 16 chapters, under the following heads: Introduction, Riley; Chronological History, Packard; Statistics of Losses, Thomas; Classification and Nomenclature, Thomas; Geographical Distribution, Thomas and Packard; Migrations and Meteorology, Packard and Thomas; Original Permanent Breeding Grounds, Riley, Packard and Thomas; Habits and Natural History, Riley; Embryology, Packard; Metamorphoses, Riley and Packard; Invertebrate Enemies, Riley; Vertebrate Enemies, Thomas; Remedies and Devices for Destruction, Riley; Prairie Fires vs. Locust Injury, Riley; Agricultural Bearings of the Subject, Thomas; Ravages of other Locusts, Packard and Riley; Locust Ravages in other Countries.

These chapters will embrace many sub-chapters, and the Report will be as exhaustive as the limited time for its preparation will permit.

In chapter four, the western extension and the northern and eastern limit of the species range are fully given.

In chapter five, the laws governing locust migrations are for the first time defined. A very large number of data have been collected in reference to the subjects of this chapter. Not only are the general laws governing the movements of the insect now defined, showing a regular migration southward and return migration northward, which may be counted on and foreseen; but many important and highly interesting facts in reference to their local flights are brought to light, which will henceforward form a part of the history of the insect.

In chapter seven, several other laws governing the species are also added; and the importance of the discovery of the laws which regulate the doings and movements of the pest, cannot be overestimated. In said chapter seven many new facts will for the first time appear, and all that is definite and accurate be made known.

Locust Destroyers.

In chapter 10 many new discoveries will be recorded, some of them of great scientific interest and importance. Of these may be mentioned the transformation of the silky mite (*Trombidium sericeum*). This is an eight-legged creature, which preys on the locust eggs. It is proved to be the mature form of the little six-legged mite (*Astoma gryllaria*), which is parasitic on the locust. Insects described under different genera are thus proved to be specifically identical. The life history of the blister beetles will also be given, their larvae feeding upon locust eggs and undergoing similar changes called hypermetamorphoses. The interest attaching to this discovery among entomologists as well as among farmers, is best appreciated when it is considered that absolutely nothing has heretofore been known of the larval habits of these blister beetles, notwithstanding the fact that for half a century much attention has been given to the subject by scientific men, on account of the commercial value of cantharis or Spanish fly, and of the great injury to potatoes and other plants committed by several of our American species.

In chapter 11 are given the locust feeding habits of many western animals not heretofore known to have that habit, and the good offices of birds are especially made manifest, examinations of the stomachs of over 90 species and 630 specimens having been made with special reference to their locust eating habits. The record in reference to these examinations is very full, giving the date, the locality, the common and scientific names of the species, and the number of locusts and other insects found in each. The value heretofore placed on these aids by entomologists is fully sustained by this record.

In chapter 12, which will be one of the most extended and most important practically, it is clearly shown that the young locusts may be

controlled, and by what means; while the way is pointed out how to better control the winged insects. Many valuable devices for destruction will be illustrated, among them one invented by Prof. Riley, which gave great satisfaction and will, it is believed, supersede all others as a cheap and practicable remedy, applicable at any season, whether the plants or the insects be small or large.

Losses by Locusts.

In chapters two and four are given statistics showing the immense losses inflicted on our western agriculturists by the locust. These chapters also show what crops are most liable to injury, and what are most easily protected—also the best methods of cropping in order to reduce the injury to a minimum. A chemical analysis of the dead locusts has been made and is unusually interesting. The insects furnish a new oil, which will be christened "caloptine," and a very large percentage of pure formic acid. Though this acid exists in the ant and some other insects, it is with difficulty obtained in large quantities, whereas by the action of sulphuric acid upon the locust juices it passes off with great readiness and in remarkable quantity and gravity. The various uses of this acid, whether as a therapeutic agent or as a laboratory reagents, etc., are capable of great and valuable extension, when it once can be obtained so readily and in such quantity.

The Report is expected to make about 500 pages, and will, it is hoped, be published in February or March. Although the Commissioners have divided the labor among them, the Report will form one complete whole, as the work of each will be discussed and revised by the Commission as a whole.

The annual Report, which is intended more particularly for the practical farming public, will be followed by memoirs of a more purely scientific nature—one by Dr. Packard on Anatomy and Embryology; one by Prof. Riley on the Natural History of other Locusts; and one by Prof. Thomas on the Classification of the Acrididae.

While it has been the object of the Commission to cover as much ground as possible, so as to make the annual Report as full and valuable as the time would permit, there yet remains several important subjects that it has so far been impossible to properly and exhaustively study. The territory affected is so vast, embracing over 1,000,000 square miles, that much of it was imperfectly explored, especially in the northwest. Mr. Riley had to cut short his investigations in British America, both for want of time and want of funds. For similar reasons, and on account of Indian troubles, Montana, Wyoming and Dakota have been but superficially explored.

Items of the Work.

The year 1877 was an abnormal year, i. e., the insect had, the previous year, overrun a large section of country in which it is not indigenous, hatched in such country in the spring. This was most fortunate for many reasons, as it enabled the Commission to carefully study the insects in this their unnatural condition, and to carry on experiments with a view of learning how to control them. Much of the work of the Commission was with these young insects. The losses sustained through the devastation of the pest by young and struggling frontier populations, ill able to bear them, was immense; and there was so much discouragement that hundreds and thousands of persons were on the point of abandoning their new homes last spring. At this juncture the Commission went into the field, and by its encouraging predictions (which were all verified) and commendations inspired the people with hope and confidence, and drew westward again the emigration that had almost stopped. All this work, however, interfered with needed investigations into the proper range, the native home and breeding grounds, the source of swarms, and many other important questions which can only be properly studied during a normal year. It is, therefore, very important that the investigations be continued until every question is settled that human investigation can settle.

For the proper settlement of some of the questions, the co-operation of the Dominion Government is desirable, and has been promised by the Canadian authorities, if the work of the Commission should continue.

It will be unwise to stop the work of the Commission before completed. The work should be made so thorough as to obviate any necessity in future years of creating another Commission for the same purpose. After careful estimates, it is concluded that the work can be satisfactorily completed only with two more years' investigation and experiment. The Commission therefore ask for a continuance of the appropriation of \$25,000 asked for a year ago.

There are various other injurious insects of national importance of which much has yet to be learned, and in addition to completing the locust investigation, the Commission contemplate, during the coming two years, studying and reporting on some of these worst enemies to our agriculture.

Much has yet to be done in giving practical form to the conclusions arrived at and plans proposed by the Commission to enable the work already done to bear proper fruit. To bring about the needed co-operation of the two governments, to cause proper laws to be enacted in all the States interested, and to enforce the truths that alone will make man master of the situation, is largely the work of the future.

R. J. S.

Washington, D. C., Dec. 22d, 1877.

The River Beds in Montana.

EDITORS PRESS:—In one of your recent issues I noticed in an article relating to river mining that the dredging machines of Feather and Yuba rivers had not proved a financial success, owing to the tailing deposits in their beds exceeding in places 25 feet in depth, a piece of information that astonished many who mine in countries where mountains are not moved. It is very evident that no machine could be a success with such an obstacle to overcome. But while the rivers of California, in consequence of that fact, offer no inducement to the average capitalist and practical miner, other fields are open where such machines would undoubtedly prove of great value and give enormous returns. It is a well authenticated fact that the Snake river of Idaho is rich in gold. Men have worked its bars and banks for years. On account of its swiftness no wing dam could stand, and its bed to-day, in the minds of all who are conversant with river mining in Idaho, holds millions of the precious metal in abeyance. But more especially to the rivers of Montana is the attention of the dredge-boatman called. The Missouri from the falls to its confluence with the Madison, Jefferson and Gallatin is rich, not one foot of its bed or bank but will give a sure prospect of gold and into it empties some of the richest gulches that have ever been discovered. The famous Confederate paid grandly, and \$100 to the pan was an ordinary prospect. No estimate of the amount of gold taken out has ever been made, but many millions undoubtedly were. El Dorado bar and the famous French bar diggings, also on its bank, gave up their riches, and to-day yield up large amounts of gold. The tributaries named, however, have been the means of enriching the old Missouri. Alder gulch, emptying into the Madison, in four years gave up the enormous sum of \$35,000,000 in Virginia's palmy days; since then millions more have been taken up, and millions yet remain, for Alder will be worked for years to come.

I could not if I wished, enumerate the gulches that have been worked, that empty in the Madison. But suffice it to say that gulches whose richness have astonished the world all have poured for ages into the lap of our grand old river their wealth of precious metal, and no more inviting field in the world is open to the capitalist than working the river beds of Montana. A large and sure return of gold is his reward, who shall venture, and no practical man understanding river mining can fail to meet with success and assistance by coming here. It is a new field and the outlay of capital is a most trifling one in comparison with the return that must inevitably be made. The bed of the Missouri and its banks are heavy deposits of gravel and throughout gold is evenly distributed. Working it by the ordinary process where its bed can be reached it will and does pay \$2 per man a day; what will it pay then if worked by a process that handles 130 tons an hour. Surely the most incredulous must, in the face of these facts, admit that there is money in it. Not an island on the river, between the points named, but is formed of gravel, and all of them ready at once to affirm the truthfulness of my assertion by showing gold in every pan of dirt taken from them. Then again there is no tailings to interfere with the successful working of the river anywhere. So gentlemen if your boats are not a success in California don't destroy them, don't let them lay up and rot, your machinery go to the scrap-heap; but gird up your loins, and with the indomitable energy of men determined to succeed, seek new fields and pastures. Come to Montana, and here you will find money and men willing and glad to assist in the development of their internal resources. The generous spirit that characterized the early Californians is a part of every Montanian, for a more liberal whole-souled people does not to-day live than they, for the truth of this no one will gainsay who has ever visited them. Her mines to-day are paying largely, the richest silver quartz that is taken out on this continent comes from her butte mines. Her placers will last years yet, and all through the Territory mills are pounding away on gold rock that pays largely. The opening of a new field, then, would give employment to much more labor and bring that most desired result, immigration. River mining, being in the minds of all mining men a paying institution, no trouble will be incurred by any one who has experience and machinery in raising capital enough to work on. To all such men Montana and Idaho send greeting.

SAND BAR.

Helena, M. T.

The Ice Works.

The ice manufacturing machinery is being put in place in two large buildings on the east side of the large reservoir of the water company on the divide. In one of the buildings is already in place a boiler and the foundation of the engine which is to drive the machinery is about completed. Adjoining this boiler and engine house is a larger building, in which is being set up the ice-making apparatus. Among this the most noticeable object is a tank of heavy sheet iron 30 feet long, 8 feet wide and 4 feet deep. In this will be placed the pans in which the ice

will be made. These pans are of galvanized iron and are 140 in number.

Among these pans circulates the brine, or non-congealable fluid, which, by its coldness, turns the water in the pans into ice. This cold fluid comes into the tank from a coil of pipe somewhat resembling the worm of a still, and from the tank passes back into the worm or coil of pipe. By means of a pump it is kept constantly circulating through the tank and coiled tube.

During that part of its journey when it is passing through the worm, the fluid is made intensely cold by the gas of a very volatile fluid called chymogene, which is let into the tank in which the worm is coiled. This chymogene has, also, its coiled tube or worm, into which it retires after it has done its work about the coiled tube containing the non-congealable fluid that freezes the water. In its coil or worm it becomes a fluid, but when it passes out into the tank it assumes the form of a gas, and in so doing produces an intense degree of cold. It is made to circulate by means of an air pump. The two pumps used are run by the steam engine, now being set up. The tank in which the chymogene is condensed is circular in form, and weighs 27,000 pounds.

It is expected that the apparatus will be ready to be started up about the 1st of January. It is warranted to make 20 tons of ice per day. In order to do this a hatch of pans of water must be frozen every five minutes.

The ice at present used by the honanza mines is brought from the Sierra Nevada mountains, and delivered here costs about \$20 per ton. It appears that when the supply of ice put up here was exhausted the ice companies in the mountains raised the price there, and the railroad company raised the price of freight; in self-defense, therefore, the ice machine was procured. Exactly what it will cost here to make ice with the apparatus is not known.—*Virginia Enterprise*.

Aurora District.

Some time since, when the Leopard mine was paying dividends, and Cornucopia was alive with miners, a party of prospectors discovered new mines near the fork of the Owhyee on the Winnemucca and Cornucopia road. Quartz was found in abundance and several claims located. A new district, called Aurora, was organized, a town site located and a few holes sunk on the principal leads. Two lots of ore were sent to the Humboldt reduction works here and worked \$83.80 and \$199.40 per ton, respectively. That was not considered rich enough to pay, as it had to be hauled here by wagons, a distance of over 80 miles, and work on the mines was suspended. Cornucopia experienced one of the "hack sets" peculiar to nearly all mining camps, and in consequence Aurora district was almost wholly abandoned. The discovery of the Grand Prize at Tuscarora, and the revival of the mining business at Cornucopia has led the owners of the Astor mine, at Aurora, which produced the ore worked at the Humboldt reduction works, to make arrangements to prospect the mine. For this purpose a company was organized in San Francisco and operations have been commenced on the lead. A shaft has been sunk to a depth of 50 feet, at the bottom of which the ledge is represented as carrying about two and a half feet of ore that assays from \$80 to \$1,000 per ton. The President of the company recently visited the mine and is so well pleased with the prospects that he recommended the levying of an assessment to develop it to a greater depth, with a view of building a mill in the spring. The indications are that the district is situated in the mineral belt which runs northward from Tuscarora and that the mines will prove equally as rich and extensive as those of that now celebrated camp. As Aurora is nearer Winnemucca than any other point on the railroad, it may be considered selfish in us to hope that it may prove one of the richest mining districts in the State, but that is certainly our wish.—*Silver State*.

CAGE AND CAR IMPROVEMENTS.—A new cage floor, composed of iron bars about a quarter of an inch thick, with about an inch space between, is now used at the Consolidated Virginia. Through this space the air in the shaft escapes to the surface and its resistance as the cage goes up or down is reduced to a minimum. To prevent the miners from slipping off the cages, a false brace has been devised, which is slid on the uprights of a cage whenever men are to be carried. This brace consists of an iron bar, half an inch thick by one and a half inches in width. One is put on each side of the cage. These braces have not been introduced in the other mines, but they soon will be. Another very useful device which is just being brought into use is a car truck, the axle of which is hollow. The wheels on one side are loose on the axle and revolve freely, while the axle remains stationary, and on the other side the wheels are tight on the axle, which revolves with the wheel. The axle being hollow, it will hold about a quart of oil and need not be oiled oftener than once a week. But the main advantage to be secured by the use of the new truck will be in making curves, the wheels on the shorter side of the curve remaining stationary or rotating slowly, as needed, while those on the longer side of the curve will revolve rapidly. And this is the special object of the invention; it is to enable carmen to make curves easily and thus effect quite a saving in the wear and tear of rails, trucks, etc.—*Virginia Enterprise*.

MECHANICAL PROGRESS.

The Indian Prize for a Ramie Machine.

INASMUCH as several Pacific coast inventors are now practically engaged in the honorable contest for the Indian award for a ramie cleaning machine, we give some facts from the circular which has been issued from the India office in London, on the subject. What is required is a machine or process capable of producing, by animal, water or steam power, a ton of dressed fiber of a quality which shall average in value not less than £45 per ton in the English market, at a total cost, including all processes of preparation and all needful allowance for wear and tear, of not more than £15 per ton, laid down at any port of shipment in India, and £30 in England, after payment of all the charges usual in trade before goods reach the hands of the manufacturer. The processes of preparation are to be understood to include all the operations required subsequent to the cutting of the stems from the plants in the field until the fiber is in a condition fit to be packed for conveyance to the market. The machinery employed must be simple, strong, durable and inexpensive and should be suited for erection in the plantations where the rehea is grown. It must be adapted for treatment of the fresh stems, as cut from the plant. The treatment of dried stems offers certain difficulties, and the fiber prepared for them must, moreover, always be much more costly than the fiber produced from green stems. It is, therefore, desirable that the attention of inventors should be given to the discovery of a process for the treatment of the green stems.

The trials will be held at Saharanpur, in the Northwestern Provinces, in the months of August and September, 1879. Machines entered for competition should be ready for trial not later than August 15th, the competition commencing the next day. The judges will be appointed by the government, and they will watch the whole of the trials. But the machines are to be worked and adjusted by the competitors themselves. The government will provide accommodation and motive power at Saharanpur for all competing machines, and will also pay for the transport from the seacoast to Saharanpur of all machines up to the limit of one ton each, the freight on excess weight to be defrayed by the owners. The owner or owners of the successful machine or machines shall not be entitled to receive the reward offered, except on the following conditions, viz.: That a complete technical description of the machine, illustrated by plans drawn to scale, shall be prepared and published (government paying the cost) for the information of the public, and that after the expiration of three years from date of award, the public shall have the right of manufacturing similar machines, on payment to the owner of a royalty of 10% on the cost of each machine so manufactured. All persons desiring to compete are requested to make known their intentions not later than December, 1878, giving their name, residence, profession and a brief description of each machine entered for competition. They must also declare themselves bound to conform to all rules which may be prescribed by the judges appointed to conduct the trials. All notices of intention to compete and applications for information should be addressed to the Secretary to the Government of India, Department of Revenue, Agriculture and Commerce, Calcutta.

How an Axe is Made.

A writer in the *Polytechnic Review* describes the process of axe making as now practiced in our largest American factories. There are several departures from the old method, and these we note as follows: Formerly the polls or heads of axes were made by drawing down a bar of iron from the middle each way, leaving the thick part for the head, the thin portions forming the eye and the embracing flaps for the reception of the steel hit. But it was found that the welded portion below the eye was liable to split in use. The present method is to form the poll from a solid bar of iron. This is done by a machine that operates two punches simultaneously to form the eye for the reception of the handle. The attendants of this machine take the bar and, after heating it, place it under shears that cut off a piece just sufficient for the poll, which piece is placed in the machine, the two punches working from either edge, a supplementary punch finishing the eye and a set of dies forming the sides, when the poll drops, still red hot, ready to receive the hit. There is no welding around the eye by this method, and consequently no danger of producing a "cold-short." After the insertion of the steel hit and shaping the axe are done by ordinary forging.

The axes are then sent to the hardening and tempering room, which is partially darkened, so that no ray of sunlight is admitted to mislead the workman, who depends entirely on the sense of sight for the perfection of his work. The hardening ovens are circular, having a vertical shaft in the center to which are attached rotating tables, on which the axes are laid with the hits toward the outside. The table turns slowly but continually, bringing the axes over furnaces of anthracite coal alternating with spaces. When brought to the proper redness by heat, the axes are hung on hooks on a revolving frame, the hits dipping into a tank of brine,

which is kept in constant circulation by a pump. When cool, the axes are brittle and must be tempered, which is done by heating them in a rotary oven like that used for the hardening, except that the fuel used is charcoal. One of the batch of perhaps 200 which are tempered, or drawn, at one time is brightened, and serves as a test of all the others, the rotary action of the shelves insuring equal heating. When the brightened axe shows the right color, the entire batch is removed, and are then ready for subsequent finishing operations of grinding and polishing. One axe out of each batch is broken after tempering to test, not only the temper, but the quality of the steel. The grinding is done on Nova Scotia stones from six to seven feet in diameter.

DRILLING FOR PRIZES IN COLORADO.—A contest of considerable interest to all rock drillers was held in Colorado recently. The *Sunshine Courier* says that at the recent Boulder county fair, \$60 and \$35 were offered in premiums to the pair of men and single man who drilled the greatest depth in granite blocks in 10 minutes' time. The contestants were to furnish their own tools. The match was open to the whole State. No limit was fixed to the number of drills used by each within the allotted time. The *Sunshine Courier* presented the result thus: The Yates Brothers, of Sugar Loaf district, won the double handed match, drilling 16.2 inches within the given time. C. M. Johnson, of Corning tunnel, won the single-handed match, drilling four drills, and reaching a depth of 9.1 inches. We presume the men were sadly "blown," at the end of the 10 minutes; since the fact is, that the least depth—5.3 inches—is extra work for a man when not working against time.

ILLUMINATED NUMBERS.—The *Telegraphic Journal* says that a contrivance for rendering the numbers of houses visible by night is becoming general in Paris. It consists of a hollow triangular prism nine inches long, two of whose sides are formed of panes of blue glass, on which the number of the house is picked out in white. This prism-shaped lamp-glass rests against the front of the house, so that the two sides with the numbers on them can be plainly seen by the passers-by. In the interior of the prism is a gas jet, fed by a pipe from the house. Householders on the Avenue de l'Opera have been obliged to supply this mode of numbering at their own expense on the houses they are building, and the municipal authorities have introduced it on some 450 of the municipal establishments, schools, police offices, fire brigade offices, etc.

NEW SEWING MACHINE MOTOR.—We read in Eastern exchanges of a new sewing machine motor, which is said to be "so cheap and so simple that it seems as if it would at once come into very general use. The motor consists of a tubular boiler 18 inches high, incased in cabinet work, through which steam is engendered by a small parlor lamp being placed underneath it. The apparatus which connects it with the sewing machine is very simple, and consists of only three pieces. It takes only a few minutes to get up steam, and the speed is regulated by a little spring. The invention is compact, neat and clean, a great savior of health and strength, and in appearance resembles a little parlor stove incased in cabinet work. The inventor of the machine is Mr. Thomas T. Wood, of Newark, N. J."

REMOVING A WRECK WITH HERCULES POWDER.—A Cleveland paper tells of the venture now being made to remove the hull of the steamer *Great Republic*, from the river at St. Louis. The stern lies in about 40 feet of water and the bow on shore. Divers go down into the hull and scrape the mud from off the bottom planks and then place a row of cartridges of Hercules powder entirely across the inside of the hull, cover them with mud, and explode them with an electric battery. The result of this is to cut off a section entirely across the hull, which is easily hauled out into the river and disposed of. About 12 feet-sections are to be taken at a time, and by the valuable services of "Old Hercules" (the explosive in use) the remains of the once grand steamer are quickly, but not quietly, disappearing from sight.

IMITATION OF MARBLE.—According to Herr Karl Boschan and the *Polytechnic Review*, casks of gypsum or papier mache can be prepared to closely imitate marble, by the application first, of a coating of thick Damar varnish, giving the appearance of alabaster, and upon this, when dry, a second coating on which crystallized gypsum is sprinkled, not too finely ground. This procedure is in imitation of nature, for alabaster is composed of very fine crystals of sulphate of calcium, and Carrara marble of somewhat larger crystals of carbonate of lime, which reflects light and glitter similar to crystallized sugar; the same effect is produced by the crystals of gypsum.

Bronzing Cast Iron.—The bronzing of cast iron can be accomplished, according to Dr. C. I. Durre, by coating the surface of the iron (cleaned by acid and well etched) with ferro-cyanide of copper, applied with linseed oil. Before this coating is entirely dry, the bronze powder is applied by means of a fine brush, and then well polished by means of a burnisher. After the surface is entirely dry, it is well washed and etched to the color desired. The use of the alkaline sulphides for the etching produces olive-green and black colors, which closely resemble those on the Japanese bronzes.

SCIENTIFIC PROGRESS.

A Prescription for Phylloxera.

An Italian, Signor Torrionetti, has been treating the phylloxera evil very much as doctors treat a compound malady, by applying a remedy made of ingredients to reach all points. He aims to invigorate the vine and at the same time kill the insects. A German agricultural journal thus describes his process and its results: Having observed that poor land is particularly favorable to the development of the phylloxera, Torrionetti lays great stress upon the necessity of liberal manuring in conjunction with the application of such chemical agents as may be employed for the direct destruction of the pest. In his own practice he uses a mixture of 50 grammes of Peruvian guano, 2 grammes of acetate of baryta, 2 grammes of acetate of lead, and 1 gramme of acetate of zinc, for each plant. The method of application is extremely easy, the mixture being simply put into a small hole about six inches deep at the root of each vine stock, and immediately covered in with earth. The guano furnishes the necessary manure for the nourishment of the vine, and the other three ingredients, as soon as they are dissolved by the moisture of the earth, penetrate all parts of the plant with astonishing rapidity, and cause the death of all insects upon it without the slightest injury to the vine itself. At present Signor Torrionetti has treated about 500 vines in this manner, and has met with complete success in every case.

TESTING THE INFLUENCE OF FORESTS.—Towards the close of last month, says the *London Farmer*, a series of preliminary experiments upon the meteorological influences of forests were commenced at the Botanical Gardens attached to the late School of Forestry at Mariabrunn, a special form of apparatus contrived for this purpose by Prof. Schwackhofer being employed in conducting them. The apparatus consists of a captive balloon furnished with an arrangement for the direct volumetric estimation of the watery vapor present in the atmosphere, which balloon can be quickly inflated when its ascent is desired, by means of a compact portable apparatus for making hydrogen gas that is attached to it. In its ascent the balloon is made to carry up a contrivance for the absorption of air at whatever altitude it may be allowed to come to rest, and in this manner material will be obtained for the analysis of the atmospheric strata immediately above the crowns of forests, and in similar inaccessible places. The preliminary experiments have given every satisfaction as to the feasibility of the scheme, and in the spring of next year a regularly organized system of observations will be undertaken at various meteorological stations in the country.

INFLUENCE OF PRESSURE ON COMBUSTION.—M. V. Wartna has been making experiments on the influence of pressure upon the phenomena of combustion. He has burnt stearine candles in the air at an ordinary pressure, and at a pressure of 1.95 atmospheres in a large iron chest, determining in each case the quantity of matter burnt per hour. Those burning at a common pressure had a flame of 4.5 to 6 centimeters in height, and consumed hourly from 9.34 to 10.70 grams of stearic acid. At the increased pressure the flame was very sooty, of a yellowish-red, and from 9 to 12 centimeters in height, but the quantity of stearic acid consumed was only 7.99 to 9.11 grams. He burnt also candles at very low pressures, as, e. g., 9 centimeters of mercury. The flame was much increased, lost its brightness, and took a greenish-blue color. Three portions could be plainly distinguished—the central part of a greenish-blue, quite detached from the wick, and having the form of a cap. This part is enveloped in a violet mantle, and this again in a second violet mantle, so pale as to be scarcely visible.

CANADIAN ENTOMOLOGY.—To the Canadians belongs credit for maintaining an entomological society in vital form, and the *Canadian Entomologist*, which is the organ of this society, can claim a like preeminence in the entomological literature of this country. The editor, Mr. Wm. Saunders, is well known, and has rendered good service toward the increase of entomological knowledge, both by his investigations and his general writing on the subject. The *Canadian Entomologist* is published at London, Ontario, Canada, and serves a record hook for the latest advances in the science of insects. We notice that many of our eminent United States entomologists use it as a medium of communication. The fee for associate memberships in the "Entomological Society of Ontario" is \$1.25 per year to Americans, which includes a copy of the monthly publication.

TELEPHONE AND DEAFNESS.—The *American Manufacturer*, of Pittsburgh, Pa., says: A new discovery in relation to the telephone has just been made in this city. A gentleman, who is deaf in the left ear, so that he cannot hear through ordinary speech, finds that on applying the telephone close against that ear he can hear even a whisper with perfect distinctness. We may soon see deaf persons with telephones fastened to their heads, instead of carrying ear trumpets.

TRANSPARENCY OF IRON HEATED TO REDNESS.—It has been affirmed by P. Seechi, of Rome, that iron heated red is transparent to light. This is denied by M. Govi, of Turin, who, in a paper to the French Academy, as reported by *Nature*, describes some experiments on the subject, and shows how one may be deceived in studying the phenomena. If a mixture of borax and carbonate of soda be fused in a thin platinum crucible raised to a red heat, there will be seen on the exterior of the vessel the form of the liquid mass with all its accidents of rapidly varying form, indicated by a zone of less brightness than the upper portion of the metallic surface. At first sight it is natural to infer a transparency for light of the heated platinum, but (M. Govi points out) the case is really one of transparency for radiant heat; that is to say, a phenomenon connected with the good conductivity of platinum. The liquid, liberating carbonic acid, is less hot than the crucible, and is constantly borrowing heat from it. It is inevitable, then, that at every point where the liquid touches the metal, the latter relatively cooled, should appear less luminous than in the neighboring region. M. Govi gives some other examples of the phenomenon.

ENGRAVED GLASS.—Very few chemical agents act on glass, the principal one being fluorhydric acid, which is employed for engraving. Its action is, however, very rapid, and its use so dangerous that special precautions must be taken. Another and a safer way of engraving glass than that with this acid, the *Jeweler* gives as follows: A coat of engraving varnish is put on the glass with a pencil. The varnish, which goes by the name of "Florence," is one of the best. It is heated in a varnish pot and linsed oil and mastic in drops are added in equal portions. Mix and pass through a cloth. Keep in closely stoppered bottles. The varnish is spread so as to leave the parts to be engraved uncovered, that the drawings may be traced with a metallic point. A paste of fluoate of lime in powder and concentrated sulphuric acid is put on in a thin layer. This paste acts slowly on the glass wherever it is not protected by the varnish. It is left for two or three hours. The glass is then cleaned first with water and afterward with alcohol.

EXPLORATION IN THE INDIAN SEAS.—Measures are afoot, (the *Athenaeum* says) for supplementing the researches of the *Challenger* expedition by a series of deep-sea dredgings in the Indian seas. These seas were purposely omitted from the scope of the *Challenger's* investigation, as it was then hoped that the establishment of a marine surveying agency would enable the Indian government to carry on deep-sea dredging and sounding *pari passu* with coast surveying. But although the Duke of Argyll warmly approved of the object, it has hitherto been impossible to do anything, owing to the want of a good steamer and all necessary equipment. A new steamer is now being built in India, and an officer of the Coast Survey Department, Lieut. Jarrad, R. N., has been commissioned to see after the fittings and dredging appliances in England. It is hoped that operations may be started next cold season (1878-79), probably, in the first instance, in the Bay of Bengal.

AERIAL TELEGRAPHY.—The scheme for telegraphing without wires, by means of aerial currents of electricity, has been revived by Prof. Loomis. He has met with success in using kites for this purpose, a copper wire being substituted for the usual kite string. Signals were transmitted thus between kites 10 miles apart. His new experiments are made in the mountainous regions of West Virginia, between lofty peaks. Continuous aerial currents are found at these altitudes, which will serve the purposes of the telegraph, except when rarely interrupted by violent disturbances of the atmosphere. A scheme is now on foot to test the merits of aerial telegraphy in the Alps. The cheapness of the apparatus, as no wire is required between the stations, is greatly in favor of the method, and may counterbalance its liability to occasional interruption.

THE LICK TELESCOPES.—The *Manufacturer and Builder*, alluding to the proposition to erect two telescopes with the Lick fund, one a great refractor of the largest possible size, the object glass at least 40 inches in diameter; the other a reflecting telescope, of which the mirror should be at least four feet in diameter, adapted to use two kinds of mirrors, one a speculum metal reflector, and the other a silvered glass reflector, says: "We are confident that if this plan is realized, startling discoveries are in store. California, with its monster telescopes, aided by its clear sky and otherwise favorable situation for astronomical research, will undoubtedly take the lead in discoveries, of which those of the moons of Mars, made with what is now the largest refractor in the world, have given us a foretaste."

STRAIGHTENING TOOLS.—The *Polytechnic* says: It is not generally known that steel tools sprung in hardening can be straightened in tempering. Hardened steel, when not enough to change the color to straw color or purple, is about as pliable as annealed steel when cold. So pieces warped in hardening can, while hot, be straightened with a hammer, or, better, with a screw-press, without danger of breaking.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

AMADOR.

LAVA BEDS.—Amador Ledger, Dec. 29: The peculiar deposits known as the Lava beds, on the line of the main mineral belt, about one and a half miles from Drytown, continue to prove immensely rich in gold. The formation consists of a kind of decomposed quartz, which carries a heavy percentage of metal. A party of Mexicans have been plucking along there for many months, keeping very quiet about their success. There are good reasons for believing, however, that the results obtained rival the palmy days of '49. The workings are on a ridge, and the rock is packed in a bag to an arastra, and there crushed. The quantity of gold they are gathering in is astonishing. The last few weeks, it is said, they have panned out \$4,000 or \$10,000. One of the miners there stated to a passer-by that one day last week they cleaned out \$4,000. Within the past week \$3,200 worth of bullion has been sold in Jackson. The ownership of the ground where these results are obtained is in dispute.

MOORE MINE.—We are gratified to learn that everything moves along satisfactorily at this claim. The work of re-tilting the shaft was completed sooner than was anticipated, owing to the fact that below the water mark the timbers were found to be comparatively sound. Putting up hoisting apparatus is now in order. Knight & Co. have contracted for the erection of machinery to be run by water power, capable of sinking the shaft to a depth of 400 feet.

PLYMOUTH.—J. A. Davis' quartz mill will be run by water power from Dry creek, brought through the ditch just repaired by the Phenix company.

The big mine of the American Flat company, at Fiddletown, is two weeks from completion.

AMADOR CITY is overrun with miners seeking employment.

The Original Amador is running 10 stamps. Considerable prospecting is being done in the mine.

CALAVERAS.

SAN ANDREAS GRAVEL CLAIM.—Calaveras Citizen, Dec. 29: This claim, situated about one mile from town, is being vigorously worked. The mine has been entirely drained of water and the new tunnel is now in 60 to 70 feet. The gravel taken from the mine shows gold. At present 10 men are employed in the mine.

RAIS.—Calaveras Chronicle, Dec. 29: The first really heavy rain of the season occurred Saturday and Sunday last. Copious showers fell, and as the weather has been "threatening" all the week, we conclude the storm is not over yet. There has been a heavy fall of snow in the mountains, extending as far down as Alabama hill, near Rich Gulch Flat. For all that, though, there is not half a ditch full of water and our hydraulicists are still "sitting on the ragged edge"—or seat. The cold weather has frozen the sources of water supply and the chances are that it will keep them locked until next season.

WEST POINT MINING.—Champion still sinking. The indications that the mine will continue to pay largely were never better than at present. Excellent ore is being taken from the north level of the Enterprise Con. Rock is accumulating on the new level, but not being any water to run the mill. When the crushing machinery can be started the yield of the mine will be large. The Zactero mine is running and work is progressing in all the claims in the vicinity.

MOSQUITO GULCH ITEMS.—Peter Gass & Co.'s mine has been sold to a San Francisco company, who took possession last week and immediately commenced work on same. Six men are now employed. J. J. Holmes, Superintendent; John V. Brown, formerly of San Bruno, is foreman. Price paid, \$3,000. Banner mine is being energetically worked and rich rock has been struck in sinking. About 20 men are employed. Holmes mine still continues to produce rich rock, and work here is being energetically carried on. Grand Central shaft is down 120 feet. Work is being systematically carried on under the supervision of J. L. Hoey.

EL DORADO.

IRON ORE.—El Dorado Republican, Dec. 27: Some months ago an iron mine was located about three miles southeast from this city. The mine was partially developed some years ago in prospecting for gold and copper. A substance was found that was supposed to be copper, and a quantity was sent to San Francisco to be assayed. The report came back, "80% chrome iron." Not knowing the value of it, the parties engaged upon the mine abandoned it. During the past year the mine has been relocated and negotiations are now pending for its sale to an Eastern company. There can no longer be any doubt about the value of this property, as it has been visited and thoroughly investigated by several parties familiar with iron mines and iron manufacture, and all pronounce it valuable. In addition to the iron upon this property, there is an abundance of limestone and also fine articles of marble and an abundance of wood.

INYO.

ALABAMA DISTRICT.—Inyo Independent, Dec. 29: Jimmy Sharp is still patiently working away at his little gold ledges in Alabama district, some 10 miles south of town. The seams and strata vary from one to eight inches in thickness, but are immensely rich in gold—a peculiarity of Sharp's single-handed quartz mining being that he makes it pay. He works the finest pieces into jewelry sets, crushes out the balance by hand and then manufactures the gold into rings and bangles. We are promised of a beautiful piece of hard, brown quartz, flecked all over with the yellow metal, which came from a small feeder among the number which lead into the main ledge. The latter he calls the Sioux, which stands perpendicular and carries from four to eight inches of fine milling ore. The Hitchcock boys are working an equally valuable ledge in the same immediate vicinity. From all descriptions of the place, we believe that a deep prospect shaft would show up something wonderfully rich if not extensive.

NEVADA.

GOLD HILL MINES.—Grass Valley Union, Dec. 20: The work of development in the Gold Hill mine is making good progress. The lowest level is down 400 feet and drifts are being run both north and south. The north drift is showing a fine quality of ore, with a vein of 15 inches. In this part of the mine they have 250 feet of backs, which will take a long time to exhaust and which it is confidently expected will give better results. The south drift has not been pushed far enough to show much, but the general opinion of the mine is very encouraging. By the pumping out of the mine, Gold Hill has been completely drained, and it has given the holders of adjoining claims on the hill a start, and, in consequence, a good deal of prospecting is going on, which is likely to be attended by rich strikes, as there is much faith in Gold Hill being able to show a bonanza that will rival her early glories, when it was known as the location of the first gold quartz discovered in the State.

THE PLEVNA.—Foothill Tidings, Dec. 27: This is the name of a new mining location, or rather a re-location of the old Redan ground over at the north foot of Osborn hill, made by the Stewart Bros. of Ophir hill, and others. They have taken out some fine rock of late, but are now down to a depth requiring machinery to reach the water out, which they are trying to secure.

A PROMISING MINE is that of Fleming & Bigelow, over on Deer creek. It is said to have turned out a large amount of rock during the past few months, which paid an average of a little over \$50 per ton. They have a fine pay chute and the mine can be worked for a long time above the level of sea level, thus avoiding the necessity for making assists in.

PLACER.

DIVIDE MINING ITEMS.—Placer Herald, Dec. 29: From Mr. A. Wilson, of Forest Hill, who has been visiting Auburn this last week, we learn that at the Centennial mine, near Todd's valley, work is being pushed ahead vigorously and the gravel is paying well.

PORS & CO.'S GRAVEL.—Todd's valley. Have their hydraulic mines all fitted up in fine condition for washing, and are only waiting for rain enough to fill the ditches. They fired off a big blast recently that did excellent execution.

THE BIG SPRING CLAIM near Forest Hill, run by the May boys, is fitted up for hydraulicking, but in the absence of water as yet the parties are drifting away, determined if they can't get gold one way they will have it another.

THE DARDANELLES. In Forest Hill district, have completed their extensive and expensive season's repairs to both mines and ditches, and have considerable ground blasted. With plenty of water, this company will make things lively.

THE GREEN SPRING, east of the Dardanelles, W. Jones, Superintendent, is fitted in good shape for hydraulicking, but like the other hydraulic mines is waiting for water.

THE HOPE CLAIM, run by the Phillips, they are drifting, and it is understood are doing well.

REMARKS is prospecting and fitting up the Baltimore for future operations.

THE JERSEY, a drift claim, owned by a Welsh company, is now doing well. They have been troubled some with bad air in the past, but this difficulty now being overcome, they are in a fair way to make things tight.

HARRY DAVIS & CO., and Grange & Co., both big claim owners at Statish's point, are, owing to the scarcity of water, preparing to work their claims by the drift process.

TRAPION & HOBBS, at Yankee Jim's, are sinking on their newly discovered quartz ledge, the Badger. They propose to prospect the claim thoroughly.

PLUMAS.

STRECKER RICH.—Plumas National, Dec. 27: We hear it reported that a rich strike has been made in Judkins' Newtown claims within the past week, and that Thursday a washing of 12 tubs of dirt yielded \$50. That is about the figures which the old lead gravel used to turn out, and we hope that Jud. has got it this time, and will be able to keep it for the next 10 years.

SACRAMENTO.

THE CHINESE.—Folsom Telegraph, Dec. 27: The Chinese are securing the right to mine in every possible nook and corner in and around Folsom. These mines undoubtedly pay them well, and while they are making money we shall most assuredly have the Mongolian race well represented here.

SIERRA.

SILVER DISCOVERY.—Marysville Appeal, Dec. 29: S. B. Bie, of Dryden, Nev., favored us with a brief call last evening, and informed us that he was en route to Sacramento for the purpose of obtaining an accurate test of silver ore taken from a newly discovered lode about half a mile distant from Downieville. The lode is 40 feet in width on the surface, and it will pay for working from the top. Six thousand feet on the main lode have been located. Mr. Dore has been prospecting for this silver bonanza for six years, and at last is able to exclaim, "Eureka." The discovery of this lode is an extension of the Nevada mines, as it bears the same mineral combinations and characteristics and lies in the same zone.

TULARE.

VARIANTEO MARBLE.—Iron Age, Dec. 27: Mr. Ragan, of this place, is working some fine specimens of variegated marble quarried 20 miles east of this place. They receive a brighter finish than Italian marble, and for many kinds of work are more beautiful as well as durable. But there is one drawback—being harder and more compact, it is more expensive to dress. There are marbles in this country, however, softer than Italian marble, and it is proposed to saw them for the market. These soft marbles have been found, but, though unsuited for statuary, could be made into beautiful car seat covers, marble shelves, etc., than any marble now in use.

TUOLUMNE.

CHIEFA HUNTING.—Union Democrat, Dec. 29: Sunday morning hunting was quite lively with both boys and men who were out chipping water chaps. Several fine specimens, and it was rumored that one chips of four ounces was picked up near the corner of Washington and Main streets, on a pile of tailings.

PREPARING TO MINE.—Quite a number of claims are being put in order in the neighborhood of Sawmill Flat, Yankee Hill and Summit Pass, by the erection of hydraulic pipe, mostly of the Little Giant pattern, using from 200 to 300 inches water each, and with discharge in capacity of nozzle from four to seven inches. The miners are hopeful of a good supply of water, and a large yield of gold. Sunday all the water courses were running more water than they have for months.

FINE SPECIMEN.—Louis Klefeker and Adam Haag have a splendid specimen from their claim in the mountains east of here of an alloy (natural) of gold, silver and lead. It weighs several pounds in weight, and looks as if it had boiled over in some laboratory, and cooled down before it reached the ground. It reminded us of the species of ore common in Pennsylvania, known among the furnace men as pipe ore, from its resemblance to a bunch of clay tobacco-pipe stems.

YUBA.

BIO OAK FLAT GRAVEL CO.—Gold Hill News, Dec. 27: C. F. Klepper, Supt. of the Big Oak Flat M. Co., in Yuba county, California, is over on a Christmas visit to Virginia City, and reports excellent progress with the works, and favorable prospects of a big fortune ahead for the company at no very distant day. The tunnel now being run to drain the water and reach the rich gold-bearing gravel bed is believed to underlie the surface of the company's ground, is now in a distance of 500 feet, and will yet have about 300 feet to run to penetrate the rim rock and reach the pay gravel. This company is composed of some of the best business men of Virginia City. L. P. Drexler, D. O. Adkinson, E. A. Schultz, Mark Strouse and Wm. A. Rung are the Trustees. D. O. Adkinson is President, Mark Strouse is Vice President, E. A. Schultz is Secretary, and L. P. Drexler, Cashier. The capital stock of the company is \$250,000, divided into 2,500 shares of \$100 each.

Nevada.

WASHOE DISTRICT.

CON VIRGINIA.—Gold Hill News, Jan. 2: Daily yield, 550 tons of ore. The ore stops in the 1550, 1550, 1400 and 1300-ft levels are all yielding their usual quantities of rich ore. Day before yesterday a shipment of 16,688 pounds of bullion, worth \$540,156, was made, being the proceeds of eight days' run of the mills. The mine was never in better working condition or had more favorable prospects than at this time. Work is being pushed forward with steady vigor at every point. On the 1550-ft level the ore stops going south continue to yield rich ore. On the 1750-ft level east crosscut No. 3 has passed through the small vein of rich ore recently found, and drifts both north and south have been started to prospect this vein. The bullion yield is already amply sufficient to insure the payment of the usual monthly dividend of \$2 per share.

CALIFORNIA.—Daily yield, 650 tons of ore. The mills are all running, and turning out the usual amount of bullion. Day before yesterday a shipment of 16,120 pounds of bullion, worth \$558,903, was made, being the largest shipment of bullion ever made at one time from the mine. The ore stops on the 1550, 1550, 1000 and 1650-ft levels all continue their regular yield of rich ores. The yield of bullion already assures the payment of the regular monthly dividend of \$2 per share for the month of December. Everything in connection with the mine is working splendidly, both above and below ground, and there seems as yet nothing but bright prosperity ahead.

SILVER HILL.—Sinking the main incline is being pushed quite rapidly forward. The east drift on the 800-ft level continues in clay, quartz and porphyry mixed, and of a

very lively, ore-bearing look. The flow of water from this drift is considerable, the drift having without doubt drawn the water from the 650-ft level, it having disappeared entirely from that portion of the mine. The development of the mine has never been advanced more vigorously than at this time; if there is a bonanza in that portion of the lode, the present management are going to find it.

MEXICAN.—Sinking the joint Ophir winze below the 1700-ft level is being pushed vigorously ahead to connect with the north drift on the 1000-ft level of the Ophir for air purposes. The winze has 15 or 20 feet yet to go to reach the 1000-ft level.

HALE & NONCROSS.—Owing to the breakage of the Savage pump-hob, nothing has or could be done below the 2000-ft level during the week, the pumps being kept busy to hold the water below that point.

CON. IMPERIAL.—Sinking the joint Alpha winze below the 2135-ft level is making the best of progress. It is now down 160 feet. The south drift from the station at the bottom of the winze on the 2100-ft level is in 24 feet, the face in good working ground.

OVERMAN.—Sinking the deep winze below the 1400-ft level is going vigorously ahead, the bottom in very favorable ground. The south drift on the 1400-ft level is also making good progress, the face in fine quartz.

TRIGAN.—Daily yield, 50 tons, from the slopes and breasts of 350 and 240-ft levels, keeping the Vivian mill steadily running. The ore is not of high grade, but there is plenty of it, and when the indebtedness of the company is paid by the present assessment, the mine will pay its own way.

OMIK.—The completion of the pump and balance bob at the 1900-ft station is being pushed with all the force that can be brought to bear and will be completed in a very short time. The timbers and other machinery are nearly all ready for insertion. The south drift, running east of the main incline on the 1800-ft level, is still advancing, the face in porphyry. This drift is now in a distance of 178 feet. Preparations are being made to sink a winze in the east crosscut from the main shaft, a short distance east of the ore vein. The north drift on the 1800-ft level has reached the Mexican line and a drift has been started west to meet and connect with the joint Mexican winze from the 1700-ft level.

ALFA.—Sinking the main shaft is being pushed vigorously forward to read and open up the 1250-ft level. In the meantime the west drift on the 1150-ft level is being rapidly advanced to cut the ore vein. Sinking the winze in the ore vein below the 1050-ft level has been resumed and is being pushed forward with all possible speed.

JUSTICE.—Sinking the main incline is making best of progress, the bottom in good blasting rock. The shaft will soon have attained a depth sufficient to open another shaft, and will be down at the depth of 1,300 feet. The new ore stops being opened on the 1150-ft level, are showing finely and promise a good yield of pay ore. The Pacific mill will be started up on ore from the mine in a very short time.

SOLID SILVER.—Work was resumed in this mine about a week ago, with Mr. R. Purdy as Superintendent. The main tunnel is being cleared out and retimbered, preparatory to crosscutting at a point where a considerable amount of pay ore exists and which will be stoped out for milling.

BULLION.—Sinking the main incline shaft is going vigorously ahead, the bottom in black dyke of a rather hard, tough character. The distance made during the week was 21 feet. Sinking the winze below the 1340-ft level is making fair progress. A crosscut east has been started on the 2000-ft level, on the south line, between the Bullion and Eschquer ground.

BEST & BELCHER.—Sinking the winze below the 1700-ft level is being pushed vigorously forward to make a connection with the north drift from the 1900-ft level of the Gould & Curry.

YELLOW JACKET.—On the 2200-ft level the east drift toward the new shaft is in 671 feet. The face continues in very hard porphyry, with seams of quartz. The north drift toward the Imperial, at the same level, is in 490 feet, with the face in black dyke. The new shaft is down 1,105 feet. The bottom continues in heavy ground.

JULIA CON.—Sinking the main incline below the 1800-ft level is making good headway, the bottom being very nearly all in lively vein matter. The face of the east drift from the winze on the 1300-ft level is steadily advancing, almost the entire face being in quartz of a fine character.

GOULD & CURRY.—Sinking the main incline is going steadily forward. The west drift on the 1900-ft level running toward the Imperial is being pushed vigorously ahead, and the two will be able to connect in 10 to 12 days more. The repairs to the main shaft above the seventh station are making steady progress.

BELCHER.—The south drift on the 1900-ft level is steadily advancing, the face in favorable ground. The west drift on the same level is also making good progress. The east drift on the 2000-ft level is now in 245 feet.

ALFA.—Sinking the main shaft is going steadily forward, the bottom in fine working ground, and the flow of water giving little or no trouble. The east drift on the 1300-ft level is showing a steady and favorable improvement.

SIERRA NEVADA.—Sinking the deep winze below the 1700-ft level is making excellent progress. Sinking the north winze below the 1250-ft level on the Utah line is also going rapidly forward with encouraging prospects.

SAVAGE.—The water is being held well under control by use of the balling tanks, while every effort is being put forth by the management to get the new V bob in place and ready for use at the very earliest day possible.

UTAH.—The north drift on the 1350-ft level is steadily advancing, the face in vein formation. The south drift on the same level is showing a much softer and more favorable ledge formation. The rock in the face of the north drift on the 1150-ft level continues very hard.

NEW YORK.—Bottom of shaft in good sinking ground, with no increase of water. The shaft is now down about 90 feet below the 800-ft level.

LEVIATHAN.—Good work is being done sinking the incline below the 600-ft level, the ground working favorably and no water interfering. The cable attachment having been completed, the hoisting from the incline is now being done by the main hoisting engine of the surface works.

SOUTH CONCORD.—The face of the main drift east on the 500-ft level is now in soft, fine-grained vein matter, having passed through the hard wall strata into the outcrops of the ore vein.

LADY WASHINGTON.—The main drift south on the 850-ft level continues steadily advancing in low-grade ore toward the Justice mine.

BALTIMORE AND AMERICAN FLAT.—The north drift on the 1400-ft level has been advanced 28 feet during the past week, the face being still in quartz, carrying streaks of ore.

CROWN POINT.—Daily yield, 50 tons of ore, from the old upper levels. The south drift on the 300-ft level is making good progress. The prospecting operations on the 2000-ft level are steadily advancing, without any material change to record.

GEORGETOWN.—The north drift on the 1000-ft level is steadily advancing, the face in very favorable ground. The crosscuts on this level are also showing finely. No changes in either of the drifts on the 1400-ft level.

SUCOR.—The bottom of the shaft is now in vein matter of a highly promising character, being mostly low-grade ore, with occasional streaks that give high assays. The drift at the 900-ft level is also advancing in very favorable indications.

CHOLLAS-POTOSI.—The east drift on the 1735-ft level is steadily advancing and will complete a connection with the west drift from the combination shaft in a very short time. Sinking the combination shaft is going vigorously ahead.

UNION CON.—The north drift on the 1600-ft level is being urged rapidly forward to connect with the Sierra Nevada for air purposes. The connection will probably be completed in 10 days more.

SITRO TUNNEL.—Face of beader in favorable working material, allowing of a good degree of steady advancement. Total length of tunnel, 13,642 feet.

WHITE LEAD.—The face of the tunnel is in material which shows strong indications of the ledge not being far away.

LADY BRYAN.—Preparations being made for the resumption of work on the mine.

BRISTOL DISTRICT.

DAY MINE.—Pioche Record, Dec. 29: Ore continues to be shipped from this mine as rapidly as teams can be had to haul it. The 30-stamp mill started up on Thursday morning, crushing the ore from this mine, of which about 200 tons have already at the mill. A rich body of ore has been struck in the cut running south from the lode, and the mine is now making a splendid showing in regard to ore. The recent work has developed a well defined north and south vein, which has been opened up for a length of 55 feet, both ends being in exceedingly rich ore.

CORNUCOPIA DISTRICT.

MINISO OUTLOOK.—Silver Star, Dec. 29: A correspondent writes that several merchants have sold out or removed their goods to Tuscarora. A vein of good ore, three feet thick, has been developed in the Hussey. The Leopard is being opened on the 600-ft level, and the prospects of striking a good vein are said to be favorable. Water has entered somewhat, but with the development of the mine, but that is now under control. There is said to be enough ore in sight in the Leopard and Hussey to run a 20-stamp mill for two years, at a profit to the companies. The Panther is also looking well and is considered as good as either of the mines mentioned. Some new mines have been discovered in this vicinity recently, but nothing as yet known relative to their value.

ELY DISTRICT.

RAY STATE.—Pioche Record, Dec. 29: Have the house up and have now commenced to straighten up the shaft preparatory to putting on a whim. The work will be pushed ahead as fast as possible.

The shaft is started, and the shaft having been finished, have men to work placing the whim in position, so as to prepare for sinking deeper and hoisting ore.

MAYFLOWER.—The road to the mine being nearly completed, double shifts will be placed to work running the north drifts and sinking through the ledge at right angles for a foot-wall; are hoisting ore and getting the ore-trams ready to transport ore to the 20-stamp mill as soon as repairs to it are completed.

MINERAL HILL DISTRICT.

PROSPEROUS.—Eureka Sentinel, Dec. 29: We yesterday met Mr. Jonathan Walker, of Mineral Hill, who is at present sojourning in Eureka. The Hill is very prosperous, and everybody is busy at work, all with fair success. Those laboring on leased ground are taking out considerable quantities of ore. Capt. Plummer is vigorously prospecting the English company's mine, and has a force of 15 men at work. Indications of the near presence of an ore body have been met with in the Queen's tunnel, and crosscutting will be commenced in a few days. The mill will not be started up until there is sufficient custom and company ore on hand to justify it. Capt. Plummer's management is highly commended, and everybody residing at the Hill is pleased with his administration.

Arizona.

CASTLE DOME.—Arizona Sentinel, Dec. 29: Castle Dome still stands to the front. A number of mining interests up there have been consolidated and taken in hand by the Castle Dome smelting and mining company, a strong corporation, having headquarters in San Francisco. Their works will be on the bay. The difficulty of buying silver ores down here for working with the rich lead ores of Castle Dome, makes it more profitable to smelt at San Francisco. This was always advocated by Wm. F. Miller, and should have been done years ago.

The Moreno mining company gives a fair example of what is yet to be done with mines in Yuma county, which have for years been passed by, probably because they were too accessible and not invested with the fascination of danger from hostile Indians. This company was incorporated October 8th, 1877, having for Directors, W. B. Bie, of Sacramento; Capt. D. Linderman, of Alameda; H. Rosenkrans and R. B. Saffold, of San Francisco; and D. S. Lusk, of Sacramento, now Superintendent. They went to work on a mine over which passes the stage road to Prescott, and which few experts have seen fit to examine. It was too near home and too safe. The surface shows 70 different veins of mineral, carrying gold, silver and lead, all pitching toward the center vein. They run down the hill, some 50 feet high, and crop for the entire length of the claim—1,500 feet. The mine is let for sinking a shaft 100 feet deep. At fifty feet they already have two feet of ore, assaying from hundreds to thousands. Several of the smaller veins are coming in and the mine bears every indication of producing one of the richest ore bodies yet reported in Arizona. None of the men connected with the Moreno company are known as mining sharks or stock thieves. So far everything seems to indicate that the property will be worked honestly and for the best interest of stockholders. The mine itself is most advantageously situated on the main traveled road, about 40 miles from the Colorado river, at Ehrenberg.

CALIFORNIA.—Arizona Enterprise, Dec. 22: Mr. T. M. Luther, who has men at work on the California lode, in Bradshaw mountain, arrived in Prescott a day or two ago. At the time he left the mine, the shaft was down about 60 feet. Said shaft is six feet by four in the clear and the vein has more than filled the shaft. The miners are timbering as they go.

The same gentleman informs us that the Tiger mine, under Mr. Helm's management, is undergoing thorough prospecting. More men have been added to the old working force.

CRICK.—Late news from Humboldt district is of a very satisfactory nature. The Tip-Toe, Coy. Swilling and other mining properties continue to astonish all who see the great quantities of high-grade silver ores that are daily taken out of them. The same may be said of the Peck and sister mines in Peck district.

LOCATER.—N. Rodenburg, of this place, tells us that Henry Muller has just found and located what promises to be a very rich mine, in Humboldt district. Assays of the ore, made by Messrs. Blake & Co., of Prescott, prove it to be rich.

ZALIDA.—Arizona Miner, Dec. 21: The Zalida company has just had 10 tons of ore worked at the Aztlan mill, which yielded 3,300 ounces of crude bullion. The Zalida, we believe, works pretty high in gold as well as silver. We shall try to get the value for publication when it is melted and assayed.

CRICK.—Mr. Wylos has returned from a trip to the Bradshaw mountains and Tiger mining district. Mr. Helm will start for San Francisco about the 1st of January. He has offered \$50 per foot for 100 feet on the north end of the Hammond & Riggs' claim and \$50 per foot for the 200 feet adjoining the original Tiger, known as the Colyer claim.

PECK.—The last of the Peck company's machinery arrived to-day, and will be immediately sent out to the new mill, which, Mr. Bean informs us, will be crushing quartz by New Year's day.

Idaho.

BELLE PECK.—Owyhee Avalanche, Dec. 24: Rumors have been prevailing for the past day or two to the effect that another rich strike has been made in the Belle Peck. All persons interested in mining operations in this vicinity are fervently praying for a big fall of snow. It is neither good sleighing nor good wheeling, in consequence of which there are large quantities of rock at many mines awaiting transportation to the mills.

The Illinois Central is turning out some good ore, a portion of which will be crushed at the Shoemaker arastra in a few days.

Operations at the Golden Chariot are progressing very favorably, and Supt. Denoon entertains strong hopes, as usual, of the existence of a big bonanza in the lower level.

There is no change in the status of the Empire, but as—

Continued on page 12.

The Yellow Jacket New Shaft.

Description of the Shaft and Machinery.

The new shaft of the Yellow Jacket mining company is situated far to the eastward of all other Gold Hill mining works. It is nearly a mile east of the old shaft and works of the company, in the town of Gold Hill, from which it is hidden by several high and rocky hills. The site of the shaft, says the *Virginia Enterprise*, was most carefully and judiciously selected. It is located a sufficient distance to the eastward to bring it in a line with the advanced underground works of the Chollar-Potosi, Hale & Norcross, Savage, Gould & Curry and the Bonanza mines. The shaft is being sunk on a short spur putting out to the eastward from the main range of hills running southward from this city. To the eastward of this spur is a broad and deep gorge, and both north and south are deep ravines, which will furnish dumping room for waste rock for ages. The shaft and works are but a few rods south of the line of the Virginia and Truckee railroad, from which a side track leads to car tracks running to the buildings. Thus it will be seen there is no teaming to be done. Everything required about the works in the way of machinery, stone, timber, lumber and supplies is brought upon the ground by rail.

The Buildings

Over the shaft are large and most substantially constructed of stone and wood. The main building, in which are the hoisting engines and shaft, is 41½ feet in width by 141 feet in length. From the floor, on which stand the hoisting engines and apparatus to the square of the roof, the height is 44 feet. In the large room there is abundant space for all the machinery without the least crowding in any part. The whole interior, beams, roof-timbers, roof and all, have been whitewashed, rendering the room as light as could be desired; indeed, almost as light as out of doors. Underneath this large room is a basement, the walls of which are built of cut stone. In this is also a vast deal of room for machinery and for working purposes. From the floor of the basement to the peak of the roof of the main building the height is 80 feet. From the roof of the main building itself, which is ascended by easy flights of stairs leading up from the outside, a fine view of the surrounding country is obtained. The dump of the Eureka mill, near the railroad track on the Carson river, is plainly to be seen; also the Santiago mill and other places in that direction.

The Boiler Room

Is 52x88 feet in size, and stands on the north side of the main building. In this room there are now three sets of boilers, and two additional sets will be put in when the big pumping engine has been set up. The room is well arranged, and there is ample space in front of the boilers for piling wood and for doing any work necessary to be done by the firemen. A track for a wood car runs from the railroad track to the roof of the boiler room, where it is run upon a cage or elevator and lowered a distance of 35 feet to the floor of the boiler room. It is then run off the cage to a track on the boiler room floor, when it is taken to where wood is wanted and is then unloaded.

The Pumping Room

Is situated to the east of the boiler room, and north of the east end of the main building. It is 53x96 feet in size, and is of about the same height as the main building, with which it forms an L. This room is at present the scene of great activity. The vast foundations for the pumping engine and pumping apparatus are being put in, and the place swarms with stone cutters, stone masons and workmen of all kinds.

The stone used is a feldspathic porphyry, obtained at Nolan's quarry, to the northward of this city. It is very solid and of an exceeding tough nature. More cut stone is being put into the foundations of these works than has ever before been used in any work of the kind on the Comstock lode. Some of the blocks laid and to be laid in the foundations are of immense size and weight. In all, there will be used in this work between 3,000 and 3,500 perches of stone.

It is necessary that the stone should be cut and snugly fitted, as the height of the foundation will be about 35 feet. To bind the whole firmly together and guard against any jar or vibration, a great number of iron rods, of some four inches in diameter, extend upward from the bottom of the foundations, and are built in with the masonry. Holes will be drilled in the cap stones through which these rods will pass, when they will be firmly secured with huge nuts and washers.

The work of constructing the foundations for the pumping engine and pump bob is being most vigorously prosecuted and is fast advancing to completion. There are engaged in the room in which the foundations are being laid, and on the grounds outside of the buildings, some 90 stone-cutters and helpers. So many stone-cutters are at work that the click of their hammers and chisels is almost deafening. The stone work is being done by Daniel Nolan, owner of the quarry at which the stone are procured. Many of the larger blocks are cut at the quarry.

The stone is handled by steam. A donkey engine, the one formerly used in sinking the shaft, which stands in the basement of the main building, brings all the stone into the wing in which the mason work is being done, moves them through the length of the building

on a car, and finally lowers them down upon the exact spot where they are to be used. This saves the workmen a vast deal of hard lifting.

Drilling the Cap Stones.

In a small building standing near the railroad track workmen are engaged in drilling holes through the large blocks of stone which are to top out the foundation walls and found the bed on which will rest the huge plates of the pumping engine and pumping apparatus. The holes, which are four inches in diameter, are bored with a diamond drill which is driven by a small steam engine. The drill penetrates the rock quite rapidly, and the hole is made much smoother and better than could be made by hand. The drill does not cut away the whole of the stone extracted, but brings out a core nearly two inches in diameter. Thus it will be seen that the face of the drill resembles that of a hollow auger. The stem of the drill is hollow, and when it is running a stream of water under a considerable pressure constantly passes down into the rock where the work is being done, bringing up and washing out the chips cut out by the diamonds. This work is progressing well, and all the blocks of stone will be bored by the time the foundations are ready to receive them.

The Shaft

Is one of the finest on the lode. The pump compartment is seven feet six inches by six feet six inches in size, being the largest on the lode. A cage is now running in this part of the shaft, and it will be kept in and kept running, when required, even after the pumping machinery goes into operation, there being plenty of room for it. The hoisting compartments are each five feet by six feet six inches in size. They are most substantially timbered throughout, and the whole shaft is in perfect order.

The shaft had yesterday attained a depth of 1,074 feet. It is now in ground that is somewhat heavy, but which works well, and sinking progresses at the rate of about four feet per day. Very little water is found; in all not more than from 5,000 to 6,000 gallons per day coming into the shaft. Nearly all of this comes up in the "skip," or "skuet," with the dirt.

The "skip" is a sort of heavy iron tank or bucket, square in form, and holding four tons of rock. It is self-dumping, and on reaching the surface turns over so smoothly and neatly that were it filled to the brim with water hardly a drop would be spilled. Having dumped its load, it rights itself and descends the shaft for another load, without being touched by any one. The engineer merely hoists and lowers, as he would do with an ordinary cage. The "skip" is just the thing for use in sinking. It brings up a great load of dirt, and at the same time, with equal safety, will bring up any water that may be in the shaft. The "skip" is a contrivance first used in the Combination shaft in this city, to the eastward of the Savage, Hale & Norcross and Chollar-Potosi mines.

The new Yellow Jacket shaft has been put down very rapidly. The donkey engine was first started up on it November 17th, 1876. With it the shaft was sunk to the depth of 900 feet. The new hoisting machinery, that is now in use, was started up October 10th, 1877. The work of erecting the main building and all the wings, additions and detached buildings, has been done within less than a year.

The Hoisting Engine

At present in use is most compact and powerful. It is of peculiar construction, there being nothing like it anywhere else on the lode, and is well calculated for the work it is now doing. It is sufficiently powerful to sink to the depth of 2,500 feet, but eventually it is expected that it will give way to machinery of still greater capacity. This hoisting apparatus has two steam cylinders 18 inches in diameter by 24-inch stroke. The engine shaft is eight inches in diameter, with a 25-inch pinion. The pitch of the pinion is three and a half inches by 18-inch face. This hoist can be double geared with a pinion 25 inches in diameter on the engine shaft working into a wheel 80 inches in diameter on a 10-inch intermediate shaft; and on the same shaft is a pinion 34 inches in diameter working into a spur wheel 165 inches in diameter. The change of gear is effected by sliding the intermediate shaft in and out by means of a screw and hand wheel on the outer end of the shaft. The object of this gear is for raising pumps and other heavy weights. This is a new arrangement altogether, as a separate engine is generally used for the purpose, and the means adopted in this instance answer for both. The reel shafts are 9 and 12 inches in diameter, respectively, for the reels, of which there are two, 40 inches in diameter by 5-inch face. They can be worked together or separately, with suitable clutches. Each of the spur wheels is furnished with a powerful brake 15 inches in diameter by 6½-inch face, worked by suitable levers connected with a hand-wheel gear.

There is also a brake on each of the engine cranks—another improvement insuring greater safety. These cranks are made six feet in diameter, and are very heavy, forming balance wheels for the engine. Each reel is furnished with the latest improved indicators for telling the depth. The one used is the best one yet devised. On the dial-plate is a spiral thread in which the needle or pointer works, and instead of this pointer having to indicate the depth by one revolution, the use of the spiral gives it three revolutions, thus insuring greater accuracy. In a deep mine where a great deal of cable is out the old way is not accurate enough, but as the depths are plainly

marked on the spiral thread, space enough is given for accurate indicating. The indicators are worked by suitable worm and screw wheels from the reel-shaft. This machinery is all very heavy and finely finished. All the bearings are bushed with brass and fitted with tightening wedges. Each engine is furnished with link-motion reversing gear, patent balance slide valves, etc. The whole apparatus weighs about 90 tons.

The Pumping Engine

Has not yet arrived, though some portions of the machinery connected with it are on the ground. It will probably be completed and on the ground in 30 to 40 days. It will be set up and ready to go into operation within about 60 days after it reaches the works.

It will be a steam jacketed compound condensing engine with two cylinders. The initial cylinder will be 32 inches in diameter, and the condensing cylinders will be 64 inches in diameter with 12-foot stroke each. The cylinders will be placed side by side and the pistons of both will be connected with the same cross-head. The ends of the cross-head will extend beyond the slides on each side, where they will be attached by two connecting rods to two fly-wheels 30 feet in diameter, and weighing 36 tons each.

Owing to the connections between the fly-wheels and cross-head, the pistons will always make their full stroke of 12 feet, and the pumps will therefore never fall short of their full stroke, as they often do with most of the engines now in use along the lode.

The Pump Bob

Will be an immense affair, and will be geared directly to the engine. Except the chord and king post, it will be entirely of wrought and cast iron. The stick of timber for the chord is the largest ever brought to the Comstock or to San Francisco. It came from Oregon, is 38x43 inches square, is 42 feet long, and weighs about 12 tons, as it lies and without irons. The king post is a beautiful stick of timber of proportionate size. The annual rings or growths of the chord stick show it to have been cut from a tree 253 years old.

The rocker shaft of the pump bob is 18 inches in diameter in the bearings. The bearings are solid blocks of brass. From the center of the rocker shaft to the top of the king post, where the attachment with the engine is made, is 21 feet, and the nose end of the bob to the same point it is 17 feet 6 inches, which will give the pump 10 feet of stroke.

The condenser and air pump will be worked with a rocker shaft from the main cross-head. This cross-head will be a huge piece of iron some three feet in diameter.

The pump column will have an inside diameter of 14 inches, and the pump rod will be 16x16 inches, and each stick will be 60 feet in length. Taken all in all this will be the most complete and powerful pumping machinery ever seen on the Comstock lode. It is expected that it will be set up and ready to go into operation by the time there is any work for it to do.

Various Matters.

Thus far the shaft may be said to be dry, as the water coming in amounts to nothing, and is nearly all hoisted out with the dirt. Not only is the shaft dry, but the drift coming toward it, at the great depth of 2,300 feet, is also dry. This drift is now distant from the shaft but 250 feet. In eight weeks more it will be under the shaft.

This being the case, and no water yet being found, it is not likely that the heavy pumping machinery will be required until the shaft shall have attained a depth considerably exceeding 2,300 feet.

No drifting will be done and no station opened until the shaft has reached the depth of 2,300 feet—until it has been connected with the drift. Once the drift has reached a point under the shaft, work on the latter can be commenced most advantageously, as upraise excavation is always much more expeditiously performed than that which is done by sinking.

The gallow's frame is one of the heaviest and most substantial on the lode. It is an immense mass of huge square timbers strongly framed and bolted together. It is also of great height, and when it shall become necessary to put in more powerful hoisting machinery it can be set up in a building placed at the west end of the main building where the hoisting cables will pass high above all the machinery now in operation.

At the top of the main building, on a heavy platform of timbers, are two great iron pulleys, for use in lowering the pumps and pumping machinery into the shaft. The larger of these wheels weighs 9,500 pounds. The smaller wheel, though lighter than its mate, is built to sustain a much greater weight. The blocks and tackle to be used in connection with these pulleys are proportionately strong and heavy.

A large water tank on a high hill to the westward of the works affords ample protection against fire. There are several hydrants in and about the works, with easy flights of steps leading from the ground to tops and over the roofs of the several buildings, but in addition, Superintendent Taylor contemplates the erection of a hydrant on the roof of the main building.

Besides the buildings and wings already mentioned, there is a commodious carpenter shop, blacksmith shop, and all the various shops and outbuildings usually found about works of the kind.

A short distance to the north of the works, just across the railroad track, quite a little vil-

lage is springing up. It already contains ten neat and substantial dwellings.

In conclusion, we may say that the new shaft of the Yellow Jacket company is most favorably situated, it being in the true course of the Comstock, as shown by the deep workings to the eastward in the Savage, Hale & Norcross, Gould & Curry and other mines lying immediately to the northward. The surface indications are excellent. The shaft is being sunk in vein matter, and at a short distance to the eastward, across a gorge, rises a huge mountain of the same material, so strongly marked in color that it may be distinguished at the distance of 15 or 20 miles—as far as the eye can see, for that matter. The Yellow Jacket, in this, its new departure, will presently give a good account of itself, and to see it one need not live long.

Agricultural Investigations at the University.

We have been interested and gratified by the perusal of a pamphlet recently issued from the State printing office at Sacramento, and which contains the reports made to the President of the University from the Colleges of Agriculture and the Mechanic Arts. The chief portion of the pamphlet is occupied with Prof. Hilgard's report, and gives at length the views of this able and indefatigable worker concerning the best methods of promoting the interests committed to his charge. We do not propose at this time to follow the Professor in his well fortified argument on the needs and practical value of a fuller and systematic knowledge of the conditions affecting the practice of agriculture in this State and a better understanding of the capabilities of our soils, or of the advantage it would be to the State to strengthen his hands by securing the aid of specialists in carrying on the work, which is evidently too great for one man to prosecute. These things are important, and will, ultimately, be secured; nor do we underrate them by giving them but an allusion in this place. We wish rather, with the space now at command, to indicate briefly some of the items of the actual work which has been accomplished in Prof. Hilgard's department, as shown by the copious appendices in his report.

Results are given of two years' careful experiments with different cultures of the "hill adobe," which comprises the experimental plat at the University. These results are carefully tabulated, and occupy about ten pages of the report. Although the experiments were considerably interfered with by the excessive drouth of last season, Professor Hilgard discerns results which would lead to the following conclusions concerning the improvement of the upland adobe of the Coast range, which has been weakened by years of cropping. The use of potash manure and of plaster seems to have exerted no influence whatever upon the product either as to straw or grain. The effect of ammoniacal manure is doubtful, and such manures do not seem likely to pay in view of their high cost. The beneficial influence of large dressings of lime seems hardly questionable. It is well known that dressings of lime counteract the tendency to growth of straw, and favor the yield of grain. The culture experiments at the University indicate that the use of 600 to 1,000 pounds of lime per acre will doubtless be followed by a material improvement in productiveness, and doubtless in tillability. There were also results showing that the application of phosphates (whether as superphosphate or bone meal) increased the product.

Prof. Hilgard makes this farther reference to the use of lime on black adobe soils: "The fact that black adobe soil contains over one per cent. of lime, (which is four times the amount usually deemed sufficient for the adequate supply of plant food in good soils), of course shows that the addition of any small amount of lime, as manure, would be useless, but it is nevertheless true that the tillability of the soil may be greatly improved by such addition of lime as can be afforded, in cultivation on a small scale, as in truck gardens, orchards, flower gardens, lawns, etc."

In the important problem of rendering alkali soils productive, Prof. Hilgard's report shows that he has begun investigations which we hope will be continued until the varied nature of our alkali lands may be met with proper remedies. Those interested in these soils should by all means read the full statements and analyses which are given in the report, and aid the Professor farther by sending specimens of their "alkali" soils, according to the instructions given. Prof. Hilgard has already demonstrated his title to honor as a successful doctor for alkali, for in one of the southern counties, where he prescribed gypsum (plaster) for the particular form of alkali presented to him, the farmers applied the remedy with gratifying success, and have recently found a bed of gypsum near at hand with which they can conquer these infertile spaces. It is a victory for science and practice combined which we rejoice to record.

Under the head of analysis of commercial manures, the report gives an analysis of "Ward's Superphosphate," which was brought in this market for examination. It was sold at the rate of \$50 per ton. The caution to farmers against this material is plain in the following quotation from the report: "The ap-
..... 17 @ 18

shows that this is one of the many low grade superphosphate manures, which, in the absence of State supervision of this very tricky class of merchandise, still allows a place in the general market. That it should be thought feasible as a business transaction, to ship such an article to the other side of the continent from the point where it was compounded, shows the unbounded confidence of the manufacturer in the helplessness of the prospective consumers. The valuation (\$33.10 per ton), which is shown by the analysis, low as it is as compared with the price asked, is still too high, because some of the articles credited in the analysis are of no value at all to the farmer. In fact, \$25 per ton would be a high price to pay for the article."

Prof. Hilgard also gives an account of the manufacture of phosphate manures as practiced by Messrs. Ohlandt & Co., Petrolero, S. F. The material obtained at this establishment was found of excellent quality and strictly pure. So small is the appreciation of phosphate manures on this coast, that the above firm ship their products mainly to Australia and New Zealand. On this movement of fertilizing material away from our fields, the Professor says: "It can hardly be questioned that the hauling of common stable manure from the city stables to the truck gardens outside of the city, very frequently renders that manure much more expensive than would be an amount of high grade superphosphate producing a similar commercial result. It cannot be long before this will be understood, and the shipping of our phosphates to Australia replaced by sales in the home market. I cannot help thinking that if a first-class fertilizer of this kind, sold by assay of actual value as are other products, were to be had in the San Francisco market, it would soon come into use, and that a most profitable industry would be thus speedily created. Wherever crops producing a high value per acre (such as the fruits of California), are prominent in culture, the production of the use of concentrated commercial fertilizers to increase and improve the products, cannot be long delayed."

Other items in the appendix to the report relate to analyses of sugar beets and other articles which have been already summarized in Prof. Hilgard's communications to the *RURAL PRESS*. His report is, as we have said, a State document, and should be read by all farmers. Copies will be sent, we presume, to all who may request them from their representatives in the Legislature at Sacramento.

Drying Slimes and Tailings.

The new tailing dryer, which, says the *News*, is being constructed at the Gold Hill foundry, for the Railroad mill, in Six-Mile canyon, consists of three revolving cylinders, arranged parallel with each other in a furnace, so constructed as to secure the greatest available heating surface.

Through the center of each cylinder a shaft containing spiral arms is made to revolve in the same direction as the shaft of the cylinder. The arms, being set spirally, act very similarly to the screw in a conveyor, so that any material put in at one end of the cylinder will be conveyed through to the other end at a velocity proportionate to the pitch of the arms and number of revolutions.

The cylinder will run from left to right at the rate of about 10 revolutions per minute, the arms or blades running about 40 revolutions per minute. By revolving the cylinder a uniform heat is maintained over its entire surface. The cylinders are three feet in diameter and about five and a half feet in length. It is estimated from experiments already made that about 50 tons of wet slimes can be passed through each of the cylinders and thoroughly dried every 24 hours.

Mr. Kimble, the inventor, a practical mechanic, has given his attention for several years to the drying business, and in the East to drying grain and preventing its heating in large elevators.

OLIVE OIL IN SPAIN.—The British Vice Consul at Malaga gives the following reason why Spanish olive oil ranks low in the market: Very large tracts are dedicated to the cultivation of the olive tree. Its produce is a source of material wealth to Spain, and constitutes one of her principal exports. This item alone, however, serves to demonstrate the degree of indifference and short sightedness of the Spanish cultivator. Whilst the oil which his trees yield, when properly treated, bears advantageous comparison with the best Lucera or Florence oils, he is contented to see it quoted in foreign markets at the bottom of the list, and at the lowest rates, condemned and sneered at as green and rank; whilst a little energy, aided by the fine machinery used in other countries, might raise its character and price to its proper position, to say nothing of its improvement for home consumption, which is so large—although, perhaps, such improvement would not suit the taste of the Spaniards, who, as a rule, might deem it tame and insipid were it deprived of the sting and smack which so invariably accompany it. The olives are gathered carelessly. They are beaten off the trees whilst yet green, and heaped up in yards, where they are allowed to heat and ferment for months, so that when they are ground and pressed they more resemble masses of manure than any other substance. Then the application of scalding water to the paste whilst pressing assists in the extracting of all the foul and putrid essences.

USEFUL INFORMATION.

Glue and Its Preparation.

A good article of glue is one of the most important articles in the whole round of wood workers' materials. This subject was lately fully discussed in *The Hub*, and therefrom we draw points of leading importance. In the selection of glue, the testing of it, so as to form some estimate of its adhesive qualities, is a matter of first importance. All glue in the cake is subject to be influenced by the moistness or dryness of the atmosphere, becoming soft in damp weather and crisp in dry weather, but different kinds are differently affected and hence it is better to purchase in dry weather, as that which is then soft is not of as good quality as that which is crisp, and it should be borne in mind also, when purchasing, that the most transparent is generally the best. It is always advisable, before purchasing, to submit to experiment a sample of the article offered. To do this, take a cake of glue, place it in a pan and cover it with water, when, after some hours, if it be good glue, it will swell but not dissolve, while, if bad, it will partly if not wholly dissolve in the water. Another test is this: After being dissolved by means of heat, that glue is best which seems most cohesive or which is capable of being drawn out into thin filaments or strings and does not drop from the brush or glue stick as water or oil would, but rather extends itself in threads as it falls from the brush or stick, and if the glue possesses the requisite properties, this will always be found to be the case.

The preparation of glue is very simple. It is first broken up in small particles and put in a vessel, covered with cold water and left to soak for a number of hours, the length of time required for soaking being generally governed by the strength of the glue, the strongest glue taking the longest time. After being soaked until it all swells and becomes soft and gelatinous (avoid oversoaking), it is then placed upon the fire to cook, being kept stirred until it is thoroughly dissolved and appears stringy, as we stated above. It is then ready for use; but in factories where a large quantity is employed, it is then poured out in a large flat pan and left to cool, and the workman, when desiring it for use, cuts off the required quantity and heats it. I would remark here that it is a bad habit for workmen to allow the glue pot to remain on the stove after they are done using it, as a very prolonged heat will destroy the adhesive qualities of the glue.

As a novelty in the way of preparing glue, the pulverized article has recently been introduced to the trade. It seems that the pulverized glue is recommended for its convenience, being more quickly prepared for use than that which is in cakes, the latter requiring several hours to soak, whereas the pulverized can be soaked just as thoroughly in a few minutes; and this is a great advantage, particularly in warm weather, when glue put to soak is often liable to spoil. Again, if a workman's cooked glue runs out, he can in a short time prepare more from the pulverized, and this is often a great convenience, as every workman knows, especially when quitting time is near at hand.

Always use the glue hot and if possible warm the pieces of wood to be joined together. If the wood is cold, it will so chill the glue that a good and permanent joint is impossible. After the glue is applied, the woods, if the shape allows, should be tightly clamped together and left for several hours till thoroughly dry. A cabinet maker's two-inch or three-inch malleable clamp, or larger wooden clamps, are very useful for this purpose. There are many articles the amateur will make, such as light brackets, card baskets, etc., the various parts of which cannot be clamped together. They can, however, be bound together by means of cords, with wedges inserted to tighten the cords, and after the glue has set, strengthened with fine screws. Use the glue rather thin, apply it with a brush and avoid getting on too much.

We will add two further suggestions in this connection, namely, in applying glue, where the part is end grain, first fill the pores of the wood with thin glue and let dry, then clean off and glue at the joint with strong glue. Many a job has been spoiled by reason of neglecting to fill the end grain in this manner. Next, in adding water to glue, it is best to give the glue a boil before using again, so that it may be evenly and thoroughly mixed.

PETROLEUM IN FRANCE.—The French government is very shrewd in its action regarding the shipment of petroleum to its shores. In order to encourage domestic manufacture, a heavy import tax was levied some time ago upon refined oil, while the crude petroleum is permitted to pass into the country free of duty. In consequence, oil refineries have sprung up through the whole of France, and the export of crude petroleum to that country has increased wonderfully during the past six months. Three years ago the shipments to Antwerp were greater than to any foreign port, but at present the French have largely the advantage in the raw product, and the orders for this fall and the coming winter manufacture in that country are of extraordinary quantities. Spain, Portugal and Italy are purchasing largely of the

French refined article, which is said to cost them less than the American refined oil. The expenses of labor are less and French chemists claim to have discovered cheap modes of deodorizing and purifying the oil unknown to our refiners. It may soon become a serious question to the large refiners in this country whether the increasing shipments of French refined petroleum to the southern countries of Europe will not largely reduce the demand for their manufactures and materially affect their business. They should—and we doubt not they will—avail themselves of all the new discoveries for improving the character of the oil and lessening the expense. We understand that one has already in use a new mode of condensing the vapors, dispensing with the old-fashioned worm, and that the oil has been improved at a diminished cost.

To Silver Glass.

Prepare two solutions, says the *Jeweler and Silversmith*: 1. Argentic nitrate is dissolved in distilled water and ammonia added to the solution, till the precipitate first thrown down is almost entirely redissolved. The solution is filtered and diluted so that 100 cc. contains one gramme of argentic nitrate. 2. Two grammes of argentic nitrate are dissolved in a little distilled water and poured into a liter of boiling distilled water; 1.66 grammes of Rochelle salt is added and the mixture boiled for a short time, till the precipitate contained in it becomes gray; it is then filtered hot.

The glass having been thoroughly cleaned with (1) nitric acid, (2) water, (3) caustic potash, (4) water, (5) alcohol, and lastly, distilled water, is to be placed in a clean glass or porcelain vessel, the side to be silvered being placed uppermost. Equal quantities of the two solutions are then to be mixed and poured in, so as to cover the glass. This should be done while the glass is still wet with distilled water. In about an hour the silvering will be completed. Then pour off the exhausted liquid, carefully remove the glass, wash in clean water, rub off silver deposited where not required, allow to dry and varnish silver side with any thin varnish which does not contract much in drying. The time required for the operation depends on the temperature. If the solution be warmed to about 30° C., the silver is deposited in a few minutes, but it is safer to use them cold. The insides of test-tubes, bulbs, etc., are silvered by putting the solutions into them, no second vessel being then required. Throughout the whole operation the most scrupulous cleanliness is the grand essential.

CLEANING COPPER.—The removal of tin from copper vessels coated therewith, can easily be accomplished, according to Prof. Bottger, by immersing the vessel in a concentrated solution of sesqui-chloride of lime. In a very few moments the tin is removed from the copper, and nothing remains to be done but scour the latter with moistened sand and dilute hydrochloric acid to obtain a perfectly clean surface.

GOOD HEALTH.

A Food for Infants.

Suitable food for infants which are deprived of their natural pabulum is an important matter and has received the attention of the most eminent physicians. The German chemist Liebig devised a soup or pap for this purpose, being led to the task from the fact that one of his grandchildren could not be nursed by its mother. The following is Liebig's recipe and his description of the ingredients employed:

Half an ounce of wheat meal, half an ounce of malt flour, and seven and a half grains of bicarbonate of potash, are weighed, mixed first with one another, and afterwards with an ounce of water, and lastly with five ounces of milk. The mixture is then heated with constant stirring, over a very gentle fire, until it begins to grow thickish; the vessels are now removed from the fire, and its contents are stirred for five minutes; these are then heated once more and again removed, when a new thickening occurs; lastly, the whole is brought to a boil. After the separation of the bran from the milk through a fine sieve the soup is ready for use.

Wheaten Meal.—For this ordinary weal meal is chosen, not the finest or the first shot meal, which is richer in starch than the whole meal.

Malt.—Barley meal can easily be procured from any brewer. In Germany, or rather in Munich, the malt is so much dried that the starch of many grains appears to be half-roasted. This malt employed in making the soup gives to the latter a taste of bread, which is not unpleasant; usually the malt contains an admixture of many seeds of weeds, which must be picked out with the hand. An ordinary coffee-mill answers for preparing the malt flour, the latter must likewise be separated by means of a hair sieve, not too fine, from the chaff. Malt prepared from barley is to be preferred to that from oats, wheat, or rye.

Carbonate of Potash.—For the preparation of the solution the ordinary alkali salt, carbonas depurata of the pharmacists, answers very well; two ounces of the salt are dissolved in 16 of water. If spring water be used, there is generally a precipitate of some carbonate of lime;

after an hour the fluid becomes quite clear and bright. The carbonate of potash must not be greasy or damp. The bicarbonate of potash is the ordinary crystallized salt.

In order to avoid the rather troublesome weighing of the flour, we may observe that a heaped tablespoonful of wheat meal weighs nearly half an ounce; a heaped tablespoonful of malt flour, wiped off at one-half with a card, likewise weighs half an ounce. For measuring the solution of potash an ordinary thimble answers; this when filled holds nearly three grammes (45 grains, 2.8 cubic centimeters) of solution of potash.

For the milk and the water two ounces are weighed in an ordinary tumbler, then five ounces of water, and the heights at which both quantities of fluid stand are marked on the outside of the glass by attaching pieces of paper.

When the soup is prepared it is sweet as milk, and the further addition of sugar is unnecessary; it possessed double the concentration of woman's milk, and can, which is not unimportant for sucklings, be given in the nursing bottle. If it has been heated to the boiling point, it keeps good for 24 hours; if this has not been done it turns sour and coagulates like milk; if the addition of potash be neglected, it cannot, in general, be heated to the boiling point without coagulating. In the absence of the potash the soup is difficult of digestion like ordinary milk-pap.

POISON IN ENAMELED CLOTH.—It seems that the shiny covering of our baby wagons is sometimes a means of lead poisoning. The *Journal of Materia Medica* says: In Germany, where this enameled or "leather-cloth" is largely used, this suspicion has been confirmed by the occurrence of numerous cases of sickness among children who have been carried about in children's wagons which are covered with this cloth. The symptoms were invariably those of lead poisoning. An investigation was recently undertaken at the instance of the Imperial health office, and the different specimens of the cloth, both of German and foreign make, the enormous quantity of 45.7 per cent. of metallic lead was found; from a piece of cloth weighing 10 grammes, a mass of lead weighing 4.25 grammes could be obtained. The cloth burned readily, and drops of lead reduced to the metallic form could be seen running off, even when only a small piece of it was ignited. When exposed to direct sun-light, the varnish cracked and began to peel off. The board of health, consequently, earnestly warns the public to be aware of this wagon-covering, "in the sanitary interest of the children."

YERBA SANTA.—We notice by the last issue of the *Physician and Pharmacist* that the California shrub yerba santa (*Eriodogon Californicum*), is coming into high favor as a remedy for lung diseases. An essay on the subject by Dr. C. G. Polk, late Professor in the Pennsylvania College of Pharmacy, after giving detailed accounts of cases in which the remedy was employed by him, concludes as follows: "The yerba, by its splendid blending of tonic, astringent, balsamic and alterative powers, arrested the ulcerative processes in the lungs."

From the above cases it would seem that the yerba santa, as yet, has no equal in the management of chronic catarrhal diseases, exerting a peculiarly salutary influence upon the lungs, bronchi, or hemorrhoids. I would expect most excellent results in dyspepsia, and in both chronic diarrhoea and chronic dysentery."

NITRATE OF LEAD AS A DEODORIZER.—A correspondent of the London *Lancet* recommends nitrate of lead as a most effective deodorizer. Bad smells, he says, from whatever cause they may arise, are removed as if by magic by its use; it is also remarkably inexpensive, a pound of the material costing less than a shilling, and in combination with common salt, furnishing sufficient to make nearly 400 gallons of the fluid. To prepare it for use, it is simply necessary to take, for ordinary purposes, half a dram of nitrate of lead, dissolve it in a pint or more of boiling water, dissolve about two drams of common salt in a pail of water, pour the two solutions together and allow the sediment to settle. All that is required in order to immediately purify and sweeten a fetid atmosphere, however originated, is to dip a cloth in the liquid and hang it up in the apartment.

WARTS.—If they give you no special inconvenience, says *Hall's Journal*, let them alone. But if it is of essential importance to get rid of them, purchase half an ounce of muriatic acid, put it in a broad-bottomed vial, so that it will not easily turn over; take a stick as large as the end of a knitting-needle, dip it into the acid, and touch the top of the wart with whatever of the acid adheres to the stick; then, with the end of the stick, rub the acid into the top of the wart, without allowing the acid to touch the well skin. Do this night and morning, and a safe, painless and effectual cure is the result.

SKIN DISEASES.—We read in our medical exchanges reviews of a new elementary treatise on diseases of the skin for the uses of students and practitioners, by Henry G. Piffard, A. M., M. D., Professor of Dermatology, University of the City of New York, etc. We have long known Prof. Piffard as a most patient, diligent and thoroughly scientific investigator in this important specialty of medical work, and we are assured that his treatise will take high rank, and be of wide usefulness.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—The Improved Car Starter; The Wood Boring Shrimp; Double Seal Valve Trap, 1. The Week; A New Volume; The Bullion Product of 1877; Production of Coin, 8. The Exchange Mining Co.; Free Reading Rooms; From the Boise County; The Sierra Plums and Lumber Company, 9. Notices of Recent Patents; Patents and Inventions, 12.
ILLUSTRATIONS.—Pritchard's Improved Car Starter; Enlarged Limboria, 1. The "Clampion" Mill of the Sierra Plums and Lumber Company, 9.
CORRESPONDENCE.—Report of the Entomological Commission; The River Beds in Montana, 2.
MECHANICAL PROGRESS.—The Indian Prize for a Rattle Machine; How an Axe is Made; Drilling for Prizes in Colorado; Illuminated Numbers; New Sewing Machine Motor; Removing a Wreck with Hercules Powder; Initiation of Marble; Bronzing Cast Iron, 3.
SCIENTIFIC PROGRESS.—A Prescription for Phylloxera; Testing the Influence of Forests; Influence of Pressure on Combustion; Canadian Entomology; Telephone and Deafness; Transparency of Iron Heated to Redness; Engraved Glass; Exploration in the Indian Seas; Aerial Telegraphy; The Lick Telescopes; Straightening Tools, 3.
MINING STOCK MARKET.—Sales at the San Francisco, Pacific and California Stock Boards. Notices of Assessments, Meetings and Dividends, 4.
MINING SUMMARY from the various counties of California, Nevada, Arizona, Idaho, Montana, Oregon and Utah, 5-12.
USEFUL INFORMATION.—Glue and Its Preparation; Petroleum in France; To Silver Glass; Cleaning Copper, 7.
GOOD HEALTH.—A Food for Infants; Poison in Stomached Cuts; Yuba Salts; Nitrate of Lead as a Deodorizer; Warts; Skin Diseases, 7.
MISCELLANEOUS.—The Ice Works; Aurora District; Cane and Car Improvements, 2. The Yellow Jacket New Shaft; Agricultural Investigations at the University, 6-7. Drying Slimes and Tailings; Olive Oil in Spain, 7. Pocket Mining; A Question of State, 10.
NEWS IN BRIEF on 12 and other pages.

NEW ADVERTISEMENTS.
Dividend Notice—Oerman Savings and Loan Society; The Victor Rock Drill, W. Weaver, Phoenixville, Penna.; Position Wanted, address B. S., this office.

The Week.

The week has brought the opening of the new year, and with it a temperature quite unusual in this halmy clime. The frosty mornings of the past few days seem a slice of Eastern winter weather, for we have seen ice half an inch thick forming in the troughs and buckets of water, a sight seldom seen in this neighborhood. The mantle of brilliant frost which has covered everything in the early day of late has had the effect of bringing out thick overcoats and gloves and has wrought havoc with the tender plants in many of our gardens. All this time the skies are bright and clear, and the sunshine warm in the middle of the day. With the week also comes a new volume of the PRESS, a fact of which our readers will no doubt take note, and we hope a result will be a general renewal of subscriptions and the advent of a number of new names. Although the farmers and miners are still in want of more rain, for present purposes considerable has fallen. We can only hope for more abundant pluvial blessings this month to make glad the hearts of all men. With even an ordinary rainy season, such ample time have our miners had for preparation, that they ought to be prosperous this year. With an abundant snow supply in the mountains this winter, the spring will bring a harvest of gold such as we have not seen for several years.

A New Volume.

This number of the MINING AND SCIENTIFIC PRESS is the first of volume XXXVI, and we hope that our readers of last year will continue with us through this one. We have aimed to continually improve the Press from year to year, and do not intend to cease our efforts in this direction now. The fact that times are hard is no excuse for any milder or mechanic to cease reading his home paper. People progress in both good and bad times, and because husiness is somewhat dull now it is no reason that it will always remain so. We look forward to renewed prosperity among our miners and manufacturers this year, and believe that the depression of last year will have more of a salutary influence than otherwise. People will speculate less and look more favorably on legitimate enterprises. This will be better for real miners, and have the effect of giving employment in industrial pursuits to more working men.

It is but proper to suggest at the opening of the year that this is a good time for new subscribers to send in their names and for old ones to renew their subscriptions. The readers and publishers of a newspaper have mutual interests which cannot be dissolved without injury to both. The publishers cannot do without subscribers any more than the readers without a paper. The individual contributions of each miner and mechanic goes to swell the amount necessary to carry on a technical journal of this kind. It is their duty to assist us with the "sinews of war," as it is ours to uphold their interests and furnish mental food for them. One cannot do without the other. It makes rather a distressing picture to imagine what would become of the newspapers without subscribers, but it is still a more distressing one to think of the people without newspapers. No one would get the experience of others at home and in different parts of the world, and the wheels of progress would be blocked entirely. Perhaps if readers would turn their thoughts in this direction occasionally they would appreciate the efforts of publishers better, and attend to their part of the moral duty more promptly. They would see that no one could run a newspaper without money, and would contribute their share with willingness, and without even being asked for it. When this feeling once began to take possession of them half the worry and work of editors and publishers would cease, and their tasks be more congenial and pleasant.

Now although we have a good many subscribers, we have room for a good many more, and by widening our field of usefulness can benefit others as well as ourselves. It takes considerable money to conduct a paper of the character of the PRESS, and we would be rejoiced to see our lists twice as long as they are. This can be accomplished easily by the help of our friends, among whom are all our present subscribers and advertisers. A word aptly spoken is often equal to a subscription, a hint which we hope our readers will hear in mind.

And now that we are fairly started in on another year's work, it shall be our aim as it has been before, to improve the PRESS in every particular and continue to make it useful to the miner, mechanic, manufacturer, lover of popular science and industrial readers everywhere.

THE OAKLAND MECHANICS' INSTITUTE.—A practical move is on foot in Oakland to establish a mechanics' institute there which is to be a real school of technology. Col. John Scott, a liberal-hearted citizen of that town has come forward with an extremely liberal donation to start it in the shape of a site for the buildings. A considerable sum is required for the purpose and a number of gentlemen are now devising ways and means. We shall shortly give an engraving of the proposed building and such details of the plan as have been arranged. It is to be hoped that the project will receive the attention it warrants from all good citizens.

METEOROLOGICAL SUMMARY FOR DECEMBER.—The report of the U. S. Signal Service officer, of San Francisco, for the month of December is summarized as follows: The mean height of barometer for the month was 30.04; mean temperature, 52.6°; mean humidity, 73°; prevailing winds, north; highest barometer, 30.338; lowest, 29.674; highest temperature, 64°; lowest, 42°; monthly range, 22°; greatest velocity of wind, 20 miles per hour; total number of miles traveled by wind, 4,058; total rainfall, 2.66 of an inch. Rainfall in December during former years: 1871, 14.36 inches; 1872, 5.95 inches; 1873, 9.72 inches; 1874, 0.33 of an inch; 1875, 4.15 inches; 1876, 0.00 inches.

The firm of Spaulding & Barto, printers, for many years in the same building as our editorial and composing rooms, No. 414 Clay street, have admitted to partnership, Mr. Solon H. Williams, and now style themselves Spaulding, Barto & Co.

The French Academy of Naval Sciences has elected Ralph Waldo Emerson one of its foreign associates.

The Bullion Product of 1877.

Through the kindness of Mr. Valentine, General Superintendent of Wells, Fargo & Co.'s Express, we have received the following circular relative to the bullion yield of this coast for the year 1877:

EDITORS PRESS:—The following is a copy of our annual statement of precious metals produced in the States and Territories west of the Missouri river, including British Columbia and the west coast of Mexico, during 1877, which shows an aggregate yield of \$98,421,754, being an excess of \$7,546,581 over 1876, the greatest previous annual yield in the history of the country. Arizona, Colorado, Idaho, Nevada, New Mexico, Oregon, Utah and Washington increase; British Columbia, California, Mexico and Montana decrease; but it is possible the falling off in Montana is more apparent than real. In our statement for 1876, Dakota (Black Hills) was not mentioned. It appears herein credited with \$1,500,000 gold, but the estimate is uncertain, as \$950,000 is the total amount carried out by all express companies and mail. The amount named as carried by other conveyances is conjecture. If the Comstock mines yield as much in 1878 as during the past year, the aggregate product of silver and gold will approximate \$100,000,000.

Statement of the Amount of Precious Metals Produced in the States and Territories West of the Missouri River, During the Year 1877.

States and Territories	Gold dust and bullion by express.	Gold dust and bullion by other conveyances.	Silver bullion by express.	Silver bullion by other conveyances.	Total.
California.....	\$14,512,123	\$725,606	\$1,391,751	\$1,734,226	\$18,114,716
Nevada.....	492,660	108,600	44,320,044	61,580,000	62,120,264
Washington.....	993,831	88,834	92,202	92,202	1,101,197
Oregon.....	83,842	9,820	1,892,400	1,892,400	1,976,220
Utah.....	1,400,000	171,601	3,120,000	2,664,412	5,255,013
Montana.....	1,540,000	91,000	1,480,000	6,120,000	9,241,000
Idaho.....	91,000	9,110	1,197,801	1,664,411	2,962,312
Colorado.....	3,161,277	1,169	273,840	370,430	3,536,296
New Mexico.....	1,169	122,857	506,549	1,750,206	2,380,671
Arizona.....	590,000	72,144	1,600,000	1,450,000	3,762,144
Dakota.....	72,144	11,003	1,020,686	340,212	1,493,045
British Columbia.....	1,106,027	11,003	1,020,686	340,212	2,477,928
Total.....	\$34,671,400	\$1,853,381	\$32,000,214	\$19,291,209	\$86,816,204

We have used the utmost care and diligence in ascertaining the character of bullion and ores reported, with the following result. The yield of the Comstock mines is 45% gold; of the whole bullion product of Nevada, 37% is gold; and of all so-called silver or base bullion, 28% is gold. The gross yield for 1877, shown above, segregated, is, in round numbers, as follows:

Lead, 5%.....	\$5,085,250
Silver, 45%.....	47,206,957
Gold, 47%.....	46,129,547

As lead is an important element in what is herein termed base bullion, we might add that of Missouri and Illinois, value approximately \$1,500,000; which, with the silver and gold of the Lake Superior country, Virginia and North and South Carolina, amount say \$500,000, would swell the gross product to over \$100,000,000 for the year. The lead product of Utah, Nevada and California, exceeds that of the remainder of the United States and Territories combined; and in tonnage is greater this year than ever before, though not exceeding in value that of 1876, the average price having been lower than for many years past.

In our statement of 1876, the amounts credited to British Columbia and west coast of Mexico, were inadvertently carried into the totals credited to the United States, in the estimates given on the right-hand page of the statement. Deducting amounts from the sources named, the results are as follows:

The net product of the United States and Territories west of the Missouri river, divided as follows:

Year.	Products of the U. S. & Territories west of the Missouri river, including Alaska and Mexico.	Products of British Columbia and Mexico.	Lead.	Silver.	Gold.
1870.....	\$54,000,000	\$32,151,000	\$1,080,000	\$17,320,000	\$33,750,000
1871.....	55,240,000	35,740,000	2,100,000	19,285,000	34,330,000
1872.....	62,238,353	40,331,324	2,250,000	19,524,424	38,109,385
1873.....	72,358,693	70,139,354	3,450,000	27,433,812	39,206,558
1874.....	71,401,015	71,935,611	3,800,000	29,639,122	38,464,438
1875.....	80,889,057	76,703,452	5,110,000	31,655,239	39,948,194
1876.....	90,875,173	87,219,355	5,040,000	32,222,221	42,550,735
1877.....	98,421,754	95,811,581	5,085,250	45,846,109	44,830,233

We are uninform as to the actual exports of silver to India, China and the Straits previous to 1851, but assume that they were less than

since that date, which being so, the exports this year are the greatest known, viz.: \$105,000,000 to the 26th inst. The greatest amount in former years was \$83,650,000, in 1857. The amounts exported during the present year were approximately as follows: From Southampton, \$80,000,000; from San Francisco, \$19,000,000; from Marseilles, \$4,000,000; from Venice, \$2,000,000.

We take pleasure in acknowledging the prompt responses of persons applied to for information, and to whose cordial co-operation we are indebted for much of the data necessary to our compilations.
JNO. J. VALENTINE,
General Superintendent.

Production of Coin.

The operations of the Mint in this city for the past year have been unprecedented in the records of coinage in any similar institution in the world. The total value of the coinage of the year is \$49,772,000 in 28,025,100 pieces, as shown by the table given below. The San Francisco Mint is now the most important in the United States, as it coins so much of the original product of the mines. The bullion product of the Pacific coast States and Territories for the past year, according to figures given by Wells, Fargo & Co's agent in another column was \$98,421,754. Of this the San Francisco Mint has coined nearly \$50,000,000. A great deal of the bullion has been shipped abroad. A change in the Mint administration occurred on the 1st inst., Mr. Dodge taking the place of Gen. La Grange as Superintendent. The old employees will be retained for a time, at least. Frank X. Cicott, the coiner, furnishes the following statement of the coinage during the month of December:

Gold.

Double eagles.....	\$1,920,000	96,000
Trade dollars.....	\$ 573,000	573,000
Half dollars.....	250,000	500,000
Quarter dollars.....	130,000	520,000
Dimes.....	10,000	100,000
Total Silver.....	\$951,000	1,819,000

Grand Total.....\$2,901,000 1,015,000

Coinage of the Half Year.

The coinage of the half year, since the annual settlement in June, has been as follows:

Gold.

Double eagles.....	\$ 21,100,000 1,055,000
Eagles.....	115,000 1,150,000
Half eagles.....	101,000 505,000
Quarter eagles.....	85,500 427,500
Total Gold.....	\$21,390,500 1,120,100

Silver.

Trade dollars.....	\$4,420,000 4,420,000
Half dollars.....	1,520,000 3,040,000
Quarter dollars.....	1,950,000 380,000
Dimes.....	78,000 780,000
Total Silver.....	\$7,118,000 12,020,000

Grand Total.....\$28,512,500 13,740,100

The Year's Coinage.

Coiner Cicott gives the following statement of the coinage at the United States Mint in this city during the year 1877:

Gold.

Double eagles.....	\$84,700,000 1,735,000
Eagles.....	170,000 17,000
Half eagles.....	138,500 26,700
Quarter eagles.....	85,500 427,500
Total Gold.....	\$85,092,000 1,814,100

Silver.

Trade dollars.....	\$9,510,000 9,510,000
Half dollars.....	2,678,000 5,356,000
Quarter dollars.....	2,240,000 8,960,000
Dimes.....	234,000 2,340,000
Total Silver.....	\$14,660,000 26,210,000

Grand Total.....\$99,752,000 28,025,100

The Carson Mint has been in operation since January, 1870. The coinage executed during the year has been as follows:

1877.	Gold.	Silver.	Total.
January.....	\$250,000	\$250,000	\$500,000
February.....	454,000	454,000	908,000
March.....	395,000	395,000	790,000
April.....	\$ 80,000	456,000	536,000
May.....	26,220	275,000	301,220
June.....	162,600	221,000	383,600
July.....	188,000	188,000	376,000
August.....	310,720	217,000	527,720
September.....	145,000	132,000	277,000
October.....	20,000	225,000	245,000
November.....	167,000	167,000	334,000
December.....	154,450	166,000	320,450
Totals.....	\$ 935,920	\$9,085,000	\$10,020,920
1870.....	2,854,215	3,292,350	6,146,565

The amount of coin executed during the past year shows a falling off of one-third as compared with the previous year, chiefly due to smaller gold deposits. This Mint has coined, since it was started, \$21,809,344, of which \$10,625,790 was in gold and the balance silver. The largest coinage was in the year 1876, when it turned out \$6,454,525. In addition to the coinage during the period mentioned, \$24,543,849 in bars was refined. The Mint has been economically managed. In commenting upon the affairs of the Carson Mint, the *Territorial Enterprise*, under date of December 22d, said: The earnings and gains of the Mint from 1870 to 1877 amounted to \$1,318,406, while the expenditures during that period were \$1,519,332, leaving the excess of expenditures over receipts \$200,926. The Mint has, therefore, cost the Government but about \$25,000 per annum during the time it has been in operation. Niggardly appropriations from year to year have somewhat embarrassed the operations of the Mint. Should silver be remonetized,* the increase in silver coinage which must follow will compel a corresponding increase in the operative force and machinery, for both have heretofore worked to their fullest capacity. This, we trust, will not escape the attention of Congress.

The earnings and gains of the Mint from 1870 to 1877 amounted to \$1,318,406, while the expenditures during that period were \$1,519,332, leaving the excess of expenditures over receipts \$200,926. The Mint has, therefore, cost the Government but about \$25,000 per annum during the time it has been in operation. Niggardly appropriations from year to year have somewhat embarrassed the operations of the Mint. Should silver be remonetized,* the increase in silver coinage which must follow will compel a corresponding increase in the operative force and machinery, for both have heretofore worked to their fullest capacity. This, we trust, will not escape the attention of Congress.

The Exchequer Mining Company.

We have received from England the report of Mr. Henry Sewell, on the Exchequer mining property, in Alpine county, in this State. The company is an English one, and being dissatisfied with continued disbursements and no dividends, sent Mr. Sewell here to examine into the causes and report thereon. We have previously referred to the tenor of this report, and having it now at hand, make some extracts from it. After speaking of the geology of the country, etc., he says: "I am not very confident as to finding any quantity of pay ore in these levels, that is from the 200 up to surface. In the 300 there is a point of about 100 feet in length, which looks very promising, spotted about with rich ruby ore, and work ought to be commenced there to prospect it thoroughly. The lode varies continually on this level and becomes hard and compact, and leads me to expect that future explorations may bring us across a body of rich ore. The 400 level has been explored too short a distance horizontally, and driving should be continued on it. Here, close to the face of the level, we have ruby silver spotted all over the quartz, indicating the possibility of meeting a body of ore. I would likewise recommend the sinking of a winze some ten feet from the present face and connect it with a main winze (on the lode) opposite to the present perpendicular main shaft. In this manner the work could be carried on in a cheap and expeditious manner, thus avoiding the present expensive and slow process, namely, that of sinking a perpendicular shaft, (outside the vein) and also of having to drive crosscuts to reach it." The report then speaks of the advantages of shafts driven on the lode instead of a perpendicular one.

"The general mass of the ores up to the present at the mine is too poor to extract, much less to pay freight on it to the mills. Still, small parcels of ore of good quality in many places in your mine, and samples or specimens of rich ruby ore, often assaying \$800, induces me, as a mining man, in advising you to continue your explorations. And this advice I give you conscientiously, as, in miner's parlance, you may be otherwise throwing away a good chance. Especially, and with more reason, as you have no necessity for any further surface outlays on steam hoisting works (of the first-class), mills, furnaces, buildings, roads, etc., which have cost immense sums of money and time.

"The past of this company has been the chronic disease of most English companies in the United States. First sending out a man who was not a theoretical or practical mining engineer, or even a practical miner, and one who had never seen a mine in his life. Then the surface outlays in the shape of mills, furnaces, buildings, etc., have been recklessly premature. A thousand tons lying at the Exchequer mill might be sorted and about 50 tons of \$70 ore be collected. In fact, if the mines could speak they would exclaim: 'We have been robbed of our legitimate rights, and if those large sums of money had not been paid out recklessly and most prematurely on outside works, we would not have fallen into premature ruin.'

"I advise you to pay your debts, especially as I have saved you £9,000 in the arrangements with the creditors, which you can employ in future explorations, and on no account allow a single dollar to be spent on outside works, and only on the legitimate work of developing your mine. The advantages of the district are great. First, your lodes are not hard and are easy of driving. You have cheap timber and fuel all around within a few hundred yards, and all for the expense of cutting. A good wagon road of about two miles leads down hill to the mines. These are advantages seldom found in mining districts."

BULLION SHIPMENTS.—Since our last issue shipments of bullion from the prominent mines have been as follows: Grand Prize, Dec. 28th, \$16,400; Leopard, 27th, \$3,300; Tyho Con., 24th, \$4,030; Northern Belle, 24th, \$3,002.02; Arizona, 27th, \$1,470.17; California, 31st, \$558,903.66; Con. Virginia, 31st, \$540,196.05; Northern Belle, 29th, \$2,797.73; Alps, 31st, \$3,736; Endowment, Jan. 2d, \$2,467.10.

Free Reading Rooms.

We had the pleasure, on Saturday evening last, of listening to the first of the series of lectures for the benefit of the Oakland free library, the subject of this one being "The Drama," by Hon. Nathan Porter. The lecture (a very able one) was delivered in the Congregational church before a large and appreciative audience, embracing all classes of citizens. Following is a list of the coming lectures of the course: "Evolution in Relation to Materialism," by Prof. Joseph LeConte; "Nebular Hypothesis," by Prof. John LeConte; "Irrigation," by Prof. Geo. Davidson; "An Apology for the Turk" (by request), by Prof. Bernard Moses; "Recent Geographical Discoveries," by Hon. W. C. Bartlett; "Our Nerves," by Dr. Dio Lewis. The tickets for the course are sold at \$1, and those for a single lecture at 25 cents. A grand musical entertainment will be given at the close of the course, free to holders of season tickets, but single tickets for this will be 50 cents.

The Union Reading Room Association has done credit to itself and the city of Oakland, in arranging for such popular low-priced lectures in these hard times. It places within the reach of that class deserving of and mostly to be benefited by such entertainments, amusement and instruction combined, at a price with which no fault can be found. As a general thing the cost of such entertainments is so great as to prevent mechanics and other working men from attending; but the result of the experiment

John S. Hager, Irving M. Scott, R. J. Tobin, E. D. Sawyer, John H. Wise, A. J. Moulder, Louis Sloss, A. S. Hallidie, C. C. Terrill and Henry George are instituted and appointed during good behavior, honorary Trustees without salary, of any library or reading room in the city and county of San Francisco. These Trustees are clothed with powers to make rules and regulations for the government of the library or reading room. This is for this city. In other places the term of office of Trustees is limited to four years.

One of the clauses is as follows: "The proprietors of any subscription or other library may, upon such terms and conditions as shall be agreed upon by them and the municipal authorities of any incorporated city, town or city and county, donate and transfer its property, real and personal, to any such city, town or city and county, for the purpose of establishing and maintaining a public library within the meaning of this Act. As a condition of any such donation, such proprietors shall nominate and appoint, as honorary Trustees, a number equal to those authorized, and to be appointed as hereinbefore provided. A majority of such honorary Trustees may fill all vacancies that may occur in their number. Such honorary Trustees shall have an equal voice with the other Trustees appointed, as hereinbefore authorized, in the management and control of such libraries as may be donated and transferred under the provisions of this section."

All this is the direct result of the work commenced in Oakland by a few gentlemen who saw the need of free reading rooms for the public, and who were public spirited enough to give

timber enough to last six months or a year. The company have also a saw mill attached to the hoisting works, by which they dress their timbers, etc. There are only three in the company, Thomas Mootry, Jr., W. A. Coughanour and David Coughanour. They hope to reap a fortune out of the second level, and are proving that there is at least one dividend-paying mine in the Boise country. At the mill they lately crushed some ore for miners on Canyon creek, three miles southwest from this mine. Jack Gorman & Co. and Harding & Co. had rock crushed that yielded \$100 per ton. Packing it to mill on mules and wagons cost \$7 per ton and the milling \$7 per ton. This section is looking up and parties working quartz seem to be going in for making the mines pay on their merits alone and not by assessments as elsewhere. The winter has so far been very pleasant, with some little snow and not very cold or stormy weather. The miners are now taking their comfort and having a good time, hoping for a good mining season next year.

The Sierra Flume and Lumber Company.

We have on several different occasions presented views of the works and mills of the Sierra Flume and Lumber Company, and herewith give one of their Champion mill, which has a capacity of sawing 40,000 feet per day. We have previously given our readers a pretty full account of this company and the work it is accomplishing. The undertaking is the largest of the kind in California, employing over 500 men in the various departments. They cut last year upwards of 50,000,000 feet of lumber and brought it to their yard for sale. The property of the company is worth \$170,000, a portion of which came from their earnings. There are over 150 miles of V flume operated by the company, 157 miles of telegraph lines, and 11 miles of tramways for logs. There are 10 fully equipped saw mills, three planing mills, and one sash and door factory. The mills are run by steam and water.

This company has probably the best system of V flumes in California, everything being built substantially and in the best possible manner. They have tapped the numerous springs and creeks in the vicinity of the flumes, and collected all the available water to furnish as large a supply as possible to the flumes. The engineering difficulties in the way of building

these flumes are even greater than on railroads, and when it is recollected that they are all in a mountainous region, the task accomplished is appreciated.

WHAT IS A "MODOC" ENGINE?—These powerful engines, says the *Coal Trade Journal* are in use on the Pennsylvania railroad. They are taking the place of the smaller engines, and are a saving of both labor and fuel. Their dimensions, etc., compared with the smaller engines, are as follows: Modocs—weight, 96,000 pounds; cylinder, 24x22; driving wheels, 50. Small engines, 74,600; cylinder, 18x20; driving wheels, 54. The Modocs with train are manned by a crew of seven all told. They draw a train of 31 to 37 loaded cars to Philadelphia, and burn on the round trip an average of 275 bushels of coal. The smaller engines and train, manned by a crew of six men, draw only from 20 to 24 loaded cars to the same point, and burn on round trip an average of 200 bushels of coal, that is with the addition of one man to a crew and the additional consumption of about 75 bushels of coal, the company is able to transport from 13 to 16 more cars over the road to Philadelphia.

A MOVEMENT is on foot in Oakland to establish an *Mechanic Arts* school where boys may learn trades. Col. John Scott has made a liberal donation, and the plan is now under discussion.

A TERRIBLE hard winter is anticipated in England, Scotland and South Wales, and the average poor rate will probably be higher than it has been in 20 years.

B. P. KOOSER, an old pioneer, and until lately, editor and proprietor of the *Santa Cruz Sentinel*, died at Santa Cruz on January 1st.

THE "CHAMPION" MILL OF THE SIERRA FLUME AND LUMBER COMPANY.

inaugurated by the Union Reading Room Association shows that low-priced lectures can be made a success. It is noteworthy that Oakland, which has been rather apathetic as to lectures, responded nobly in this case, showing that price had a great deal to do with it.

Another thing in this connection, however, is that the cause is a worthy one. After a great deal of trouble and labor the Managers of the association have provided good rooms, with plenty of papers and books, where any one, the capitalist or laborer, is welcome to come. There are here no social distinctions whatever, one man having equal rights and privileges with another. No fees are charged, and any one who chooses has the privilege of visiting the rooms.

It is to the credit of the Managers that through their efforts Oakland led off practically on the free reading room question; Alameda followed and is doing well. As a result a joint stock association there is erecting a ten thousand dollar building, the largest public hall in Alameda, for the purpose. San Francisco follows, and in examining the field concluded that in the great metropolis of the Pacific it should be a municipal institution, so Senator Rogers—all honor to him—has drawn up a bill which is likely to become a law and the results of which will do an immense amount of good in cities built or now building in California. The Rogers bill to establish and maintain free public libraries and reading rooms, authorizes the various Boards of Supervisors of the various counties, and of the city and county of San Francisco, and the municipal authorities of incorporated towns and cities of this State to levy and collect annually a tax not exceeding one mill on the dollar for the purpose of establishing free public libraries and reading rooms, putting up buildings and buying books. The same authorities may appoint seven Trustees to carry out the ideas of the act. All moneys collected go to a "library fund," and can only be used for the purposes specified. The following 10 persons,

time and labor to inaugurate the one over there. The friends of the Union Reading Room Association hope to advance, and add new and appropriate features to make their good work felt in a wider range of benefits. It is not often that a course of seven lectures is given for a sum of \$1, especially when the lecturers are persons of the education and intelligences such as those chosen by the Oakland association. The cause is a worthy one, and should be upheld by all good citizens, and the example set by Oakland can be followed with benefit by other towns and cities, if a few liberal-hearted citizens take hold of the matter.

From the Boise Country.

We have received the following information in a private letter, concerning the Gold Hill mine, Granite creek, Boise, Idaho: The 25-stamp mill is running steadily on good ore and they hope to keep it going all winter. A shaft has been started to tap the mine at a depth of 250 feet, which will give 150 feet of new ground. They have been working the first level, 100 feet from the surface, for some two years past, in good milling ore. In the Southwest extension of the Gold Hill they struck this summer the original ledge, which had been passed and are now getting splendid ore from it. The mill is running to its full capacity. The mine has besides the mill good hoisting works, etc. W. A. Coughanour is Superintendent; Wm. Frame, foreman, and — Phillips, engineer. The company is working 60 men all told, but when the shaft is down 100 men will be employed. Business is done on a cash basis, all accounts being settled monthly, so they always know where they stand. They have now on hand 1,500 cords of wood, and

Pocket Mining.

A correspondent of the Tuolumne Independent writes on this subject as follows: Many miners when they have the luck to strike a pocket of gold in quartz are content to take that which is in sight, and fancy that this is all to be obtained. This is a wrong idea, for the experience of the best "pocket" miners is, that if after taking out the gold in sight, that if a shaft is sunk, following the "strike" of the quartz, another pocket almost invariably is reached at the depth of 16 or 20 feet, more or less. Of course the richness cannot be calculated exactly, some being richer and some poorer. Yet as a general rule the deeper the deposit the probabilities are that the "pocket" will be in proportion richer. The reason of this will be seen hereafter, because the sublimation of the lower levels is arrested by the mass of quartz above. By continuing to sink, another pocket will be reached; continuing this system of sinking many thousands of dollars will most certainly be taken out, which will be lost to the general miner, who mines in the old-fashioned way and who abandons his lead after taking out the first pocket he has struck. This is important information for pocket miners, and is worthy of at least a trial. It was by this system of mining Nick Bauli's claim proved so rich and prolific in pockets. The Ogden Bros. have also tried it, and found that it worked well, and why should not others find the system to work equally well in their claims? Miners, give it a trial, and see whether the rule is true or not. You have to try somewhere after taking out your pockets, why not where you are? At any rate it is worth while to prove the correctness of the theory. If it be proved true by experienced miners, it will give a new impetus to mining, and add greatly to the wealth of Tuolumne county.

Reasoning this way after a pocket is reached and taken out, the miner ought to sink from 16 to 20 feet at least through dead or unproductive quartz, before he can reasonably expect to find a pocket; but when found do not stop here; keep sinking, and ten chances to one you will be rewarded indefinitely as to depth of the shaft and the richness of the rock. As a rule, when coming near a pocket, colors will be seen in the rock at first scattering, but becoming richer as you approach the pocket. The theory is that all pockets are in chimneys, and have been concentrated into pockets, like the gold in flues where much gold is being melted, is caught on the sides of the flues from the "sublimation" of the gold in the process of "smelting." Webster defines the word "sublimation," as being the "operation of bringing a solid substance into the state of vapor by heat, and condensing it again into a solid by cold." Now if we suppose that as gold is a deep lying metal in a fluid condition its normal state, and that it is now in the quartz as a solid metal, it is probable that in the times of the volcanic ages this was sublimized, and forced up with the molten quartz—for quartz is of volcanic origin. It stands to reason that the gold would be carried up along with the vaporous quartz in the form of a vapor. Now the upper quartz as it receded from the heat of the internal fires would naturally sublime first into a solid, because quartz is not so good a conductor of heat as is the gold. Therefore it is reasonable to suppose that the gold, whilst being sublimated, would be arrested by the cooler quartz. At first in small particles, and as the quartz got cooler, in larger masses, until a "pocket" was formed. Now suppose after one volcanic throes, another some time after occurred, it is probable that, following this same law of "sublimation," another would be found. Following this reasoning *ad infinitum* it is evident that other pockets will be found, and who knows to what depth, or whether this process in not even now going on down deep in the bowels of the earth. Webster also says in regard to "sublimation," that it bears the same relation to a solid that distillation does to a liquid. He remarks that both processes purify the substances to which they are severally supplied by separating them from fixed and grosser matter with which they are connected. If I were to write an hour I could not explain the process better or clearer than he has. You see, therefore, the theory is reasonable and worthy of attention and good trial.

A Question of State.

What shall we do with our squirrels? Twenty years ago there was no ground squirrel nuisance within 20 miles of Oakland. Now the pests are almost ruinous to the cultivation of land close to the limits of a city of 40,000 inhabitants; and so they are spreading thicker and thicker, year after year, over the country. It costs the farmers of this State an immense sum to even partially defend themselves against the encroachment of these pestilential rodents; and still it is a fact that their numbers increase in nearly every district and county in the State. Accordingly the value of land is decreased, or its enhancement retarded. The reputation of our land thus suffers at home and abroad, and the taxable property in the State is to-day nowhere near what it would be if the State and county officials had by legislation given farmers proper power and assistance for exterminating these pests. The reputation of the State is more or less at stake. Now let the present Legislature take some action. No doubt more than one method of encouraging their extermination will be nec-

essary. The more simultaneous that action can be had along the whole line, the more economical will be the results. One thing the State can certainly do to advantage and without loss. It can purchase and properly prepare for use poison in large quantities and furnish it at half the present price to counties and individuals. This would be a great assistance, and cause a great many land-owners to poison squirrels on large tracts where it is now their selfish interest to let the varmints alone. But the State can afford to do better. It can through a commission determine the most effective poison and instruments for killing squirrels, publish reliable information of thorough tests and careful experiments. It can afford to furnish materials to the various counties at one-half the first cost. In turn, the counties can afford to furnish the same to land-owners at one-fourth the State charges, and in that way enable those who will voluntarily contribute their labor to receive the agency of destruction at a very small cost. This may not be the best plan which could possibly be adopted, but we are sure that it is one which would do a large amount of good. STRIKE TOGETHER.

WOODWARD'S GARDENS has the following new attractions: The buffalo, deer, large white skeleton, new museum, improvements in the zoological department, besides the other features which have made it popular.

OUR AGENTS.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.
J. L. THARP—San Francisco.
E. W. CROWELL—California.
A. C. KNOW—Pacific Coast.
C. N. WEST—Santa Cruz, Monterey and San Benito counties.
A. C. CHAMBERS—Tulare, Fresno and Inyo counties.
EDWARD S. BAKER—Australian Colonies and Sandwich Islands.
W. D. WHITE—San Bernardino and Los Angeles counties.
J. W. A. WRIGHT—Sacramento, Placer and San Joaquin counties.
B. E. LLOYD—Alameda, Contra Costa and Napa counties.

F. B. ANDERSON, Nevada.
H. E. HALLETT—San Joaquin, Yolo, Yuba, Sutter and Colusa counties.

TO QUERISTS.

In propounding questions to the editorial, patent or business departments of this office, letter writers should be careful to enclose a stamp and addressed envelope if they wish prompt answer. If we were to furnish time, paper, envelopes and stamps, all free to parties who address this office on matters of more interest to themselves than to us, FIVE HUNDRED DOLLARS A YEAR would not cover the expense. This hint, however, is not intended for parties writing in our own or the public interest, or who would be obliged to delay writing at any time for want of an extra stamp.

Questions of the Times.

Which are the most reliable watches?
American watches, they are driving those of foreign make out of the market.
Which is the best American watch?
The Hampden watch, made at Springfield, Mass.
Why is it the best watch?
Because it is substantial in all its parts, constructed on the best principles and embodies those improvements which experience has shown to be most desirable.
Why is the Hampden watch so popular?
Because in buying one you are sure of getting a good time-keeper. While purchasing a watch of most other makes is like investing in a lottery—a great many blanks to one prize.
Which is the cheapest watch?
The most economical is the Hampden watch. For you can get one of these excellent time-keepers for less than it costs in a short time to patch up a poor watch, which benefits no one but the repairer.
Where can I get a Hampden watch?
By addressing the long established, practical watch-makers and jewelers, DEWEY & JORDAN, 433 Montgomery St., San Francisco, who will send you a descriptive price list, including the following styles of movements: "John Hancock," "Geo. Sam. Rice," "Chas. E. Hayward," "Aaron Egan," "Geo. E. Sandley," "Chester Wolworth," "Frederick Billings," "Railway," "John L. King," "E. W. Bond."

Contents of Pamphlet on Public Lands of California, U. S. Land Laws, Map of California and Nevada, Etc.

Map of California and Nevada; The Public Lands; The Land Districts; Table of Rainfall in California; Counties and Their Products; Statistics of the State at Large.
Instructions of the U. S. Land Commissioners.—Different Classes of Public Lands; How Lands may be Acquired; Fees of Land Office at Location; Agricultural College Strip; Pre-emption; Extending the Homestead Privilege; But One Homestead Allowed; Proof of Actual Settlement Necessary; Adjoining Farm Homesteads; Lands for Soldiers and Sailors; Lands for Indians; Fees of Land Office and Commissions; Laws to Promote Timber Culture; Concerning Appeals; Returns of the Register and Receiver; Concerning Mining Claims; Second Pre-emption Benefit.
Abstract from the U. S. Statutes.—The Law Concerning Pre-emption; Concerning Homesteads; Apendatory Act Concerning Timber; Miscellaneous Provisions; Additional Surveys; Land for Pre-emption; List of California Post Offices. Price, post paid, 50 cts.

Another Complaint.

LOS ANGELES, May 21st, 1877.
MESSRS. DEWEY & Co., Patent Agents, S. F.—Gentlemen:—I have just received my letters patent on machine for opening oyster shells, and compliment you upon your success. I shall not only contribute to you my own business, but also that of friends. Thanking you, gentlemen, for your promptness and the very thorough manner in which you have prosecuted this matter, I am, yours truly,
T. W. TEMPLE.

Any person receiving this paper after giving an order to stop it, may know that such order has failed to reach us, or that the paper is continued inadvertently, and they are earnestly requested to send written notice direct to us. We aim to stop the paper promptly when it is ordered discontinued.

Canadian Patents for U. S. Inventors and Patentees.

One Patent now Embraces all the English Provinces in North America, including the Canadas and British Columbia.

It is only recently that the Canadian Government has granted patents to United States citizens. In consequence hereof the many immensely valuable inventions patented in this country are now patented in Canada. Patents are much sought for and are readily disposed of at fair cash prices. In our country about three-fourths of all manufacturing is based upon patents, especially in the New England States no manufacturing business of any consequence is started without being protected by such. Our neighbors across the border have not been slow in observing and learning that inventions and patents are the foundation of all prosperity in manufacturing purposes. Hence all our patents for labor saving and agricultural machinery and innumerable improvements in home comforts meet a ready market in Canada. Inventors and Patentees should therefore not delay to secure their patents in Canada; many good inventions are already pirated by Canadians, who, against law and right, appropriate United States inventions and have them patented in their own name. After a patent is granted it is extremely difficult to prove who is the first and original inventor. Therefore, inventors and patentees to be safe, you will have to secure your patents in Canada without delay. We have facilities for securing Canadian patents second to none. Our charges for securing Canadian patents are about \$65. A model is required.
Inventors and patentees! do not delay and lose your opportunity. Things may change. With model and description of your invention remit \$25, and we will prepare all drawings and documents and forward them to you for signature. In about 30 to 50 days we can return your Canadian patent.

DEWEY & CO.,
Patent Solicitors, S. F.

TWENTY-FIFTH YEAR—1878.

Hall's Journal of Health.

Contents of a Single Number:

The Little Courtesies of Life; Coughing in Consumption; Influence of Christianity on Medical Science; Ignorance and Ill Health; Rage and Ruin; Kindness the Best Punishment; Grass in Rum; Valuable Table; Incurable Insanity; Consumption—A Suggestion; The Spirit Rapper Premium on Babies; Our Proverbs; Wrecked Clergymen; Marrying Well; The Lifting Cure; Sea Sickness; Face Painting; A Filthy Atmosphere; The Latest Crazy Man; A Suggestion; The Erie Railway; Sick Children.

Published in New York. E. H. OIES, M. D., Editor.

This journal has maintained the highest record of any health journal issued in the English language. It is not the amount of matter published which makes it the most valuable journal, but the plain and condensed truths it furnishes concerning that which is of ever vital importance to its large list of readers.

Annual subscription (post-paid).....\$1.50.
To subscribers of this paper.....75 cents.

TESTING AND WORKING SILVER ORES.—This is the title of an illustrated work of 114 pages, for Miners and Prospectors, by Chas. H. Aaron, published by Dewey & Co. It is written for miners, in plain language, and with all necessary details in description. The author describes the different processes of roasting ores, the appliances, methods of testing ores, testing for a process, working samples, treatment of base metals, use of chemicals, leaching processes, different kinds of crushing apparatus, etc. This little work abounds with useful hints to miners and prospectors, and is written in a practical style. Price, post free, \$2.00. Address, Dewey & Co., MINING AND SCIENTIFIC PRESS, 224 Sansome St., San Francisco.

The Large Circulation of the MINING AND SCIENTIFIC PRESS extends throughout the mining districts of California, Nevada, Utah, Colorado, Arizona, Idaho, Montana, British Columbia, and to other parts of North and South America. Established in 1860, it has long been the leading Mining Journal of the continent, its varied and reliable contents giving it a character popular with both its reading and advertising patrons.

EVERY new subscriber who does not receive the paper and every old subscriber not credited on the label within two weeks after paying for this paper, should write personally to the publishers without delay, to secure proper credit. This is necessary to protect us and the subscribers against the acts and mistakes of others.

THE EXPLORERS', MINERS' AND METALURGISTS' COMPANION.—Comprising a practical exposition of the various departments of exploration, mining, engineering, assaying and metallurgy; containing 672 pages and 83 engravings. By J. S. Phillips, M. E. Price, cloth, \$10.50; in leather, \$12; postage 50 cents. Sold at this office.

KUSTEL'S CONCENTRATION OF ORES (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver ores generally, with 120 Lithographic Diagrams, 1867. The most complete treatise. Published at this office. Price, \$7.50. Postage, 50 cents extra.

FOR GOOD LIVING go to Webster's Palace Restaurant, 218 Sansome Street, S. F. Best of dinners only 50 cents, from 5 to 8 P. M.

MINING LAWS AND DECISIONS.

Copp's Hand Book of Mining Laws.
In this little work is given the United States Mining Laws and Instructions. Also, a digest of the decisions under the laws, by the Secretary of the Interior and Commissioner of the General Land Office.

Forms are given for making out notice of location, proof of labor, application for survey, and in fact all the blanks a miner needs.

There is also a list of all the mines for which U. S. Patents have been obtained from July, 1866, to August, 1877, with location, township and range.

A handy companion for miners. Price \$1, post paid.

The RURAL PRESS holds a leading place in the movement to instill among all workers the need

PACIFIC BUSINESS COLLEGE, 320 POST STREET, Opposite Union Square, San Francisco.

This institution imparts a first-class Commercial Education, a practical knowledge of Telegraphy, and thorough instruction in the English and Mathematical branches, Penmanship and the Modern Languages. It has ever been a cardinal principle in the management of the College to provide thorough and practical courses of study. Every available modern improvement has been introduced, and whatever energy and liberal expenditure of money could do, has been done to place the institution at the head of similar schools.

LIFE SCHOLARSHIPS

For a complete Business Course are issued at the low rate of \$70. This is the only Business College in the State that employs this liberal system of tuition fees. Day and evening sessions during the entire year. Ladies are admitted into all the departments. Each student receives separate instruction. The discipline at the school is excellent. Graduates at the Pacific Business College find little difficulty in obtaining good situations, being preferred by our business men to the graduates of any similar institution. Those who desire to prepare themselves for the practical duties of life, at the least expense of time and money, should examine the merits of this school before attending elsewhere. Send for circulars.

Continued from page 5.

surances have been received from below that work will shortly be resumed.

The Black Jack is looking well, and turning out large quantities of rich ore.

Montana.

WEEKLY BULLION SHIPMENTS.—Butte Miner, Dec. 11: Owing to the suspension of work in the Dexter and Burlington mills in the latter part of last week, the shipments of bullion for the last seven days have not been very heavy. Altogether, from the different mills, and from Messrs. Smith & Kessler's arrastra, there was shipped by Wells, Fargo & Co's express, from the 10th to the 17th inst., 2,343½ pounds of bullion, valued at \$36,150, which is not so bad, being a little over \$5,000 per day.

SILVER.—New Northwest, Dec. 21: Mr. David Carson, Supt. of the Hope M. Co., Phillipsburg, brought up this week 13 bars of silver. Weight, 1,030 pounds—value, \$17,000. This with the nine bars—value, \$3,000, aggregating \$20,000—constituted the November run of that mill. Everything is running well at the Hope.

Oregon.

MINING PROSPECTS.—Oregon Sentinel, Dec. 26: Very little rain has fallen in this section this winter, and our mining population is mostly idle, anxiously waiting for the commencement of the rainy season. The miners are all ready for work, and will begin active operations as soon as they have sufficient water, but the prospects for a very prosperous mining season are not as flattering as they might be.

LUCKY QUEEN.—We are informed from a most reliable source that the owners of the Lucky Queen mine have very great cause to rejoice. From late developments it seems to be established to the satisfaction of those interested that the main ledge has at last been reached, and that the prospect is flattering indeed. It seems that the work heretofore has been prosecuted in the wrong direction, and, consequently, without avail; but a few days ago the work was placed in charge of another Superintendent, who, from his extensive experience in such business, determined to take another course from that of his predecessor, and was rewarded in a very short time by finding only a short distance below the surface, strong indications of that which he was seeking, and has finally struck what, in past experience in quartz mining does not fail, is a large, abundantly rich, and well-defined ledge. This will add another and, we doubt not, permanent attraction toward the rapidly developing mines of southern Oregon. The efforts of this company certainly deserve success, and our best wishes are with them.

Utah.

PARK CITY.—Cor. Salt Lake Tribune, Dec. 29: Two or three important developments have taken place recently in as many old mines, or rather prospects, that have been hitherto neglected. Large bodies of ore, which have been found as yet of low grade, but deeper in the hill, with first-class indications of something better below or further back in the hill. It is too soon yet to announce these discoveries, so many false alarms have been given that we wish to be certain of a great success before we cackle any more. Experience has taught us that we must gain a certain depth below the surface before anything permanent can be expected. Why this is so, it would take too long to explain in a brief letter. If two or more good mines are not developed very soon, then I shall be much disappointed and mistaken, but it will not be the first time and won't kill me.

PATENTS AND INVENTIONS.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of mention:

AIR BRAKE.—H. W. Green and G. W. Hoag, Jacinto, Colusa Co., Cal., and T. P. Cleveland, Mountain House, Sierra Co., Cal. The patent covers an improved automatic arrangement for connecting and disconnecting the air pipes of a railway air brake between the cars of a train, so as to avoid the inconvenience of coupling and uncoupling them by hand, and the liability of their being negligently left uncoupled. The invention consists in attaching a supplemental spring bumper to the truck at each end of every car, where it will not be affected by the varying height of the car body. These bumpers project out somewhat further than the ordinary drawhead bumpers, so that the opposing ends will come together and be tightly compressed

before the ordinary bumpers are connected. The heads of these supplemental bumpers are chambered out and provided each with a valve, which remains closed when the cars are disconnected, but which is opened automatically by the meeting of two bumpers. The air pipe of the air brake is then connected with the chamber in this bumper head, so that the connection of the air passages will be automatically completed when the cars come together and are coupled.

RAILWAY AND CONDUIT.—Jno. B. Ward, S. F. This invention consists in an arrangement of water pipes, conveying water for irrigation or other uses in combination with an ordinary railway for transportation purposes. On the usual ties, pipes are laid. The rails are curved to fit the top of the tubes, and are secured in place by chairs fitted for the purpose. The ties have concave grooves for receiving the pipes, cut at both ends. The distance between the rows of pipe will conform with the gauge of the road. The pipes consist of an inner and outer tube, or binding rings. The inner tube is formed of staves in lengths of any suitable material, so placed as to break joints at the meeting ends. The inner pipe is inclosed by an outer tube or mask of iron. The inventor claims that the combination of pipe and track on the same road bed is of advantage in many ways. The pipe as a support for the rail is continuous and elastic, greatly reducing the danger of accidents from broken rails, and furnishing a smooth roadway. The water pipe by being laid on a graded road bed loses less head and force of water than by the usual way of laying pipe. Any break that may occur is easily found and quickly reached for repairs.

MOWING MACHINE ATTACHMENT.—Samuel Spencer, Turlock, Stanislaus Co. This invention is a novel device to be used in connection with the ordinary sickle of a mowing machine, for the purpose of separating the cut from the standing grass, when the machine is working in fallen or tangled grass or grain the attachment is operated by the same pitman which operates the mower sickle. In mowing tangled grass or grain, especially alfalfa, where only the usual sickle is used, the standing grass being entangled with that which is cut, remains matted together so that no indication is left where the cut grain leaves off and the standing grain begins. This invention consists of a short, upright sickle attached to the outer end of a yoke-shaped frame which extends upward and over the ordinary sickle. This upright sickle makes a vertical cut at the outer end of the ordinary sickle so that the cut grass is completely severed from the standing grass, and the driver of the mowing machine can always tell where to run the sickle so as to cut standing grass.

LIGHT WEIGHT ROPE.—Alfred D. Laedy, S. F. The object of this invention is to provide a rope which will be large in diameter and, at the same time, light in weight. It often happens that rope of large diameter is desired when a much smaller rope would be sufficiently strong; such is the case for instance in supporting painters scaffolds from buildings. A small rope would have sufficient strength to sustain the weight of the scaffold, and the weight of the persons who stand upon it, but it is painful and tiresome for the painters to hoist the scaffold with a small rope, when it would be but a simple task if the rope was of twice the diameter. The improved rope is intended to supply such demands, and it consists of a hollow rope filled with cork or other light flexible filling or stuffing so as to provide the necessary qualities, viz., lightness, increased diameter and the requisite flexibility.

STONEWARE KILN.—Chas. Gladding, S. F. This invention relates to certain improvements in the construction of stoneware and pottery kilns. It consists of a novel method of utilizing the waste heat from the downward draft pottery kiln, and an arrangement of secondary furnaces in a waste heat kiln, which are to be fired after the first kiln is burned off in order to complete the burning of the secondary or waste heat kiln. It also consists in the employment of certain dampers whereby the heat is regulated and the charged secondary furnaces are prevented from burning until desired, and by which all ingress of cold air to the kiln is prevented while these fires are being lighted.

WINDMILL.—R. R. Lander, Turlock, Stanislaus Co., Cal. This invention relates to certain improvements in windmills and regulating devices. There are two vanes, one of which is intended to lie flat and present but little surface to the wind, while the main vane is vertical and holds the wheel to the wind, but when the small vane is turned up the main vane is laid flat. These movements are made together. While the wind blows with moderate strength the main vane will hold the wheel into the wind, but as it increases beyond a certain point it turns a small side vane, which, by appropriate mechanism, allows the wheel to be turned from the wind.

WELL BORING APPARATUS.—W. W. Vaughn and S. Jackson, Stockton. This improved apparatus for boring wells and other holes in the ground consists, first, of an improved arrangement for feeding and forcing the boring apparatus into the earth; second, of a novel arrangement

for hoisting the loaded cylinder to the surface and discharging its contents; third, of a device for steadying and bracing the crowding rod or shaft which drives the auger into the earth; and fourth, of a device for forcing the curbing down the hole as the boring progresses; all compactly arranged and easily operated.

News in Brief.

INDIANS have started on this war-path in western Texas.

THE Hon. Nathan Coombs, the founder of Napa, is dead.

THERE was taken to China in treasure from here in 1877, \$17,601,273.

A NEW tariff bill is being diligently prepared, and will be reported after the recess.

SEVEN vessels and 37 men were lost by the Gloucester fishing fleet the past season.

AN average of five carloads of wheat per day are now arriving at Long wharf, Oakland.

THE Collateral Loan and Savings Bank, of this city, has filed a petition in bankruptcy.

THERE were 2,937 marriage licenses issued in this city in 1877, and 243 divorces granted.

THE French Government has requested Don Carlos to leave France. He started Thursday.

IT is stated that Bismarck is trying to break up the French exposition by some diplomatic movement.

THE weather has been unusually cold for the past week. Ice, three-eighths of an inch thick, formed in Oakland on Wednesday morning.

OUR police forces made 19,262 arrests during 1877, and the Police Court fines amounted to \$23,276.

THE Commissioner of Internal Revenue is opposed to any change in the tax on whisky and tobacco.

A CRAZY man threw himself under the wheels of the San Jose train last week and was crushed to death.

NEW law suits, civil, were instituted in this city in 1877 to the number of 3,969, the Court fees being \$60,831.75.

THERE are less than 2,000 acres of Government land in Iowa and the Sioux City land office has been discontinued.

THE debts of the Pioneer Bank, thus far ascertained, amount to over \$800,000, divided among 1,150 persons.

THE notorious Northampton bank robbers, Scott and Dunlap, have each been sentenced to 20 years in the State prison.

THE American ship *Nimhis*, with wheat from Portland to Cork, was lost off the Columbia river bar the first day out.

THE Internal Revenue receipts during 1877 amounted in San Francisco to \$1,933,752.46. The Custom duties were \$6,692,432.56.

IT is rumored in New York that this Bank of Nevada contemplates establishing its own agencies in New York, London and Paris.

COURTNEY challenges any oarsman in the United States or Canada for any amount and the championship of America—the race to be rowed prior to the Trickett match, in July next.

OVER \$53,000,000 has been paid out by the United States Treasury in the past six weeks, the greater portion to officers and men in the army.

A DISPATCH from Yokohama says: Japan has renounced all commercial treaties and resumed the right to revise her custom duties at pleasure.

A DISPATCH from Washington states that the law officers of the Department of the Interior are making detailed examination of the operations of the desert land grabbers.

EXPERIMENTS are being carried on in Prussia, by order of the German military authorities, to determine how far it may be practicable to employ the telephone for military purposes.

THE Senate Fish Committee, the Fish Commissioners and a committee of fishermen have met in Canada, to discuss matters connected with the salmon of the Sacramento river.

A NUMBER of wealthy gentlemen have bought the large conservatories imported from England by the late James Lick, and sold as part of his estate, and presented them to the city to be erected in Golden Gate park.

CHIEF ENGINEER SCANNELL, of the San Francisco fire department, was run over and had his collar bone fractured while on the way to a fire on Saturday.

W. Y. JOHNSON, formerly of Oregon, is now at Valparaiso, Chile, and writes that common laborers receive but 50 cents per day, and skilled labor ranges from \$1 to 1.50 per day.

A BLIND Italian beggar brought suit in the County Court last week to recover \$100 and during the trial it came out that the plaintiff had \$1,000 to his credit in the savings bank.

REPORTS received at the Department of Agriculture indicate that the wheat crop of this country for 1877 was about 360,000,000 bushels, or 50,000,000 bushels greater than for any previous year.

TEN men, convicted of riot in interfering with mining operations last August, have been sentenced at Wilkesbarre, Pa., to pay fines varying from \$10 to \$100 and imprisonment of from 30 days to nine months.

THE track for the Dumbarton railroad is being laid on the Alameda marsh, near the bay. Piles are being driven for the wharf, and, before long, construction trains will run over the Alameda end of the road.

THE Western Union and the Pacific division of the Atlantic and Pacific telegraph lines have consolidated. Atlantic and Pacific telegraph offices on this coast have been discontinued, except at railroad station.

THE Branch Mint in this city is in operation. There were 243 divorces granted in this city during the year.

Testing and Working Silver Ores.

The above is the title of an illustrated work of 114 pages, for miners and prospectors, by Chas. H. Aaron, which has just been issued by Dewey & Co. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope:

Under the heading of the first chapter, "Testing Ore for Silver," we find paragraphs on ore formation test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working same, applications for testing, roasting, etc. Under the heading of "Working Ores" the author describes Aaron's process, has something to say of superheated steam, preparation of dichloride of copper and protoclauride of copper, use of copper and iron, quantity of chemicals, carbonate of lime chloride ores, amalgam, Patchen's process, etc. He also describes the methods of working roasted ores, treatment of base metals, stirring, heat of furnace, want of sulphur, etc. Under the heading of "Leaching Processes" are the titles, Smelting, Mexican process, Chilean process, Kroehnke's process, etc. Under "Pulverizing Machines" are described the arrastra and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Noice's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, grinding the ore, directions for roasting a barrel, preventing mechanical wear, use of quicksilver, copper in bars, Freiberg barrel, cheap barrel trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improvised retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous mention may be found Aaron's leaching apparatus, with two or three different arrangements, a small mill, sampling tailings and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

The book is a serviceable one for miners and prospectors' use. Price, post free, \$2.00. Address Dewey & Co., MINING AND SCIENTIFIC PRESS, 202 Sansome Street, San Francisco.

SCIENTIFIC PRESS.—As the old year is drawing to a close and the new is rapidly approaching, all our mining friends should subscribe to this scientific journal, especially devoted to their interests. It is a California prize.

WILL. One of the best made in this State for sale cheap on easy terms. Address Dewey & Co., S. F.

(From Pacific Rural Press of Dec. 22, 1873.

OUR PLATFORM.

It is the aim of the publishers to make the PACIFIC RURAL PRESS a vital force in the agricultural development of the Pacific coast. In those methods of practice which secure widest success; in the introduction of cultures which are adapted to our varied conditions of soil and climate; in extending a knowledge of the true science of agriculture, the RURAL PRESS is granted position as a leader, nor do publishers nor editors arrogate to themselves special credit for the proud place which our journal occupies, except as it may be in part the result of their devoted and unremitting labor. For the elements of experience and practical research, in which our columns are rich, we gladly acknowledge our indebtedness to the noblest band of

Correspondents and Contributors

Which any agricultural journal in the world can muster. They dwell in every part of the coast. They are practically engaged in every special branch of agriculture. They are leaders in these branches, by virtue of their own successes. They are men and women who are ever ready to act upon their convictions, that by a comparison of practices and experience, each can aid the other with such timely and valuable information as each gains from his daily work and study. They respond quickly and definitely to all points which arise for elucidation, and thus they make the RURAL PRESS, each week, a compendium of information concerning Pacific coast agriculture, an encyclopedia of the freshest facts and experiences, a treasury of valuable agricultural truth, such as cannot be found in any other journal in the world.

The qualities which we have mentioned as characteristic of our correspondence and contributed articles are those chiefly aimed at in our

Editorial Writing.

We have no luteost to serve save the true advancement of all our readers in all things which unite to secure the truest manhood and the widest success in the field of industry in which they are engaged. We pander to no debasing sensations. We give expression to no sentiment except it be ennobling and elevating. In our search for topics for editorial comment, we glean the whole available field of literature and experience for themes which are fresh and of direct bearing upon the improvement and extension of our agricultural resources, and readers may look to our columns for lessons drawn from progressive agriculturists everywhere.

In this work we spare no pains nor expense, within our means, to enrich our journal with instructive

Engraving and Diagrams

Illustrative of the achievements in breeding of cattle and horses and other farm animals, the introduction of new fruits and trees, the latest improvements in designing and constructing agricultural buildings and rural homes, the beauties of landscape gardening, the fine arts of grafting and propagating; in short, in all lines of progress in which the engraver can aid the writer in the presentation of valuable facts and ideas. All who read our journal concede our marked superiority in the fitness and value and excellent printing of our illustrations.

The matter which is deemed worthy to be brought to the attention of readers is edited

In Departments.

One of the secrets of modern progress in science and industrial art is the system of arrangement and classification of knowledge which has prevailed. This system we find of the highest value in our editorial experience. Each of the departments of agriculture, The Stock Yard, The Dairy, The Vineyard, Horticulture, Floriculture, Arboriculture, The Apiary, The Stable, The Swine Yard, The Poultry Yard and other special branches, are each made the subject of special study and research, and thus facts most important to the success and progress of each, on this coast, are brought forward.

The Home Circle

Is looked upon by the editors of the RURAL PRESS as a pleasant field in which their best and most valuable work can be accomplished. To instruct without wearying; to entertain without demoralizing; to amuse without engendering coarseness; to promote true sentiment, lofty and ennobling emotions—in short, to aid all readers toward the attainment of a higher manhood and womanhood and thus make life more and more a joy and a value, is our constant aim in the careful selection of reading for our Home Circle columns.

By means, both of engravings and descriptions, we inform our rural housewives the styles which are most approved in wearing apparel and aid them in the valuable art of home dressmaking, and a hundred other home arts.

Our Young Folks' Column

Pleases the tiniest birdlings of the flock with its woe stories and funny pictures, and once in a while gives wholesome lessons to their older brothers and sisters.

Good Health.

The RURAL PRESS holds a leading place in the modern movement to instill among all workers the need of a

better understanding of hygienic laws. It gives the latest discoveries for the preservation of health and the best hints for getting the best labors and the truest comforts with the bodies which clothe our intellects and souls. It gives simple remedies for common maladies and accidents, and aims to promote the efforts of the wisest physicians for the strength and healthfulness of the race.

In Domestic Economy.

Which underlies all the economies, the RURAL PRESS extends a helping hand to the housewife and thinks no effort too burdensome which promises to aid her in her arduous work in the kitchen, the dining-room and in the general care of her household.

We believe that the success of the farmer lies in selling wisely, no less than in producing well. Hence

Our Market Review

Is prepared with the utmost care, and no pains are spared to make it fairly and truly reflect the state of the markets. Our quotations are drawn from actual transactions (unless we state expressly that a thing is given as a rumor), and we cite special sales in all cases that we can obtain them. Thus not only do we give each week a schedule of rates at which farm produce is sold and farmers' supplies bought, in this market, but we are always on the lookout along all avenues of information for facts and tendencies which promise to influence the trade in special articles in any way. We claim to keep our readers fully informed of the leading and important trade news, which affects their interests, and we have so far succeeded in winning the confidence of readers that the quotations in the RURAL PRESS are made the basis of transactions in many parts of the interior. We esteem this department of our paper of such great importance that we do not relegate it to reporters but hold it as strictly editorial work, that we may be personally sure of its accuracy and trustworthiness.

Improvement of the "Rural Press."

Our readers assure us that each volume of the RURAL PRESS is better than the preceding one. This is our ambition for the paper. Agriculture on this coast is advancing from the early chance methods and results to the enlightened systems which result from wider experience, fuller investigation and experiment, and the application of scientific truth. As the RURAL PRESS leads in this advancement it bears the mark of it upon its own countenance. We have been able to improve our journal in many ways and to do this the publishers have freely applied the revenues of the paper to its own improvement. They regard it as no temporary enterprise for immediate profit, but are proud to build it up as one of the institutions of the coast, confident that their honor and reward will be greater, even though it be deferred. This policy has both improved the journal in its mechanical departments and has secured the highest editorial intelligence and skill which can be found in this specialty of literary work. By such efforts to improve the RURAL PRESS, the publishers have more than returned the value which subscribers expected when they first bestowed their patronage. This we still expect to do, and the wider our circle of readers becomes the better paper we can send to each. Thus our course is onward, and thus we feel a claim upon the co-operation of all readers in the further building up of our journal.

The Field of the "Rural Press."

Although our first and chief devotion is bestowed upon the agricultural industry of this coast, and here dwell the great mass of our readers, we have groups of subscribers in such widely separated parts that we may fairly claim a world-wide audience. The topics which are presented in our columns are so charged with fresh experiences that they win the attention of agriculturists everywhere. Men who are prominent in progressive agriculture in the Eastern States rank the RURAL PRESS among the first of the journals of its class in this country. In Great Britain and on the continent of Europe, among foreign residents in East India, China and Japan, and in the newly opened world of Oceania, the RURAL PRESS counts its firm friends, and is proud of its ability to interest them and aid them in their work.

Why We Succeed?

The reasons of the gratifying growth and extended influence of our journal are not difficult to determine. First, by the constant co-operation of our readers we are able to make the RURAL PRESS an acknowledged representative of the agricultural interest on this coast. This is of itself a key to success, and it unlocks to us the doors to favor all over the world, for no narrower than this is the fame of our agriculture. Second, we hold the friendship of our patrons everywhere by the freshness and practical value of the matters which we present for their consideration. Third, we win the respect of all truly progressive men because, though ever on the alert to battle on the side of progress, we are never entrapped into worship of the glittering tinsel of the sensational. Our policy is to strive untiringly for better knowledge and elevated practice, but never to let go that which is good, until a better thing is demonstrated. Thus our policy may be defined as a resolute, but yet open-eyed conservatism. This we believe is the only true policy where great industrial interests, and all they involve, are at stake. Fourth, we never abuse the welcome which we gain to the homes of our readers by allowing our columns to carry the specious baits of quacks, confidence men and swindlers. They would pay us roundly for the opportunity to gorge themselves upon our unsuspecting patrons, but the idea is abhorrent to us. We can build up a truer and prouder success without their gold. Fifth, the grand secret of our success lies in the word work, enthusiastic, delightful and yet unceasing work for the success of the PACIFIC RURAL PRESS and all those who come within the circle of its influence.

BOOKS FOR THE PEOPLE.

For Sale on the Pacific Coast at the Lowest Cash Price, by

DEWEY & CO.,

Publisher of the PACIFIC RURAL PRESS.

No. 202 Sansome Street, San Francisco.

WOODWARD'S GRAPERIES & HORTICULTURAL BUILDINGS. Designs and Plans of Hot Beds, Cold Pits, Propagating Houses, Forcing Houses, Hot and Cold Graperies, Green Houses, Conservatories, Orchard Houses, etc., with the various modes of Ventilating and Heating. Price, \$1.

UNITED STATES

Mineral Land Laws, Revised Statutes, AND INSTRUCTIONS AND FORMS UNDER THE SAME.

We have just issued a pamphlet containing the General Mineral Land Laws of the United States, with instructions of the Commissioner of the Land Office. The contents of this pamphlet comprise all of the Government laws with relation to mineral lands of interest to the mining community, as follows: Mining Statute of May 10th, 1872, with Instructions by the Commissioner of the Land Office; Mining Statute of July 25th, 1836; Mining Statute of July 9th, 1870. Forms required under Mining Act of May 10th, 1872, as follows: Notice of Location; Request for Survey; Application for Patent; Proof of Posting Notice and Diagram of the Claim; Proof that Plat and Notice remained Posted on Claim during Time of Publication; Registers' Certificate of Posting Notice for Sixty Days; Agreement of Publisher; Proof of Publication; Affidavit of \$500 Improvements; Statement and Charge of Fees; Proof of Ownership and Possession in Case of Loss of Records; Mining Records; Affidavit of Citizenship; Certificate that no Suit is Pending; Power of Attorney; Protest and Adverse Claim; Non-Mineral Affidavit; Proof that no Known Veins Exist in a Placer Claim, etc. There is also given the U. S. Coal Land Law and Regulations thereunder. The work comprises thirty pages, and will be sold, post-free, for 50 cents. It would be in the hands of every one having any mining interests. DEWEY & CO., Publishers of the MINING AND SCIENTIFIC PRESS, S. F.

THE BEST FILE-HOLDER.—After having used Dewey's patent elastic hinge fileholder for over a year past, the *News* cheerfully indorses it as the best newspaper fileholder in existence, possessing important advantages over any and all others in use. The holders are neat, light and convenient, and the newspapers are placed in them with the utmost facility and least possible time and exertion. They are the simplest, handiest and cheapest of all. Anybody keeping files of papers in reading rooms, offices or at home, should send at once to the proprietor, A. T. Dewey, San Francisco, and get the only proper fileholder. Samples by mail fifty cents.—*Gold Hill News.*

Dewey & Co., 202 Sansome St., Patent Ag'ts.

To Mining Secretaries.

An amendment to Section 336 of the California Code, taking effect July 1st, 1874, provides that in addition to the regular publication, daily or weekly, of the assessment and sale notices as heretofore,

PERSONAL NOTICE

Must be served as provided in the following quotation from the law:

"The notice must be personally served upon each stockholder, or in lieu of personal service, must be sent through the mail, addressed to each stockholder at his place of residence, if known, and if not known, at the place where the principal office of the Corporation is situated."

The above refers to the ASSESSMENT NOTICE only. Advertisers in the MINING AND SCIENTIFIC PRESS will be furnished with copies of assessment notices printed on slips suitable for serving personal notice under this law at short notice.

DEWEY & CO., Publishers.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

California Fruit Growing Assoc'n.—Principal place of business, San Francisco. Location of property, El Dorado County, Cal.

RICKARD'S PATENT

Oxidizing and Chloridizing

FURNACE,

FOR ROASTING

COPPER, SILVER & OTHER ORES

Prior to Leaching or Amalgamation.

The most striking advantages which it offers above all other recent inventions of this nature may be briefly summed up as follows:

First.—Its cheapness, the cost of its erection (ex-royalty and freight) not exceeding \$1,500, for a capacity to roast and chloridize twenty tons per day, viz: brick work, \$1,000, and iron work, including blower, \$500.

Second.—Short time required for erection, viz: 14 days, after providing all materials, with a sufficiency of labor.

Third.—No expensive, heavy or complicated machinery being necessary, involving heavy freight to the district where it may be required. Brick and clay generally obtainable on the spot, being the chief materials required in its construction.

Fourth.—No skilled labor or technical experience is necessary to work it. Two ordinary laborers being sufficient to attend to it when in full operation.

Fifth.—It does not easily get out of order, and is readily repaired by an ordinary mason or blacksmith when it does.

Sixth.—The royalty, or license to use it, is exceedingly moderate, removing thereby all temptation to evade or infringe the patent.

Seventh.—Calculating labor at \$3 per day, and wood at \$4 per cord, the cost of roasting is but little over \$1.50 per ton (ex-salt when chloridized), at these high California rates for labor and fuel.

One of them is now in the course of erection by the Aztec Gold and Silver Mining Company, at their mill in the Aztec District, Santa Rita mountains, Southern Arizona. At their office, 302 Montgomery Street, rooms 14 and 15, a model may be seen, and working drawings, with all further information necessary to enable any ordinary mason to construct the furnace, may be obtained from

COL. J. D. GRAHAM.

25 Pamphlets, with illustrations and full description, sent on application.

THE O'HARRA

CHLORIDIZING FURNACE

Guaranteed to Chloridize from 85 to 95 per cent. of any gold or silver ores that are not more profitable for smelting. Will also desulphurize ores and put them in proper shape for working in cupola furnaces.

Cost of Roasting and Chloridizing 20 Tons in 24 Hours by this Process:

One man.....	\$ 4 00
One man.....	3 00
Wood—23 Cords at \$3 per cord.....	5 25
Salt—1,600 lbs at 2½ cents.....	40 00

Cost of 20 tons.....\$52 25
Cost of one ton.....2 61½

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

The furnace is now working successfully at the Poe Con solidated Co.'s mines, in Peavine District, Nev., and at the Exchequer mill, Alpine Co., Cal. For further information, apply to

D. J. O'HARRA,
Reno, Nevada.

San Francisco Pioneer Screen Works,

J. W. QUICK, MANUFACTURER,

Several first premiums received for Quartz Mill Screens, and Perforated Sheet Metals of every description. I would call special attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using Battery Screens extensively can contract for large supplies at favorable rates. Orders solicited and promptly attended to.

\$1,000 Challenge Ore Feeder.

HENDY'S \$1,000 CHALLENGE ORE FEEDER.

I call my Automatic Ore Feeder the \$1,000 Challenge, because I challenge the owners or backers of any other feeder to a competitive test for that amount. As Mr. C. G. Rodgers, Superintendent of the Green Mountain mine, near Greenville, Plumas county, appears prominently as a detractor of the merits of my feeder, and seems confident that another one is better, perhaps he will accept this long-standing challenge which the owners of other patents will not, and give me an opportunity to prove publicly the superiority of my machine. As to Mr. Rodgers' assertion about my feeder wearing out, it is no less fallible in that respect than other machinery; but I have over 250 now in use, some of them for over two years, and have never had to expend 25 cents for repairs. The fact that my feeder received the premium at the late Mechanics' fair, and that I am shipping several feeders weekly to different parts of the country, is sufficient proof of the appreciation in which it is held.

As to my feeders having been thrown out of the Gold Stripe mill, they were not displaced for inefficiency, as the following letter will show, and it answers also as a complete refutation of Mr. Rodgers' statement:

**OFFICE SUPERINTENDENT OF THE GOLD STRIPE G. M. CO., }
GREENVILLE, PLUMAS CO., OCT. 16TH, 1877. }**

JOSHUA HENDY, Esq.—Dear Sir:—Your favor of the 15th instant at hand. In reply to your inquiry as to the working of your ore feeders at our mill, we can say that there is no fault in the machines, and we consider them the best now in use. At present they are not in use with us, owing to the construction of the mill, which we are about to rebuild and make proper arrangements for putting in your feeders.

J. K. OWEN,
Superintendent Gold Stripe Mine.

One of the principal owners of the Gold Stripe and Green Mountain mills is also largely interested in the Plumas National mine, where I have just shipped several feeders, showing the confidence placed in the machine by these gentlemen who have used it.

Now, if Mr. Rodgers is sincere in his belief as to the merits of a rival machine over mine, here is a chance for him to make a thousand dollars easily, if he can get the owners of the machine to lend him one for the trial, which is the only doubtful thing in connection with the matter. Mr. Rodgers' eight months' experience with both machine ought to give him confidence enough in his own convictions to accept the challenge offered to him, or any one else.

JOSHUA HENDY.

Corner Fremont and Market Streets, San Francisco.

It may be considered as now fully demonstrated, by careful and long-continued experimentation, that the plan upon which a perfect ore feeder must be constructed is that of the carrier, and not that of the shaking table. Uniform and accurate feeding is not possible upon the latter plan. The ore must be evenly carried, upon a steadily advancing plane or table, to the line of discharge, and there simply dropped. Spasmodic or jerky contrivances will not answer the purpose.

We warrant the machines to give perfect satisfaction, and to be a better and more durable Feeder than any other the market, and will sell them as cheap as any other of its class.

REGISTER YOUR TRADE MARKS.

The U. S. Government now offers greater protection than formerly to manufacturers under the law of Trade Marks.

Those who manufacture a superior article, or put up improved packages of merchandise, should protect themselves from imitations by registering their Trade Marks. We have special facilities for securing full rights by the registration of Trade Marks, and our terms are very reasonable.

Consultations free. Many dealers have missed fortunes from not being fully informed and protecting themselves in their rights.

DEWEY & CO., Patent Solicitors,
No. 202 Sansome Street, S. F.

A. T. DEWEY,
W. B. EVER.

JNO. L. BOONE,
GEO. H. STRONG.

Among the advantages gained by this holder are the following:

It can be opened and closed quickly.

The points are less obstructed while the articles to be filed are being placed.

The papers (wholly or partly folded) can be either "straddled" over the lower bar, or filed in regular book order.

The elastic hinge and band accommodate and hold firm either a large or small number of papers.

With less material, it is lighter and less cumbersome than other holders, and approaches nearer to bookbinding.

It has no rigid hooks, hinges or loose parts to break or get lost.

It has proved durable in practice. The file is adjusted but 52 times a year for a weekly paper, and a simple holder can be opened and closed 1,000 times without showing wear.

Five sizes are made to suit the dimensions of different papers, viz.: 18, 25, 30, 36 and 34 inches, inside measure.

Single samples will be mailed from office for 50 cents, (and upward, according to size), postpaid. Wholesale and retail agents wanted.

Peerless Corn Sheller.

It is so cheap (costing only \$6), that almost any one can afford to buy one. It is so rapid, it will shell almost as fast as a \$40 machine, and seven or eight bushels per hour is not above its capacity. It weighs only 13 pounds and is simple and durable. For particulars, address

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY &
CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL,
MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the
Extraction of their respective Metals without Quick
silver. 1870.

This rare book on the treatment of gold and silver ores
without quicksilver, is liberally illustrated and crammed
full of facts. It gives short and concise descriptions of various
processes and apparatus employed in this country
and in Europe, and explains the why and wherefore.
It contains 142 pages, embracing illustrations of fur-
naces, implements and working apparatus.

It is a work of great merit, by an author whose reputa-
tion is unsurpassed in his specialty.

Price, \$2.50 coin, or \$3 currency, postage free.

Concentration of Ores (of all kinds), including
the Chlorination Process for Gold-bearing Sulphurets,
Arsenurets, and Gold and Silver Ores generally, with
120 Lithographic Diagrams. 1867.

This work is unequalled by any other published, embrac-
ing the subjects treated. Its authority is highly esteemed
and regarded by its readers; containing, as it does, much
essential information to the Miner, Metallurgist,
and other professional workers in ores and minerals, which
cannot be found elsewhere in print. It also abounds
throughout with facts and instructions rendered valuable
by being clearly rendered together and in simple or-
der. It contains 120 diagrams, illustrating machinery,
etc., which alone are of the greatest value. PRICE, \$7.50.

Designing and Engraving at This Office.

We are prepared to do fine Wood Engraving
for illustrating Landscape Scenery, Buildings,
Machinery, Works of Art, Manufactured Arti-
cles, Trade Marks, Seals, etc. We have a
first-class

Machine for Engraving

A portion of the work, which can be finished
thereby more perfectly than by the eye and
hand alone. Our patrons can depend upon
first-class work always, and at reasonable prices.
Samples can be seen at our office.

DEWEY & CO.

Mining and Scientific Press

Is the leading mining journal in America, and enjoys a
large circulation among the more intelligent operators and
workers in the gold fields of the world.

As a scientific and mechanical representative of the Pa-
cific Coast, it is decidedly popular and a standard journal
with the most thrifty industrial people of the Pacific
States and Territories. Its authority is of the highest
order, and its usefulness in its special sphere unrivaled.

Every public library, mining engineer, metallurgist
mining operator and intelligent mechanic and manufactu-
rers will find profit by its reading.

Subscription, \$4 a year in advance. Sample copies, post
paid, 10 cents.

Since the Victor Rock Drill

Was brought to the notice of the public at the Centennial
Exposition in Philadelphia, in 1876, where both the
Diploma and Prize Medal

Were awarded it, and where it was practically tested in
hard rock, drilling more than 1,000 holes of various sizes
from one-half inch up to six inches in diameter, and at var-
ious angles. It is rapidly being sent throughout the
world. With this simple HAND MACHINE

Two Men Will do the Work of Six or Eight

In the old way. Hence a number of parties who at first
purchased but one for trial, have since ordered two,
three, four, five, eight, twelve and even twenty-four more.
An EMERY WHEEL is attached to every machine for
grinding the bits when dull.

MINING AND SCIENTIFIC PRESS

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO.,
Patent Solicitors.

SAN FRANCISCO, SATURDAY, JANUARY 12, 1878.

VOLUME XXXVI.
Number 2

Smelting Fine Ores and Tailings.

Geo. P. Evans and Wm. P. Prescott, of Carson City, Nev., have patented, through the MINING AND SCIENTIFIC PRESS Patent Agency, a smelting furnace and condensing attachment for melting fine ores, without subjecting them to any preliminary preparation, such as converting them into bricks, by mixing them with an adherent substance, as has been necessary. The furnace is an upright or stack furnace with the usual fire-brick linings, the body being made double, so as to form a water-jacket entirely around the furnace, into which a constant circulation of water is maintained through a pipe at top and bottom. The furnace is made in a double-cone shape, that form giving a large fire surface and concentration of the ascending volume of heat. The fire-grate, ash-pit and tuyere-pipe are as usual. A passage leads downward from the center of the ash-pit, through a short pipe at the lower end of the furnace, and conveys the melted metal into a crucible.

The door, through which fuel is supplied, is a considerable distance above the grate, so that when the fuel is introduced it will fall upon the burning fuel on the grate. A large cylinder is mounted horizontally upon a suitable support opposite the upper end of the furnace. This cylinder serves as a flue and condenser both. The top of the furnace is closed tightly by a cover, from the center of which a curved pipe leads into the end of the cylinder and serves to conduct any fumes generated in the furnace, together with the products of combustion, into the cylinder.

Each end of the large cylinder is closed by a head, similar to a boiler-head, and a pipe leads from the center of the top of the furnace and enters the cylinder-head. Inside the cylinder are secured two partition-plates or flue-sheets, one near each end of the cylinder, thus dividing the cylinder into three compartments, the middle one of which occupies a greater part of the cylinder. These sheets are connected by means of one or more flues or pipes passing through the middle compartment, but communicating with the end chambers. A vertical pipe passes up through the bottom of the cylinder and is connected to each of the flues by a T-coupling.

Water is admitted into the middle compartment through a pipe above one end of the middle compartment and is allowed to escape through a pipe at the bottom of the cylinder, near the opposite end of the compartment, so that when the furnace is in operation, a continuous circulation of cold water can be kept up through the chamber, for the purpose of condensing the fumes which attempt to pass through the flues. A smoke-stack or draft pipe is connected with the outer compartment of the cylinder.

The process of smelting fine ores and tailings consists in feeding them into the upright or stack furnace, at some point near its upper end, and allowing them to fall through the upward ascending flame and heat and drop upon the burning fuel on the fire-grate. To this end, therefore, the feed-opening is near the top and at one side of the furnace. The fuel falls upon the grate, while the blast from the tuyere creates an intense heat inside of the furnace. As the heat and products of combustion rise upward towards the curved flue, the fine ore or tailings is showered by means of an automatic

feeder through the opening and descend, through the upward rising heat until it falls upon the burning fuel, where the metallic portion soon becomes smelted and runs off through the short pipe into the pot or crucible.

In smelting pulverized or fine ore, the condensing attachment need not be used unless the ore contains some metal which gives off vapors which it is desired to recover. But the chief use of the condenser is when tailings are being smelted. Tailings almost always contain a large percentage of quicksilver that escaped in the original treatment of the ore, from which they are derived. Therefore, when the fumes from the tailings pass through the curved pipe, they enter the first chamber of the cylinder. This is a dust-chamber, where all that portion of the fine ore, whose specific gravity has not been sufficient to carry it downward against the upward draft, will settle and be caught. The lighter and more volatile portion, together with the metallic fumes and products of combustion

The Cope & Maxwell Mining Pump.

We illustrate on this page the Cope & Maxwell plunger pump, which is peculiarly adapted for mining purposes. This pump was arranged expressly to meet the wants of the deep mines on the Comstock, as auxiliary pumps in the inclines, winzes and the lower levels, for which work it has superseded other direct-acting steam pumps. The plunger works in soft packing and lasts a long time; moreover, it does not require to be an exact fit to the pump cylinder.

The pump has only been introduced within the past two years, but its success as a mining pump has been somewhat remarkable. The following mines on the Comstock are now using from two to four of these pumps: Yellow Jacket, Belcher, Crown Point, Justice, North Con. Virginia, Gould & Curry, California, and

No Mining Board for Chicago.

Dispatches from Chicago state that the people there are losing faith in the project of a mining stock board. At the meeting held on Monday night for organizing the board, no results were accomplished worth mentioning. It is said that the characters of one or two men who are most interested in it is enough to condemn it and to secure general opposition to its establishment. Some New York and Western agents have been active in getting it on foot, but their efforts appear to be fruitless. It is charged that it will be established, if at all, simply for stock gambling and not for legitimate business.

This is exactly the view of the matter that occurred to us when the idea was first started some months since, and we took occasion at that time to remark that if the Chicago people wanted to invest in mines for legitimate mining purposes, they could accomplish the object better by not having any stock board at all. If they wanted to go into gambling in mining stocks, the move was all very well; but as far as real mining work is concerned, there is not the slightest necessity of a board for carrying it on. The board is simply a place where stock can be bought or sold by paying commission to certain men who, by paying for a seat, have acquired a right to sell or buy for others. These are the men who make all the money, for they have a sure thing of it both ways, selling and buying.

There are so many evils connected with the buying and selling of mining stocks, that they have covered up the good points almost entirely. Here, where we have had the most experience in the business, the Legislature is even now discussing methods and devising plans to prevent the evils which are the outgrowth of the system. People in the East hear of immense fortunes made in our stock market, but they do not hear of the disastrous consequences which befall so many who enter it. Those who have made the largest fortunes, it must be remembered, are the ones who have had opportunities not open to the common run of men, of getting "inside" information and of manipulating the stocks one way or another. It must be remembered, moreover, that the large fortunes of the "bonanza kings," for instance, have been made from legitimate mining rather than from the fluctuations of stocks. The men of whom we heard a few years ago as having made monstrous fortunes from stock are now unheard of comparatively, and even the brokers are not the prosperous community they once were.

The buying and selling of mining stocks, as the system was inaugurated, was an excellent way of enlisting capital for mining operations; but, unfortunately, there are so many tricks and curious transactions connected with it, that the system has no longer the confidence of the public. Chicago can do very well without a mining board, for if it was intended only as a stock gambling arrangement, the citizens would have more money in their pockets at the end of the year without than with it. No business in the world holds out better inducements for profitable investment than mining, pure and simple; but stock dealing is not mining. If legitimate work is intended we should gladly see our Chicago friends make some investments here, but unless this is the case they are better off as they are.

THE COPE & MAXWELL PLUNGE PUMP FOR DEEP MINING PURPOSES.

will pass through the flues in the chambers. These flues being surrounded by cold water, the instant the metallic vapors enter them they will be condensed and precipitated and the gravity of the particles will cause them to flow down through the vertical pipes into a receptacle prepared to receive them, while the products of combustion pass on through the smoke-stack into the open air.

By this means the inventors claim to be able to smelt fine ore and tailings without preliminary preparation. The fine ore falling through the ascending draft and heat will become thoroughly oxidized, so that by the time it strikes the burning fuel it is ready to part with its metals, while the previous oxidation of the base metals will avoid any liability of its slagging. In treating tailings, the inventors prefer to subject them to a concentrating process before submitting them to the smelting process, as they can thus get rid of a large proportion of the worthless stuff. This preliminary treatment, however, is not a necessity.

THE Board of Engineers have approved Capt. Eads' work on the jetties at the mouth of the Mississippi and the Cabinet has decided that he shall receive the money appropriated by Congress upon compliance by him with the legal provisions.

others. The K. K. Consolidated, Navajo, and other "outside" mines are also using this machine.

The engraving represents a pump specially adapted for high lifts, and capable of handling from 10,000 to 25,000 gallons of water per hour with economy, with the use of either steam or compressed air. The pump is made of varied capacity and weight, according to the work expected of it. The Cope & Maxwell manufacturing company make all styles of steam pumps and water-works machinery, including the celebrated "Isobronal pumping engine," a description of which we shall soon give for the benefit of our mining readers and those having large quantities of water to handle. Parke & Lacy, No. 417 Market street, in this city, are sole agents for the Pacific coast.

RICKARD's patent oxidizing and chloridizing furnace, for roasting copper, silver and other ores, prior to leaching or amalgamating, is the newest metallurgical appliance. Mr. Rickard now offers it to the notice of the miners and mill owners of the Pacific coast with every confidence that it will fill a requirement long felt, either by the wealthy corporation or needy miner. This furnace can be put up cheaper than any in the market.

CORRESPONDENCE.

It is the desire of the editors of this journal to be liberal toward all correspondents, and therefore statements and opinions are frequently published, on the authority of the writers, for which we do not assume responsibility.

Calaveras County Mines.

EDITORS PRESS:—The Banner mine, formerly known as the Grassbopper, owned by A. J. Rhodes, Esq., and superintended by Col. J. W. Johnson, is now being systematically worked, and the richest kind of rock has been struck while sinking. The vein is about one foot in width, and shows free gold in large quantities. Under the present administration a new engine, capable of sinking 1,000 feet, and boilers have been placed on the mine, everything being in first-class shape. About 30 men are employed, and Col. Johnson, aided by Mr. John P. Spalding, has made a success of the undertaking.

The Blue Jay

Is the property of Potter, Spalding & Co. They have recently placed a whim upon their mine, and are running a full force of hands. Everything is lovely here, and is yielding as rich ore as ever. Their last crushing of about 50 tons paid over \$100 per ton. Hazard W. Potter, the locator of this mine, discovered another prospect on Christmas day, said to be exceedingly rich. The new discovery is located near the Banner hotel.

The Hortense

Owned and worked by Messrs. Lewis & Fairchild, recently crushed about 40 tons of ore, their first lot, which cleaned up about \$26 to the ton. They are still at work, and have plenty of the same kind of rock on the yard.

Peter Gass & Co.'s Mine

Was recently sold to San Francisco parties for \$3,000; terms, cash. Rock from this mine pays about \$13 per ton. About four tons can be taken out per day of two shifts (10 hours), two men each shift, one below and one at the windlass. Depth of shaft, 65 feet; J. J. Holmes, Superintendent, assisted by J. V. Toner.

The Valentine

Was in early days worked by Mexicans, and about 30 arastras were constantly employed in working its rock. It is estimated that several millions of dollars have been taken from the mine. Experts pronounce it to be as good as ever. This is a wet mine, and is now lying idle. Cause: want of funds to place machinery on the ground. Dave Lamson, owner.

The Grand Central

Main shaft is down about 130 feet; tunnel to tap the shaft, 300 feet; vein from four to six feet in width; rock low grade—about \$8 per ton—but lots of it. I will state here that rock in quantities can be worked for about \$2.50 per ton. Hoey & Toner are the owners. The mine is superintended by John L. Hoey, who was Superintendent of the San Bruno in its palmy days.

Harry Hausen

Has commenced operations on the old Richman mine, with flattering prospects, and also working his own claim, the "Glad Tidings," which pays \$70 per ton.

Hartwell & Co.,

Are now in San Francisco making arrangements for a new 30-stamp mill, and claim they will be able to crush rock for \$2 per ton. There are a great many of low grade mines in this vicinity, and a mill that will do this will be kept constantly employed. Monopoly has held its sway long enough here.

Holmes' Mine

Is worked by tunnel and is in about 400 feet, and still continues to yield good quartz. This mine has a good 10-stamp mill. J. J. Holmes, owner.

Times in Mosquito are looking brighter at present than for several years. A Philadelphia company and an English company are making arrangements for starting up some of the idle mines, and we are all looking forward for a bright future. The Banner hotel is crowded with guests, likewise the other houses. Hoey's saloon, at night time, puts us in mind of the days of '49. Garland's mill, of 18-stamp capacity, is running night and day. The two leading mines pay off from \$15,000 to \$20,000 monthly.

ONALD.

Mosquito Gulch, Calaveras Co., Dec. 31st.

The Alta Works.

In passing, we yesterday dropped in and spent a few minutes in looking through the Alta works. The first thing that will attract the attention of the mining man who visits these works is the splendid and powerful pumping engine. It is one of the latest style, geared directly to the bob, and works so smoothly and noiselessly that one hardly knows there is an engine about the place.

A peculiarity of the pumping apparatus of the Alta is that no balance hobs are used on the pump rod. Instead there are two rods. One comes up as the other goes down. The main shaft was yesterday 1,170 feet in depth, yet this arrangement of the rod or rods was working most smoothly and perfectly.

The rods are suspended upon a large pulley by means of a heavy steel wire cable. The

ends of this cable are securely attached to the rods which are thus suspended from the pulley—the pulley carries the weight of the rods. As greater depth is attained and a greater length and weight of pump rod is required, another pulley may be put in to sustain the additional weight.

The influx of water at the bottom of the shaft is not great, as it is only necessary to run the pump at the rate of two strokes per minute. It can be run up to eight or ten strokes per minute if required.

The new hoisting engine is working to perfection, and is sufficiently powerful to sink to the depth of 2,000 feet. The small engine—40-horse power—used until last Saturday, was yesterday being taken up and moved out of the works.

An air compressor is being set up and will be ready to go into operation to-morrow. It will be used to furnish air for an Ingersoll drill, which is about to be put up for work in the crosscut on the 1150-foot level. Heretofore all the drilling in the mine has been done by hand. The progress made will now be much more rapid. The compressor will also furnish air for a small engine, which will drive a small blower to furnish air in the underground regions.

A new carpenter shop is about completed at the south side of the main building. The building is 30x60 feet in size. A new blacksmith shop, 30x40 feet in size, has just been completed.

A new building is about to be erected at the east end of the present main building. It will take the place of the present main building from the galleys frame eastward. This new addition will be 34x62 feet in size, and from the floor to the peak of the roof will be 62 feet in height.

It has been found necessary to thus enlarge the main building, for the reason that a new hoisting frame, or galleys frame, 48 feet in height, is about to be put up. Work on these improvements will be commenced to-day.

When the changes and improvements now in progress have been made, the Alta works will contain the best and snugest outfit of machinery to be found on the lead, though not the most powerful. They will then be in a position to push work underground at a very rapid rate. They may not only vigorously prosecute the sinking of their main shaft, but may also push forward their prospecting operations on the 1150-foot level, and at levels below as fast as they are reached.—*Virginia Enterprise*.

NEW PUMPING ARRANGEMENTS.—The Manhattan company are making a change in the arrangements for draining their mines. Hitherto the South American shaft has been the pump shaft of the series of mines comprising the Frost and Curtis shafts and Allsopp incline, but the pumping works are to be removed to the North Star shaft. The South American is but 400 feet deep, while the North Star shaft extends to a depth of 600 feet. At present the water flows to the 400-foot level of the South American, whence it is pumped to the surface. When the pumping works are removed the water will be pumped from the 430-foot level of the North Star, which is equivalent to the 400 of the South American, but the arrangements will be such that the mines can be drained from the bottom by the North Star pumps should a large reservoir of water be encountered at the lowest depths of the Curtis and Frost workings; and the putting in of the pumping machinery in the North Star is a preparation against such a contingency. The North Star shaft has been entirely retimbered and is now in first-class order, and when the pumping machinery is removed to it the South American shaft will be practically abandoned, as it will no longer be of any benefit, and keeping it open would only be a useless expense. The improvements and changes made and being made in the Manhattan mines all tend towards concentration of labor, steam and machinery, and all useless works will be discarded.—*Reese River Reville*.

BEAUTY OF NATURE.—I am never more convinced of the progress of mankind than when I think of the sentiment developed in us by our intercourse with nature, and mark how it augments and refines our moral culture, and also (although this is not so generally admitted) with our scientific knowledge. We learn from age to age to see the beauty of the world; or what comes to the same thing, this beautiful creation of the sentiment of beauty is developing itself in us. Only reflect what regions lovely as Paradise there are over all Asia and Europe, and in every quarter of the globe, waiting to receive their fitting inhabitants—their counterparts in the conscious creature. The men who are now living there do not see the Eden that surrounds them. They lack the moral and intellectual vision. It is not too bold a thing to say that, the mind of man once cultivated he will see around him the paradise he laments that he has lost. For one "Paradise Lost," he will sing of a thousand he has gained. How every tender as well as every grand sentiment comes reflected back to us from the beautiful objects of nature! Therein lies their very power to enchant us. Nature is full of our own human heart. That rose—has not gentle woman leant over it, and left the reflection of her own blush upon the leaves and flowers? To the old man there is childhood in every bud. No hand so rude but that it gathers with the flower more and other beauty than what the dews of heaven have nourished in it.—*William Smith*.

The Gravel Mines of Nevada County.

From a trip to neighboring mining camps in Nevada county the Dutch Flat *Forum* gleaned the following items regarding the mines, their location, etc., some of which are paying well, and the others considered valuable on account of their locations, and are all receiving marked attention in being worked and prospected. Democrat hill, of which but little has been said through the *Forum*, is the upper or farthest north as yet of a series of mining claims located on an ancient channel, that if not the entire was certainly one of the main depositors of the auriferous gravel banks of Dutch Flat, as its course is left plain and traceable by the immense deposits of gravel that are now only disconnected in places by Bear river and Steep hollow, and run via Elmore bill, Liberty hill, Lowell hill, Remington hill to Democrat hill, a distance of 10 miles, running from north to south. This channel emerges from a mountain north of Democrat hill, and no doubt, is the outlet or continuation of the channel that passes through Omega and Washington. The deposits of gravel at this point are very extensive and also rich, out of which a great deal of money has been taken as early and as continuously since 1854, by means of drifting and working the shallow ground with pick, pan, rocker and sluice boxes. The principal mine at this place was purchased recently by a company from French Corral from F. Skeahan, who had the claim by purchase and pre-emption, which has a frontage of 1,200 feet, running parallel with the channel to the divide of the mountain, 1½ miles in length, and on which the depth of gravel will average about 400 feet. Several hundred feet of tunnels have been run recently by Mr. Skeahan for the purpose of opening up and working ground that will pay well for drifting, but we understand that the company now owning the ground intend to work it altogether by the hydraulic process.

This channel, on leaving the above mine, separates or forks, one branch still running south and the other in an easterly direction. The continuation of the latter which marks its short course to reach the north bank of Steep hollow, leaves a deposit of about 10 acres of ground, with an average depth of 150 feet, and is known as the Clipse mine. For a drift mine this is said to have been one of the richest ever worked in this section, but by which process it has ceased to pay. It is now owned by the Wick Bros., who have fitted it up for hydraulic, and out of which they expect to realize a large fortune.

To follow the course or father development of this branch of the channel brings us to the southern bank and divide between Steep hollow and Bear river, where another forking or separating takes place, but as yet little prospecting has been done at this point, although to judge from the extensive size of the increased branches would lead to the belief that they have been assisted in their development by another channel coming from the north. However one fork continued to extend in an easterly direction, leaving and reaching what marks its course a large deposit of gravel on the north bank of Bear river, known as the Kinder claim, where opposite and immediately below in the river was found the rich mines located on what is still known as Buffalo slide. Thus then mysteriously ended what still remains a secret, any further continuation of the fork or channel, as no tracings of it has ever been found in the lava beds which predominate opposite on the southern bank of Bear river. The other fork of this branch heads and hears south and again connects with the fork it separates from at Democrat hill in the Skeahan and Swamp Angel mines at Lowell hill. Nearly all of the mining ground lying north of the last named claims, on this divide, is covered by a patent, the property of Kinder, Gould & Co.

Returning to the starting point or southern fork of this main channel, as it leaves Democrat hill, the first mine we come to worthy of mention is the present much noted Wide West mine. When we say noted we do not mean it altogether on account of its richness, but partly on account of the singular formation connected with it. On either end is the Skeahan and Rhode Island mines, one with an average depth of 400 feet of gravel and the other 200 feet, and although the Wide West mine is the connecting link between the two, the bed of gravel found in it does not average three feet in depth, the balance of the deep surface being composed mostly of lava. But then, even with this limited amount of gravel, the Wide West is a valuable mine, and in it 26 miners find employment. Tunnel No. 1 has not been advanced any since our last mention. No. 2 is now 600 feet in length and a second drift opened to the east for the purpose of opening other breasts, when the force of miners will be increased. This mine continues to pay splendidly.

The Rhode Island mine is fitted up for hydraulic and the company are now anxiously awaiting the coming rains.

At Lowell hill several men are employed getting out timbers for the Jimmy hill mine.

Fourteen miners are employed in the drifts of the Swamp Angel mine. The main tunnel will be advanced, new breasts opened up and the force of miners increased as soon as enough rain falls to supply sufficient water to run the

air-blast to furnish the drifts with good air. The Angel as usual is paying well.

No gravel has been tapped in the Wild Cat mine yet, although the tunnel is in over 1,400 feet.

The Little York company's mines, at Liberty hill, are extensively fitted up for hydraulicing and will be put in active operation as soon as water can be had.

Mineral Wealth of Turkey.

The Grand Vizier is doing his best to create new resources, but he is nearly at his wit's ends. As a last expedient he proposes to lease the working of the coal mine at Heraclea, on the Black sea, in security for a new loan he is trying to negotiate. This mine produces a good coal, and as it lies near the sea there is but little difficulty in the transport of the coal. The Turks have never been successful in mining operations. They have but few men of practical science, and then there is so much rascality among their officers that there is but little net revenue from such undertakings. They are too jealous of foreigners to concede their mines to them. The empire abounds in mineral wealth of all kinds, particularly Thessaly, Bosnia and Asia Minor. On the slopes of Olympus in the vale of Tempe, an English company has for many years been engaged in mining operations, chiefly among the silver and gold deposits imbedded in the fanes of this rendezvous of the gods of Grecian fable. This is the only foreign company of any note that has been able to obtain a valuable concession in the mineral districts. Bosnia abounds in copper, lead, zinc, silver and iron of the first quality. Should it fall into the hands of Austria, as it is likely to do in the settlement of the Eastern question, it will prove a source of great wealth to that government. It is the opinion of a celebrated Russian scientific writer, who explored Asia Minor in detail some 10 years ago, and who published the results of his survey, that the sands of the Pactolus, if properly worked, would afford from the accumulated deposits it has piled upon its shores, a rich yield of gold, if not as great as it did to Croesus, yet in quantities that would astonish the world. At various epochs the Pactolus has revived its fame as a gold-bearing stream. The grains of the precious ore found in its bed and on its shores are, no doubt, triturated from the quartz rocks in Mount Imolus, where lie its foundations. In the time of the Lydian kings the gold treasure of the Pactolus made Sardis the richest city in the Eastern world. Shafts sunk in the bowels of the mountain and crushing mills after the California pattern might render the Pactolus and its mountain region as famous as in ancient times. But this will never happen under the slothful, unenterprising domination of the Turks.

Silver Reef

The *Pioche Record* learns the following items in regard to affairs in and about Silver Reef: The mill built by the Christy M. & M. Co. is on line between Bonanza City and Silver Reef. It has five stamps, six pans and three settlers. The machinery was furnished by Prescott, Scott & Co., of San Francisco. The contract for building the mill was let to White & Allen, the contract specifying that it was to be a first-class mill in every respect. As a guard against fire a four-inch pipe, 1,500 feet in length, has tapped the main ditch of Quail creek, and the pressure at the mill is 65 feet, thus insuring a bountiful supply to the mill both for use and in case of fire. They expected to start up on the 2d inst. The company's mines are the Silver Flat, Tecumseh, Silver Point, Chloride Chief, Silver Crown, Maggie and California; the five first being purchased from Barbee, the Maggie from the Willett brothers, and the California from Grant, Giffried and Brisacher. The company expects that with these mines they will be compelled to erect a larger mill. The Rock Cliff mill has changed hands, being now under the management of Col. Wall. The Barbee and Walker mines are looking well and the owners expect to bring in a mill soon. The Leeds company is working as successfully as usual. At the Pinkham mine the west shaft is down 85 feet, and are expecting to strike ore at every foot that is made in depth. As soon as ore is struck the mine will be worked vigorously. There is no reason why this mine in three months from this date should not divide the honors with the Leeds company. The town of Silver Reef is being improved fast, probably beyond its necessities. The mill being built on the edge of the town has given an impetus to business generally. The whole outlook of the Leeds district is cheerful and encouraging.

THE BIGGEST NUGGET.—Who found the biggest chunk of gold ever raised in California? is a question sometimes asked. John J. Finney, one of the old Shasta county pioneers, now residing near French Gulch, uncovered in the early mining times of California, about 10 miles from Downieville, in Sierra county, a chunk of solid gold that weighed 5,120 ounces, but not being compact it was broken in taking out. This is probably the best day's work ever done by a single miner. Like nearly all the old miners who have handled fortunes, John is still prospecting for the hidden wealth.—*Reading Independent*.

MECHANICAL PROGRESS.

Wedging Down Coal.

Workers in Pacific coast coal mines may be interested to read of a new process which is being employed in mining bituminous coal in England. *Seward's Coal Trade Journal*, in giving an account of recent trials, says: A half-inch hydraulic ram worked by hand, was used, this being connected by means of wrought iron tubing with the cylinder, in which a portion of the wedge was inserted, and the cylinder, four inches in diameter, and 11½ inches in length, was bolted to the clips of the wedge by two bars, constructed so as to allow the cylinder being moved to its original position when the wedge had been forced to the full extent of the stroke. The first experiment was in a "strait" placed on the end of the coal, 10 feet wide, the coal being cut on the higher side. The hole was placed on the lower side, and was three feet six inches deep, and the coal was holed a distance of nearly four feet. The wedges were placed in the drill hole, and in 17 minutes, 4½ of which were occupied in fixing and refixing the wedge and clips, the coal was successfully brought down. The weight of the coal dislodged was nearly four tons, and a very small proportion of this was slack. The second experiment was also on the end of the coal, this time with a side loose on the higher side. The length of the block was 12 feet, this being holed four feet. The drill hole was again three feet six inches deep, and was placed on the lower side. In 7½ minutes after inserting the wedge, the coal was brought down, forcing it off clear to the back of the holing on the higher side and leaving some six inches on the lower side. The cylinder had to be moved once, and this occupied 2½ minutes, so that force was only applied 4½ minutes. Between seven and eight tons were estimated to have been got by this one wedge, and very little of it was slack or even small coal. This third attempt was more to see whether, with the assistance of the wedge, side cutting could be entirely done away with, or if this could not be attained, what labor would be saved by first using a wedge. A place was selected in the face of the coal, 18 feet 6 inches long, and this was holed four feet deep. Drill holes three feet six inches in depth were put in on both ends, and the wedge was first used in the one on the right-hand side. After being forced a distance of two feet, the side, although the coal was not forced off, was so shattered that a collier was enabled to cut it out and cut the side in 26 minutes, the time generally taken to this work being two hours more.

WHY A BELT RUNS ON THE HIGHER PULLEY.—This problem is explained by J. H. Cooper in his new book on "The use of Belting" as follows: "That end of the belt which is towards the larger end of the cone is more rapidly drawn than the other edge; in consequence of this the advancing part of the belt is thrown in the direction of the larger part of the cone, which obliquity of advance towards the cone must lead the belt on its higher part. It may here be observed that this very provision—the rounding of the face of the pulley—which keeps the belt in its place so long as the machinery is in proper action, tends to throw it off whenever the resistance becomes so great as to cause a slipping. To maintain a belt in position on a pulley, it is necessary to have the advancing part in the plane of the wheel's rotation."

PHOSPHOR-BRONZE.—We read in a report of the English Polytechnic Society's fair, that the Phosphor-Bronze Company obtained a first-class silver medal for a large collection of exhibits illustrating the various uses to which this invaluable alloy can be put. Phosphor-bronze is a compound of tin, copper and phosphorus in certain proportions, according to the special work required. Among the exhibits were several bearings that had been in constant use for long periods without appreciable injury, and a plunger that had been in operation 572 days without giving any evidence that it had been in wear at all. Few better illustrations of the wear-resisting properties of phosphor-bronze could have been afforded.

STANDARD MEASURES OF LENGTH.—The Justices of Lancashire, carrying out a recommendation of the Board of Trade, says *Iron*, have caused to be erected at Manchester, a low platform of masonry, on which is supported the measures for testing the following lengths, according to the fixed standard—100 feet divided into 10 lengths of 10 feet; a chain of 66 feet divided into links; 1 foot, 2 feet and 1 yard divided into inches and parts of inches. This has been most useful, and large numbers of builders, surveyors, artisans, etc., constantly avail themselves of this opportunity of adjusting their measures according to the certified standard of mural lengths.

CASE-HARDENING.—*Polytechnic Review*: In case-hardening iron to a considerable depth, the unhardened portion is weakened by crystallization. This difficulty may be completely remedied by first hardening as usual, then annealing the articles the same as if of steel, in which operation the iron will assume its original fibrous structure; then harden, and, if required, temper the same as steel.

A SUN STOVE.—An East Indian newspaper, the *Times*, says: The other day a trial was made of Mr. Adams' patent solar cooking apparatus; the result was pronounced to be highly satisfactory. At 11 o'clock in the forenoon the apparatus was set placed in the open air as to receive the solar rays, and about every half hour its inclination was changed by a touch of the hand. About 4 o'clock in the afternoon the apparatus was removed from the spot, placed in a room, and covered with a railway rug. At 8 p. m., when the cover and the rug were removed, the contents (several pounds of mutton and some vegetables) were found thoroughly cooked. The apparatus, we may state, consisted of a copper vessel tinned inside and painted black outside, with a glass cover enveloping the vessel with an inch of hot air. The solar rays, passing through the glass, we are told, became transformed into obscure heat, which the glass retained. The vessel was fixed on the bottom of a conical reflector lined with common silvered sheet glass, and was 21 inches square at its large base and eight inches at its small base. Mr. Adams has made another apparatus of greater simplicity than the one experimented upon, which, by means of solar rays, and in the open air, can cook chops and steaks as well and as expeditiously as over a coal or coke fire. A very important point is that the heat can be retained as long as three hours and a half, and perhaps longer. Mr. Adams hopes soon to be able, under more favorable circumstances than at present, by means of an apparatus constructed on the same principle, and by a combination of flat reflectors, to concentrate solar rays to such a degree as to work wonders in science yet undreamt of.

TO STRAIGHTEN WARPED WOODS.—Of all the trials and vexations that beset the beginner there are none more annoying than this tendency of his wood to warp. He sends to his dealer for a small assortment of fine woods, and expects to receive them perfectly true and flat. Perhaps the woods are flat when they leave the dealer, but in transit they are very likely to twist out of shape, reaching their destination badly warped. The expressman may not be aware of the subtle nature of these woods, and in not a very gentle manner lays the package on a damp, cold floor. The dry wood sucks in the moisture on one side, swells and curls. It should not be a difficult matter to cure this. If the wood is in a large piece the convex or hollow side should be steamed or moistened a little, and then laid upon a dry floor, holding it down with a smooth, flat board, upon which weights are placed. When quite dry it will be found to have regained its original shape. If the wood is in small pieces it can be easily straightened by gently steaming the convex side over a teakettle, and then holding the other side towards the heat until it becomes straight, when it can be left in a press or under weights for a few hours. Almost any warped woods will yield under this treatment.

SOLDER AS AN AID TO CHUCKING.—Prof. Sweet in his last talk on lathe working in the *Polytechnic Review* gives the following hint: Very few machinists appreciate the advantages gained by the use of a little solder. Often irregular pieces can be soldered to a block or casting, and chucked easily; and after finishing, a little heat melts it loose. I have seen various straps, bolts and clamps put around the two halves of a brass box to hold them for boring out, when the application of a little solder would have held them together like a solid box. It is well enough to remember that if you have a piece of work which you can neither chuck on the lathe nor hold in the vise, to solder it to a piece you can hold. In setting work in a four-jawed chuck, much time is saved in adjusting it first in one direction, that is by adjusting the first and third screws, entirely disregarding the other two; then when the piece is true in one direction, turn to the second and fourth screws and adjust those in like manner.

RAILROAD TIES.—A recent lumberman's circular estimates the number of railroad ties in present use in the United States at 150,000,000. A cut of 200 ties to the acre is above rather than under the average, and it therefore has required the product of 750,000 acres of well timbered land to furnish the supply. Railroad ties last about five years; consequently 30,000,000 ties are used annually for repairs, taking the timber from 150,000 acres. The manufacture of rolling stock disposes of the entire yield of 350,000 acres, and full supply of near 500,000 acres more, every year. It appears, then, that our railroads are stripping the country at the rate of 1,000,000 acres per annum; and their demands are rapidly increasing.

HISTORY.—The *American Manufacturer* says: The first foundry in Pittsburgh was erected in 1803, on the site now occupied by the postoffice. Its products at first were pots, kettles, and other domestic utensils, but in a few years it was called upon to make cannon-balls for the government, and in 1811-12, the first cannon made west of the Allegheny mountains was cast at this foundry, the establishment being thereafter kept busy furnishing cannon and shot till the close of the war in 1814.

CARBOLIC ACID ON METAL-CUTTING TOOLS.—The *Papier Zeitung* mentions that a Herr J. Ashby strongly recommends the use of carboic acid for moistening the tools with which metals are worked. The duty of the grindstone is even said to be increased by the use of the acid. The dark and impure acid can be used for this purpose.

SCIENTIFIC PROGRESS.

Abundance of Life in the Arctic Seas.

It is a popular error that the cold of the Arctic seas is unfavorable to fish life. "In truth," says Prof. Hind, "the Arctic seas and the great currents flowing from them are in many places a living mass, a vast ocean of living slime, and the all-pervading life which exists there affords the true solution of the problem which has so often presented itself to those engaged in the great fisheries—where the food comes from which gives sustenance to the countless millions of fish which swarm on the Labrador, on the coast of Newfoundland and in the Dominion and United States waters, or wherever the Arctic current exerts an active influence." In the Arctic seas the waters are characterized by a variety of colors; and it is found that if a fine insect net be towed after a ship it becomes covered with a film of green in green water and a film of brown in the brown water. These films are of organic origin. "It is a living slime, and where it abounds there are also to be found swarms of minute crustaceans, which feed on the slime, and in their turn become the food of larger animals." Dr. Brown has shown that the presence of this slime, spread over 100,000 square miles, provides food for myriads of birds that frequent the Arctic seas in summer, and also furnishes sustenance for the larger marine animals, up to the giant whale. "During the recent voyage of the *Valerius* to Disco, Dr. J. Gwyn Jeffreys, when between 200 and 300 miles east of Cape Farewell, caught with the towing net some floating masses of pulpy greenish matter, which was found to consist of a vast assemblage of diatoms, each individual being about the tenth of an inch in length. This diatom was subsequently found to have a very wide range, and to extend over some thousands of square miles." These contribute to the support of the smaller marine animals, and these in turn to higher forms.

This "slime of the ocean" appears to live abundantly in the coldest water and in the neighborhood of ice. The great ice drift coming from the Spitzbergen seas, sweeping round Cape Farewell, then northwesterly to Davis' straits, is augmented by immense bergs and flocs from Baffin's bay and Hudson's straits, and at length, on the banks of Labrador, countless thousands of these ground, bringing with them their "slime." Thus the "slime" which accompanies the icebergs and ice flocs of the Arctic current accumulates on the banks of northern Labrador, and renders the existence possible there of all those forms of marine life—from the diatom to the minute crustacean—and from the minute crustacean to the crab and prawn, together with molluscan animals and starfish, in vast profusion—which contribute to the support of the great schools of cod, which also find their home there.

DRAINING THE GERMAN SPRINGS.—Much excitement has been created at Ems, in Germany, the most famous of Continental watering places, by the threatened destruction of the baths which are its main dependence. The mining companies working in that neighborhood are undermining the springs. The mines formerly supplied lead and silver only, but since the extension of the manufacture of steel, the gangue rock—which is a carbonate of iron—has become more important than the other parts of the ore. The fact seems to be that the increased activity given to the operations by this new source of profit has led to excavations to a depth which may really interfere with the natural water courses of the region. Such a result is by no means new in mining, for, frequently, wells and springs dry up when the shafts near them are sunk to a great depth. Sometimes the mine is the sufferer from this mishap, as was the case with the famous Rammelsberg copper mine. The discovery of a very rich vein in one portion of the workings was followed by the drying up of the wells in Goslar, a town of 10,000 inhabitants, situated two or three miles from the Rammelsberg shafts. The managers were obliged to wall up their rich stores and forego the benefit of working them. At Ems an investigation has been ordered, but as yet the result has not been reported, so that, for the present, it cannot be determined whether the baths or the mines are to be the sufferers.

A JAPANESE DIRECTORY.—Prof. Edward S. Morse, now of the University of Japan, in lecturing about the Japanese in Cambridge, the other evening, praised their diet of grasshoppers as extremely palatable. He described the city directory of Tokio as a much more poetical volume than people are accustomed to think directories can be; it contains, besides the names of streets and business places, the localities of pleasant walks about the city, with directions where "sweet singing insects" can be heard, the best place to see fireflies and tinted foliage, etc.

THE SYCAMORE OF PALESTINE.—The sycamore of Scripture, it may be observed, is a species of fig. The English sycamore, a maple, and our sycamore, the buttonwood, being so called from the resemblance of their leaves to the old-time fig. It was at one time thought, from carvings, that the orange grew in Egypt; but the representations are now proved to be the fruit of this sycamore fig.

The Future of America.

Rev. Joseph Cook recently delivered a lecture in New York City on "Ultimate America." Of our continent's field for progress in the future he said:

It is not commonly known that the amount of arable soil in North and South America is greater than that in Europe, Asia and Africa put together, and can therefore sustain more lives. This is no rash conclusion. I speak from a scientific basis. The remnant of productive soil (as the scholars say, I do not assert it on my own authority), is 10,000,000 square miles in the Old World, and 11,000,000 in the New. Thus bursts upon us in all the light of scientific truth the fact that America can sustain a greater population than the Old World, and if she can, it is unquestionable that she some day will. In this circumstance I hear the echoes of fate, with whose footfalls it is fitting that the centuries should keep step. Some of us who are not yet very old have seen our population increase from 27,000,000 to 40,000,000. Some have seen it increase from 8,000,000 to 40,000,000.

Suppose that there are 100,000,000 persons in all America in the year 2000. This is surely a moderate estimate, for now there are 84,000,000. Suppose that after this year 2000 our increase is one per cent. a year, or less than the present increase in England and Germany. It is said that the imagination is audacious, but this reason is more so. On this basis what do we find the future of America to be? Its population in the year 2600 would be 6,400,000,000. The *Encyclopedia Britannica* affirms that North and South America can furnish sustenance for 3,600,000,000. Europe has an average population of 80 persons to the square mile. We have an area of 15,000,000 square miles. If we conclude (and why may we not?) that we shall some day have as large an average, our population will be 1,200,000,000. Before such a stupendous future we should remember that America has been twice washed in blood because past generations have been poor rudders. In this view of the case, the age has, therefore, not ceased to be a crisis.

The Microscope in the Laboratory.

In a late issue of the *Chemical News* Dr. P. Townsend Austen, of the New York School of Mines, says: In chemical research the microscope always plays an important part in revealing the presence of crystalline substances in solutions. The usual method of preparing substances for examination by the microscope when, as in the laboratory, fine microscopes, animalcules, cages, and other conveniences are not at hand, is to evaporate some of the solution on a watch-glass over a micro-chemical gas-flame, and then rub with a glass rod, when the crystals begin to grow on the minute scratches in the glass, and thus set up a general crystallization. The crystals formed in this manner, however, are rarely satisfactory, being often broken, misformed or mixed with a large amount of the substance in a partially amorphous state.

If the solution be evaporated to the right consistency in a watch-glass, and another watch-glass of the same size, previously warmed, be placed upon it, the drop expands to a film. This upper glass should not be pressed, but allowed to rest of itself. The film is similar to the one obtained in an animalcule cage, being, however, thicker. If now a few drops of ether be placed in the upper watch-glass, the cold caused by the evaporation of the ether will cause a crystallization to take place between the watch-glasses. The growth of the crystals can be quite accurately managed by increasing or diminishing the cold on the surface, by blowing on the ether.

The crystals formed are, as a rule, perfect in shape. I have, by these means, obtained well-defined crystals from solutions, which, by rubbing with glass rods, afforded me only amorphous powders.

NEW ELEMENTS.—At a meeting of the chemical section of the New York Academy of Sciences, held December 10th, an important letter from Prof. G. A. Koenig, of the University of Pennsylvania, was read, in which he makes the following communication: "I am engaged, and have been for a considerable time past, in a study of titanium. The investigation is one absorbing much time, and the progress is very slow. My results hitherto obtained convince me that TiO₂ is capable of being separated into compounds yielding different reactions, and hence that titanium must be considered as composed of two metals at least, but I think three. The trimorphism of TiO₂ led me into this investigation, and will find finally its explanation in the above sense. I am unwilling, however, to publish partial results."

A NEW ARCTIC EXPEDITION.—A whaling steamship, the *Vega*, has been bought for the Swedish Arctic expedition, which is to start next July from Gothenburg. The vessel is very strongly built, and can carry coal enough for a cruise of 8,000 miles; she is to be supplied with sufficient provisions to serve for three years. Capt. Palander will be in command; less than 30 persons will be on board, in all; three or four will constitute the scientific corps. The King of Sweden, the Government, Oscar Dickson, of Gothenburg, and Mr. Sibiriakoff (a Russian), conjointly defray the expenses. The projected voyage will circumnavigate both Asia and Europe.

We shall for the present print our "Mining Summary" in type a size larger than we have been accustomed. In order to give the same amount of reading matter, we shall transfer the "Mining Shareholders' Directory," mining stock tables, etc., to the twelfth page weekly, leaving the entire fourth and fifth pages of each edition for the "Mining Summary," where our readers may look for it hereafter.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

AMADOR.

THE MOORE MINE.—Amador Independent Jan. 5: Work at this mine is progressing rapidly under the management of Messrs. Hill and Hewitt. The shaft has been opened and re-timbered down about 75 feet—to the water's edge. There is supposed to be about 100 feet of water in the shaft, and hydraulic hoisting works are being constructed for the purpose of hoisting the water out, which will be in operation in the course of a few days.

HYDRAULIC MINE ON HUMBURG HILL.—We learn that Mr. James Meehan and others are making preparations for working their hydraulic claim on Humburg hill, near the Kennedy mine, on an extensive scale.

A NEW DITCH.—Messrs. Payne & Co., proprietors of the large gravel claim near Moon's ranch, are engaged in cutting a branch ditch from the Amador canal to their claim, for the purpose of obtaining water sufficient to work on a more extensive scale. The ditch will be about three miles in length, and capable of carrying 1,000 inches of water.

DRY TOWN.—The Pennsylvania mill is fast approaching completion, and they will probably be ready in another week to commence crushing. The new steam hoisting works are being pushed ahead as fast as possible, and everything looks favorable for an energetic working of the mine.

The ten-stamp mill of Mr. John A. Davis, about one mile up the creek from here, is completed, and only waiting for water.

The Crown Point M. Co. are about to sink a new shaft, when it is believed they will find considerably richer rock than they have yet worked.

The Bonanza is now being worked by some of the creditors of the company.

I UNDERSTAND the Mexicans and Austrians have been getting very rich pay out of the "Black Hills," as it is called here, or the Loyal Lead claim; but their lease will expire on the 21st of February next, when the property will revert to the owners, the Loyal Lead G. M. Co.

The scarcity of water makes times a little dull here just at present.

PLYMOUTH.—Cor. Amador Ledger, Jan. 5: Quartz mining on claims prospected last summer has been suspended until spring, although I hear that the Central mine, on the ranch of R. H. Duncan, between the forks of the Cosumnes, is to be pushed through the winter. Hunter & Co.'s mine, near the Central, was sold, some months back, to a San Francisco company, but they have suspended work for the present. In the spring we anticipate that work will be revived on all these claims.

CALAVERAS.

WATER FAILED.—Calaveras Chronicle, Jan. 5: The water in the ditch is reduced to its minimum. In fact, it has failed almost entirely. There was not to exceed 40 inches Wednesday, and all the claims—even the Gwin mine—have had to suspend operations in consequence. The cold weather has solidified the aqueous fluid in the river above here.

GOLDEN QUEEN. owned and superintended by John P. Spaulding, Esq., has struck it rich. This is one of the finest prospects in the district.

At the Hortense, Lewis & Fairchild are still extracting the precious, and will soon have a crushing that will astonish all. This mine is located in Specimen gulch.

INYO.

BULLION SHIPMENTS.—Coso Mining News, Jan. 5: On the 31st ult. the Emigrant M. Co. shipped 135 pounds of silver bullion, valued at \$1,500. The total shipments of this company, as given in at Wells, Fargo & Co.'s office here, for the month of December last, were \$11,250. There was also shipped, by prospectors, gold bullion valued at \$600. As the mill of the Sheldon M. Co., at Snow's canyon, is running successfully, we expect to be able to record some very good shipments of gold bullion during the present month. Considering the fact that the Emigrant Co. has had but five stamps running only 12 hours each day—in consequence of the inadequate supply of water—we think the members of the company may congratulate themselves for the success they have met with. In less practical hands than those of Mr. Peter Taylor, Superintendent, and Mr. Smith, amalgamator, we presume we would not have had the pleasure of writing this article.

LEE DISTRICT.—Lee is coming to the front as a business place, all from the success made by the Emigrant M. Co. We predict that, when the company shall have removed their mill up to the mines and brought the water in, Lee will assume the proportions of the best camp in the county. Other mines will be worked and more mills put in operation.

NEVADA.

ABOUT READY.—Nevada Transcript, Jan. 4: The Pioneer Reduction Co. will be ready for work next week. The mill and sulphuret works will be ready to start up about the same time. A large lot of rock which is being taken out of George Smith's mine will be crushed there.

BULLION.—Grass Valley Union, Jan. 9: The Bullion Co. started up its new batteries of eight additional stamps yesterday. This makes 18 stamps in all at the Bullion mill, and will enable them, at least for the present, to crush the ores of both the Bullion and the Alaska mines.

The South Yuba Canal Co., the North Bloomfield Gravel M. Co., and the Milton M. and Water Co. paid their taxes, some \$20,000, on Monday, to the County Treasurer, under protest. This will cause a looking up of the money until the matter is decided by litigation. Although these companies pay a large tax, it is the general belief of those familiar with the properties that they are not assessed at a high figure, and a suit at law will demonstrate the fact. The protesting companies may embarrass the county for a time by tying up this money, but it is not likely to prove a saving of money to them in the end.

PLACER.

DIVINE MINING ITEMS.—Dutch Flat Forum, Jan. 3: From Mr. A. Wilson, of Forest Hill, who has been visiting Auburn, this week, we learn that at the Centennial mine, near Todd's Valley, work is being pushed ahead vigorously and the gravel is paying well. Pond & Constable, of Todd's Valley, have their hydraulic mines all fitted up in fine condition for washing and are only waiting for rain enough to fill the ditches. They fired off a big blast recently that did excellent execution. The Big Spring claim, near Forest Hill, run by the May boys is fitted up for hydraulic, but in the absence of water as yet the parties are drifting away, determined if they can't get hold one way they will have it another. The Dardanelles, in the Forest Hill district, have completed their extensive and expensive season's repairs to both mines and ditches and have considerable ground blasted. With plenty of water this company will make things lively. The Green Spring, east of the Dardanelles, W. Jones, Superintendent, is fitted up for hydraulic, but, like the other hydraulic mines, is waiting for water. At the Hope mine, run by Barlow & Phillips, they are drifting and it is understood are doing well. Reamer is prospecting and fitting up the Baltimore for future operations. The Jersey, a drift claim, owned by a Welsh company, is now doing well. They have been troubled some with bad air in the past, but this difficulty being overcome, they are now in a fair way to make things count. Harry Adams & Co. and Cranage & Co., both big claim owners at Smith's Point, are, owing to the scarcity of water, preparing to work their claims by the drift process. Trafton & Hodge, at Yankee Jim's, are sinking on their newly-discovered quartz ledge, the Badger. They prospect the claim thoroughly.

PLUMAS.

IMPORTANT MINING STRIKE.—Plumas National, Jan. 5: The workmen in the Summit mine, above Spanish ranch, struck gravel one day last week. Work on the tunnel has been in operation for several months, and it has been run into the mountain some 700 feet, the last 200 in pipe clay. When the tunnel struck through the rim it was, of course, known to be too high, but was run ahead, we suppose, in the hope of striking the raise of the bedrock. After going about 200 feet in the clay it was decided that the better plan was to sink a shaft from the tunnel, and at the depth of 33 feet blue gravel was found which prospects well. The channel is a very large one and this is the first time it has ever been prospected. Numerous breaks from it have been worked and paid richly. Probably all the gold in the Silver creek country came from it. The Summit company will have to be at the expense of a new tunnel, but as they have now a certainty of good pay when they get in, there will be no trouble in getting the capital required for the work. We consider this one of the most important discoveries made in Plumas, as it demonstrates that this channel, which can be traced for miles, is a rich one, and there is no doubt but that profitable work will be made for hundreds of men, and a brisk mining camp spring up which will last for many years to come.

ITEMS.—The Blackhawk company have their flume nearly completed. The Plumas National mine, on Soda creek, is paying steadily and well. The mill yields about \$180 per day, besides saving a ton of sulphurets for future working. The owners are well satisfied with the prospects, and well they may be. The rock in the Green Mountain mine has improved considerably in the developments in the past few weeks. We hear that J. McVey has recently sold his Silver creek claims to Taylor & Co. The Wisconsin company have recently added five stamps to their mill, and now have 15 stamps at work. The rock is paying first-rate. A rich strike is reported in the lower level of the Gold Stripe mine.

SIERRA.

SHORT.—Mountain Messenger, Jan. 5: The force of workmen is very small in the Bald Mountain mine, owing to want of water to wash dirt. Their dumps are all full.

NORTH FORK.—The North Fork tunnel is nearly in to pay gravel. The rock, which gave them so much trouble, is reported to have stopped swelling.

NEXT year the waters of Big canyon will be brought in through the mountain to La Porte, when five new mines will be opened there.

BRUSH CREEK.—The Brush Creek mine is reported to have developed a larger ledge than ever before found of the richest kind of rock. The prospects are brilliant for an extensive and permanent mine.

STRUCK IT.—The owners of a quartz ledge near the Pliocene mine, have found rich quartz in their tunnel. They are in, perhaps, 30 or 35 feet only. The ledge is the same that crosses the South Fork just below Jenkin's bridge.

RICH FIND.—A three and one-half ounce nugget, almost solid gold, was picked up, the other day, at Little Grizzly. Dr. L. W. French took it to Los Angeles, where the members of the company, who recently bonded Bunker Hill mine, reside.

MORRISTOWN.—One foot and a half of snow fell here during the recent storm. The hydraulic mines only need the encouraging stimulus of a little water to yield as fruitfully as ever. J. H. Thomas, of La Porte, has acquired by purchase most of the mining ground hereabouts, and next spring will bring in water for working the extensive hydraulic property at Craig's Flat. It is also his intention to start a mill and open a store at this point.

EUREKA.—Everybody here prepared for work when water comes. Tom Baird is now as well if not better fixed for a vigorous campaign on his hydraulic claim than any other in the State. He has one 30 and one 25-inch pipe, capable of feeding four monitors, all ready for water season. F. Blake and B. F. Folsom are out on bedrock, working with water from the French ditch. Thatcher & Parks are well fixed with pipes down the hill and monitors set. Jack Hardy, Chaparral hill, has rich gravel in both gangways. Henry Baker, Wm. Frank and others still take out pay dirt, expecting water daily for a bonanza clean-up. Scott & Crooks, of the old Clamper diggings, are prepared for work.

TRINITY.

MORE QUARTZ.—Trinity Journal, Jan. 5: Mr. C. M. Ritter, of Lewistown, writes us that he anticipates furnishing the Journal with an interesting item from Eastman's gulch, about the 1st of February. A company, of which he is a member, have been taking out quartz from a ledge in that locality and now have a lot of good rock ready for crushing. An arastra has also been erected and crushing will commence as soon as the freezing weather is over. The boys look for big results.

RICH RETURNS.—Messrs. Belleau & Trotter had a "Happy New Year" in reality after cleaning their arastra at the Deadwood quartz mines. From 16½ tons of quartz milled they realized about \$3,700, besides leaving gold in the arastra estimated at from \$500 to \$1,000 more. This shows an average of over \$230 per ton, and Mr. Belleau informs us that they have plenty more quartz equally as good at the dump. The cold weather has dried up the water, but the company will keep at work getting out quartz, and when they complete the tunnel they are now driving, they will have all three of their quartz veins tapped and commence breasting out on each of them. The length of the tunnel now being run will be about 500 feet and it will strike the veins at a good depth for working to advantage. Prospecting is being carried on in the other claims and the present indications are that Deadwood will become a lively mining camp once more.

Nevada.

WASHOE DISTRICT.

CALIFORNIA.—Gold-Hill News, Jan. 9: Daily yield, 650 tons of ore. The bullion yield of the ore crushed during the month of December was \$1,635,892—which leaves a nice little surplus on hand after paying all expenses and the usual monthly dividend of \$1,080,000. The ore stops on the 1500, 1600 and 1650-ft levels are yielding rich ore, and show well at every point. On the 1650-ft level the north drift in the ore vein is steadily advancing, the face in rich ore. No work of value is being done on the 1700-ft level at present.

CON. VIRGINIA.—Daily yield, 550 tons of ore. The ore stops in every portion of the mine are looking splendidly, and yielding the usual rich character of ore. The bullion yield for 25 days' run of the mills for the month of December was \$1,552,994, from which the usual monthly dividend of \$1,080,000 has been declared. The mills are all running and crushing ore up to their full capacities. A few days since a story to the effect that the Brunswick mill, on the Carson river, had shut down, gained credence; but this is not the fact, as that mill is running and crushing regularly its 100 tons of ore per day. On the 1750-ft level crosscut No. 3 is still advancing, the face in porphyry. The ore in the face of the north drift from No. 3 crosscut is very rich, assaying as high as \$200 per ton, with every appearance of the widening and improving of the ore body to the northward.

LADY WASHINGTON.—The main drift south at the 850-ft level, to connect with the Justice, is making good progress, and continues in low grade ore.

WARD.—Sinking the shaft is going vigorously forward. It is now down 1,010 feet.

OPHIR.—The south drift on the 1900-ft level east of the ore vein is steadily advancing, the face in vein porphyry. No crosscutting has been attempted. The joint Mexican winze on the north line will connect in a very few days with the west crosscut from the north drift on

the 1900-ft level. Everything working well at all points above and below ground.

YELLOW JACKET.—The main east drift on the 2200-ft level is out 698 feet; face still in hard porphyry. The north drift on the same level, towards the Imperial, is in 488 feet, and connected with the south winze of the Imperial last Sunday. The stone masons at work on the foundations for the pump engine and machinery are rapidly drawing their labors to a close.

SILVER HILL.—The east drift on the 800-ft level is steadily approaching the ore vein, with the most favorable features for the development of a solid concentration of the ore and quartz on that level. The southeast drift on the 600-ft level is still in ore and quartz.

NORTH CON. VIRGINIA.—The east and west drifts on the 1350-ft level are both being advanced rapidly to cut and prospect the ore vein. It will not be long now before another station will be opened and new drifts will be again started to open the mine at a still greater depth.

SIERRA NEVADA.—The south drift on the 1500-ft level has reached the Union Con. line, where a winze is being sunk to connect with the north drift from the Mexican.

MEXICAN.—No work is being done on the 1600-ft level, pending the connecting of the north drift in Union Con. with the Sierra Nevada mine. As soon as that is completed, and air obtained, crosscutting and prospecting this level will be resumed.

CHOLLAR-POTOSI.—The connection between the east drift on the 1785-ft level and the west drift from the combination shaft, was completed on Saturday last, and a strong current of good air obtained. This will give a fine chance for crosscutting and developing the ore vein on this level.

JULIA CON.—Sinking the main incline is going ahead as rapidly as the nature of the work and difficulties of hoisting by band will permit. The foundations of the new hoisting engine at the 1800-ft station are completed and the engine is expected on the ground in a day or two more.

JUSTICE.—The dumps are all full of ore, and a new roadway is being constructed by which a considerable saving will be effected in delivering it at the Pacific mill, which will be started up in a day or two more. The ore stopes on the 1150-ft level are showing splendidly as they are being opened ready for the extraction of ore. The south prospecting drifts on this level are looking much more favorable. The 1300-ft station is being opened in the main incline.

UNION CON.—The north drift on the 1600-ft level has very nearly reached the north line of the mine, at which point an upraise will be made to connect with the winze now being sunk below the 1500-ft level south drift of the Sierra Nevada for air purposes.

UTAH.—The north drift on the 1350-ft level is steadily advancing and is now in a distance of 185 feet. The east crosscut on the 1150-ft level is making the best of headway, the face in lively vein matter.

ALTA.—The winze in the ore vein below the 1050-ft level was connected during the week with the north drift on the 1150-ft level of the Justice, giving a good circulation of air, and proving the Justice ledge and that of the Alta to be the same almost beyond a doubt. The west drift on the 1150-ft level day before yesterday struck the ore vein, developing \$15 to \$20 ore, which is improving as the drift is advanced.

BULLION.—Sinking the main incline below the 1700-ft level is going steadily forward without change of value to record. Sinking the double winze below the 1840-ft level is also making good progress.

OVERMAN.—The double winze below the 1400-ft level is being sunk with all the speed possible, the bottom still in favorable ledge matter.

BEST & BELCHER.—Sinking the donkey winze below the 1700-ft level has been stopped on account of the great quantity of water encountered, until the Gould & Curry shaft can be connected with the 1900-ft level and the pumps placed so as to take the water.

GOULD & CURRY.—Sinking the main incline is going vigorously forward. It is now about 45 feet below the 1800-ft level. The flow of water continues quite strong. The foundations for a large air compressor are about completed.

CON. IMPERIAL.—The south drift from the bottom of the south winze, on the 2400-ft level connected with the north drift of the Yellow Jacket during the week, giving a fine circulation of air. This connection will now enable the commencement of the development of the ledge in that portion of the mine.

SUTRO TUNNEL.—Very good advancement is being made with the header. It is running in regular Comstock vein matter, and has just passed through a streak of quartz and porphyry 20 feet wide, from which several pretty good assays were obtained. Total length of tunnel last evening, 18,679 feet.

CROWN POINT.—Daily yield, 60 tons of ore, from the old upper workings. There is no material change in any of the upper workings or in the prospecting drifts on the 2000-ft level. The yield of bullion for December was \$41,697.

NEW YORK.—The shaft is down 97 feet below the 800-ft station, and sinking in very favorable looking material, with frequent streaks of fine looking quartz coming in, indicating something better very shortly.

TROJAN.—Owing to the legal trouble induced by the suit of an employee for wages, work was stopped day before yesterday, but this difficulty was very soon arranged and work is resumed again.

HALE & NORCROSS.—The pumps are kept

steadily running, and with the aid of the water tanks in use at the Savage mine, are gradually gaining on the flow of water, which is now 42 feet below the 2000-ft level.

LEVATHAN.—The incline is now down 53 feet below the 600-ft level and in good working ground. It is sinking at the rate of 2½ feet each 24 hours, and passing through streaks of quartz that look finely and give low assays.

SENATOR.—This mine having passed into new management arrangements are now being made for working and developing it through the Sutor tunnel, which is fast approaching it and will pass immediately through it, and at a depth of 1600 feet or more.

SAVAGE.—The new V boh for the pump is being manufactured at the Gold Hill Foundry, and will be placed in position in the mine in a very few days.

SUCCESS.—The shaft is making good sinking progress, and the very favorable material mentioned in last week's report continues to be passed through.

BALTIMORE AND AMERICAN FLAT.—The north drift on the 1400-ft level is showing some very favorable quartz with streaks of ore.

SOLID SILVER.—The work of retimbering the main tunnel is making very good progress, and crosscutting and stoping out ore will be commenced next week.

ELY DISTRICT.

ASSESSMENT WORK.—Pioche Record, Jan. 5: Some of our claim owners are not going to lose their claims for the want of money with which to do the requisite amount of work, as on Wednesday last some Indians were placed on one claim so as to prevent it being jumped. Of course Indians cannot do much in the mining line, but still they can be made to do enough assessment work to prevent any trouble until the owners can get enough surplus cash to pay miners' wages.

DAY.—The south drift continues in very rich ore. The discovery cut continues to improve both as regards quantity and quality. From indications in the south drift, as well as in the discovery cut, both the ore bodies seem about to unite, confirming the experts theory of the formation.

HILLSIDE.—From Eugene Blair, Superintendent of this mine, we learn that they have run down on the ledge a distance of about 35 feet, and have cut through the ledge in several places, in which it is three feet in width. The ore assays well and the ledge is looking nicely.

GREAT EASTERN.—The work of straightening the shaft is finished and ways being put in. A whim is being erected preparatory to taking out ore.

BAY STATE.—Repairs to shaft are completed and are sinking with three shifts. The whole bottom of the incline is in good ore.

ALPS.—From the eighth and ninth levels considerable ore of good quality is being extracted, and as work progresses there is considerable improvement in size of vein and quality of ore. Stope between 10th and 11th is producing a much better quality of ore and in larger quantities during the last week, as the ledge has increased in width and carries a larger percentage of high-grade ore. The mill is running regularly on ore from the mine.

MAYFLOWER.—The road is completed to the mine and are making one from the ore dump to the main road. The work of exploration has been commenced at the bottom of the incline, without any material change, except in lowering the incline they struck what appears to be the top of a body of rich chlorite.

EUREKA DISTRICT.

WATER IN THE EUREKA CON.—Eureka Sentinel, Jan. 6: A rumor was in circulation yesterday morning that the bulkhead on the ninth level of the Eureka Con. had given away. On investigation we learned that the bulkhead put in over a year ago had sprung a leak, and considerable more water than usual was seeping through, but not in enough quantities to retard work. It is probable that a new one will be put in of sufficient strength to keep back the flow until such time as it may become necessary to put pumping machinery in the shaft.

Six cars of crude hullion were shipped to Palisade yesterday, valued at \$18,000.

SOME rich developments are being made at the Hoosac mine.

The lead production of the Richmond refinery is retained at the works, none being shipped at present.

The Eureka Con. and Richmond companies paid off their miners yesterday.

The main shaft at the Rescue mine, Silverado, is down 450 feet, and will be carried a farther depth of 50 feet. The mine is looking splendid.

The cost of refining crude hullion at the Richmond works averages \$13 per ton, which is as low a figure as obtains in the Eastern refineries.

Arizona.

THE LEE.—Arizona Citizen, Jan. 4: Supt. Scott is in town from the R. E. Lee mine, and says the last shot in the east drift, just before he left, threw out some very good ore, but nothing yet to make a noise about. He is confident, however, that his energetic labors will be rewarded soon, and he will be able to place the Lee on the list of dividend-paying mines. We also learn from him that the shaft on the Hannible is now down about 50 feet in good ore. They have water in the bottom of the shaft, which is a good indication of a true fissure vein.

We are reliably informed that the McMillen

company now have about \$80,000 worth of ore ready for shipment, and about \$60,000 worth of milling ore on the dump, awaiting the arrival of new machinery from New Mexico.

GLOBE DISTRICT.—This is my first visit to the extreme northern section of Globe district. The enterprise and progress of McMillen camp has been described to me many times, and yet I must say I was quite surprised to find such a large settlement here. The McMillen hill, so far as developed, is certainly the silver wonder of the world. The entire hill seems to be a network of threads and spurs leading into the main ledge. Before the present company took hold of this mine several bodies of very rich ore were taken from the opposite side of the hill from where the main shaft and tunnel is located; this main shaft is now down about 100 feet, and the tunnel is run northeast and southwest nearly 300 feet. Ore from the immensely rich strata is hoisted daily from the main shaft, and the extent of this strata can only be determined by further developments. The Hannible mine is the first northeast extension of the McMillen claim. Charlie McMillen, the original discoverer, has a shaft down about 30 feet in ice-looking ore, and the indications promise a rich strike soon. Very rich pockets of ore have been taken from the Little Mc, and the Doctor, and they are, without doubt, very valuable claims.

MIAMI CITY is situated five miles below Globe City, where the south branch meets the main bed of Final creek. As yet there are but few buildings here, but it is by no means an insignificant locality. Townsend's new 10-stamp mill has just been completed here, and is a handsome and imposing structure, and as good a mill as ever was shipped from San Francisco. It combines an ore-crusher, heating apparatus, 10 stamps, four furnaces, four Wheeler pans, two large settlers, a retort and several other minor and convenient appliances, all of which unite in the perfection of the mechanism and capacity of the mill. The mill is only awaiting the arrival of some water-pipe and a superintendent. The engine was started a few days since and the entire machinery worked as smoothly as though it had just been stopped to oil. The company intend to begin on ore from their mine, the Miami, a large quantity of the ore is now ready for the crusher, and teams are constantly plying between the mine and the mill. Outside of the Miami ore the mill will be kept running on custom work. This is something that has long been needed in this district. A great many miners have good prospects from which they have taken many tons of good ore, but they have no capital to assist in further development, and no market for their ores.

Idaho.

BLACK JACK.—Owyhee Avalanche, Jan. 5: Reports from the Black Jack mine still continue to be most favorable. At a depth of 110 feet the ledge has all the characteristics of an enormous bonanza and is growing better and better. Out of about 700 tons of rock taken from the mine during the past few weeks, less than 10 tons were put aside as unsuitable for crushing. Bullion to the value of \$7,759 has been shipped to San Francisco within the past few days.

GOLDEN CHARIOT.—At the Golden Chariot work is progressing favorably in the crosscut on the 15th level.

The Illinois Central is looking well and there is the usual force at work there.

ARRANGEMENTS will soon be made to start up the War Eagle.

WAGONTOWN.—From Wagontown the reports are quite encouraging. Mr. Walls and others have recommenced work on the Webfoot, which is undoubtedly one of the best mines in the country. The Jones mill is crushing rock from some of the other mines in the vicinity.

The ledge worked by St. Clair & Newcomb is steadily improving and there is every indication that the Ruth will turn out to be a first-class bonanza. The ledge is well defined and the pay streak unusually rich in gold.

GLENBROOK.—The Glenbrook is looking well and it is the impression of all who have inspected the ledge that it will yield a fortune to its owners, Messrs. Simondi & Martin. The pay streak is about 18 inches wide, and as the work progresses it looks better and better.

NEW COMPANY.—Idaho World, Jan. 4: A company composed of heavy capitalists in the East has been organized to operate in mining. The agent is expected here in a few days to examine the different quartz mines of the Basin.

The Golden Era mine, situated on Summit flat, is looking better than ever before. The ore is very rich and decomposed, and can be extracted very easily. The proprietors intend erecting two arastras to work it early in the spring.

Montana.

BULLION SHIPMENTS.—Butte Miner, Dec. 29: As only two of the Butte mills, the Walker Bros' and the Lexington, have been running during the past week, the bullion shipment for the past seven days has been unusually light. From the 17th to the 24th inst., there was shipped by Wells, Fargo & Co.'s express from Butte 1,161 pounds of bullion, valued at \$19,084.54. The Dexter and Burlington will both be at work after the first prox., when we shall probably have more flattering bullion reports to make.

BOILER ABANDONED.—The large boiler shipped some time ago from Salt Lake City, and intended for the pumping machinery of the Alice mine, has been abandoned on the other side of the Pleasant valley range, and there is now but little prospect of its arriving at its des-

tination before next May or June. This is very much to be regretted. It was the intention of the managers of the mine to prospect the ledge at a much greater depth than has yet been reached as soon as machinery of the necessary power was at hand, and as a boiler of sufficient size alone is lacking, the failure of the contractor to deliver his freight at Walkerville this fall practically arrests the development of the leading mine of Butte for four or five months, at least. The Messrs. Walker Bros. are very anxious to have it brought forward this winter, and have offered 10 cents freight to anyone who would convey it from the point of its abandonment to Walkerville.

News in Brief.

TICE POPE continues to improve in health. The Pottsville Bank, Pennsylvania, has suspended.

GEN. JOHN O'NEILL, the noted Fenian leader, is dead.

GENERAL GRANT has arrived in Cairo, and has visited the Khedive.

The National Woman Suffrage Association is in session at Washington.

CHARLES M. NYE, son of the late Senator, is lecturing on temperance.

The Columbia river has been filled with ice during the past few days.

DON FRANCISCO DE LA GUERRA, a noted native Californian, is dead.

The St. Gothard tunnel is in about five and a half miles.

An octopus eight feet in length was found at Hunter's Point Dry Dock a few days ago.

In New England, on Monday morning the thermometer marked from 24 to 42 degrees below zero.

The U. S. Supreme Court has rejected the famous McGarrahan claim.

The late Nathan Coombs, of Napa, left property valued at \$363,750, to be divided equally among his five children.

The garroting epidemic is becoming alarming in San Francisco. Robberies are being committed even in the day-time.

NINETY-NINE new buildings were erected at Rio Vista during last year, at an estimated cost of \$46,740.

The big California ship *Three Brothers* has just arrived from Liverpool, making the passage in 112 days.

The difficulty between Spain and Hayti, regarding the threatened execution of a Spanish subject, has been amicably arranged.

KEARNEY, Knight, Wellock and Helm have been indicted by the grand jury for riot and conspiracy, but were released on bail.

The absurd report comes from Paris, that Bonanza Mackay is to become Count di Mackay by purchasing an Italian earldom.

The Pennsylvania Supreme Court has affirmed the sentence of death passed on Molly Maguire Hexter, Tully, McCune and Kehoe.

The attachment against the Collinsville Fish Cannery, owned by Emerson Corville, has been released, and its original owners have taken possession again.

COL. SHAFER, before the sub-committee on military affairs, testified that there was less stealing on the Texas border during the past year than in any former year.

On Tuesday 14 tons of bullion were received from the California and Consolidated Virginia mines. This is one of the heaviest shipments received in this city for some time.

AUGUSTUS HEMMERWAY, of the class of '75 of Harvard College, has given that institution sufficient money to erect a new gymnasium, that will accommodate 300 persons.

A WASHINGTON special says the Cabinet has agreed to recommend a popular loan, and the President will send a message to Congress at once, asking for legislation upon the subject.

HICKOX & SPEAR, bankers of this city have made an assignment for the benefit of their creditors. The assets, including personal property of the firm, slightly exceed the liabilities.

This week has been marked by heavy bankruptcies, in Chicago especially, but also in the North and West; bad roads, poor collections, and a decline in real estate being the prime cause.

The report of the Commissioners of Immigration shows that the total number of aliens which arrived at New York last year was 54,536, a decrease of 16,129, compared with the previous year.

The new tug built by order of the Harbor Commissioners has been launched, and is now at Harrison street, receiving her boilers and machinery. She has been named the *Governor Irwin*, and will soon be ready for service.

A St. PETERSBURG dispatch says that hopes of an armistice are rapidly disappearing. The strictest secrecy is maintained as to the terms Russia would propose. It is said that even the Commander-in-Chief has not yet been instructed on this point.

LEUT. WISE and his party of explorers returned to Panama from the examination of the Bayano. The examination of this route has tended to confirm the report of Commander Selfridge, that a tunnel over seven miles long would be necessary in opening the Isthmus canal at that point.

A MINER on the Comstock was killed in a horrible manner this week. He was holding a piece of wood against a two-inch steam auger running 1,000 revolutions a minute. The auger came through the stick suddenly and heing self feeding pulled the man right on, went through the entire body, and killed him.

VICTOR EMANUEL, the king of Italy, died on Tuesday.

KEENE says he is \$2,500,000 ahead of Wall street.

It is estimated that 1,593 houses were erected in San Francisco last year.

The number of deaths in Chicago during 1877 was 8,026, or 546 less than in 1876.

The total number of hodies thus far recovered from the ruins of the candy factory in New York is 15.

A NEW fraud upon the Indians has been discovered connected with the sale of their surplus produce.

SEVERAL vessels were driven ashore and foundered in a gale on the Massachusetts coast last Friday night.

SUPERVISOR GIBBS, of this city, has been acquitted of the trivial charges of misappropriation of election funds.

The Oakland Transcript has changed hands. Mr. Johnson, of Santa Barbara, has purchased the entire establishment.

MILTON S. LATRAM has resigned the Presidency of the London and San Francisco Bank, on account of ill health.

At the East there has been an unusual fall of rain, and the prayer has been for a change to old-fashioned cold weather.

The telephone has been tried between Dover and Calais with perfect satisfaction to the inspectors of submarine cable.

The British government embargoed 2,000 cases of cartridges on board a steamer at Cardiff, destined for Constantinople.

It is said that Victoria and New Tacoma will be the termini of the Pacific Mail Steamship north coast service in a short time.

SECRETARY SHERMAN has instructed Collector Fulton to go on with the sale of property abandoned at the Centennial exhibition.

It is again reported that James Gordon Bennett is about to establish a daily paper in London, to be called the London Herald.

The Great Western market, on Bush street, in a building formerly used as a stable by the Sutter Street R. R. Co., has been opened.

The Kickapoo Indians in Mexico, formerly our "wards," are now asking to be allowed to return to the United States, as Mexico is too hot for them.

INTERNAL revenue receipts for December fell off \$448,000. The cause is thought to be the agitation in Congress to reduce taxes on whisky and tobacco.

It is stated that President Diaz has signified the desire of Mexico to resume diplomatic relations with France and participate in the approaching exhibition.

ETTINGER, who wrecked a Baltimore and Ohio train during the July strike, killing two persons, has been found guilty of murder in the second degree and sentenced to 18 years imprisonment.

PROBABLY an order will soon be issued from the Treasury Department for uniforming Custom House employees, though it will depend somewhat on experiments yet to be made in one or two principal offices.

On the 7th inst. four vessels cleared from New Orleans for Liverpool, loaded with cotton, amounting to 25,000 bales, valued at \$1,500,000, the largest shipment ever made in one day from any Southern port.

GOVERNOR CONNER offers the fact that there has been but one conviction in Maine for murder since the abolition of the death penalty, in refutation of the argument that a carnival of crime would follow such abolition.

The Official Gazette of London announces the creation of the Imperial Order of the Crown of India, for ladies only. The order has been conferred on all the Princesses, eight Indian Highnesses, and 18 other persons of distinction.

The grand jury suggests that, as diphtheria is as contagious and as fatal as small pox, a law should be enacted which makes it a penal offense to send children to school out of a family infected with diphtheria. There was in this city 912 deaths last year from this disease.

The Aldermen's Committee for the investigation of New York ring frauds have finished a report. It seems that of thirty millions stolen \$876,000 has been recovered. The committee recommended the prosecution of those who have not given up their stealings, including Oakley Hall.

MR. SWIFT has in the Assembly a bill to prevent the destruction of shrimps and small fish, such as are known to be the usual food for salmon and large fish. His plan is to stop the taking of these small fish to dry them, as is now practiced by the Chinese fishermen, and also to stop the drying of such fish.

It is stated that President Hayes has definitely determined to make the Chinese question the subject of a special message to Congress. In this message he will call attention to present and prospective evils of unlimited Chinese immigration to this country, and will recommend Congress to take such action as in its wisdom may be most proper and effective to restrict and regulate the immigration of Mongolians.

The Supervisors, on Monday evening, on motion of Mr. Hill, adopted the following resolution: *Resolved*, That this Board is opposed to and deprecates any action being taken by the Legislature of this State to compel the employment of any designated number of men at the charge and expense of the taxpayers of this city and county, and hereby respectfully request that all legislative action taken in reference to the relief of unemployed workmen in this city and county shall vest the number to be employed and the manner of their employment in the discretion of this Board.

THE ENGINEER.

A Valuable Map Completed.

A map showing the plans of the primary triangulation of the past season has just been completed by A. D. Wilson, Chief Topographer of Prof. Hayden's geological survey, and will soon appear. The area covered by these triangles extends from Fort Steele, in Wyoming Territory, westward as far as Ogden, in Utah, a distance of about 260 miles, and north as far as Fremont's Peak, in the Wind River range of the Rocky mountains, and includes the Grand Teton, near the Yellowstone National Park, embracing about 25,000 miles. Within this area 26 primary stations have been occupied and their positions computed, so that they are accurately placed on the chart by latitude and longitude. In addition a large number of mountain peaks have been well located, which are to be occupied as points from which the topographical work of the survey will be extended in the future. This work was commenced near Rawlin's Springs, on the line of the Union Pacific railroad, where a base line was carefully measured. From this base the work was extended north and west to the valley of the Bear river, Idaho Territory, where a check base was measured and the work expanded to the mountain peaks to connect with the work as brought forward from the former base. This work has been connected along the line of the Union Pacific railroad at six points with Clarence King's 40th parallel survey. In addition to the importance of this sheet as the base work of this season's topographical work, it presents a most striking feature in the number of remarkably long sights which have been made from the summits of some of the most lofty mountains within the area explored by the survey, many of them being over 100 miles, while some of them reach a distance of 135 miles. From Wind River Peak all the principal points in the Big Horn mountains were sighted, also the lofty peaks of the Uintah mountains—the former located 165 miles to the northeast, while the latter range is situated about the same distance to the northwest, but as these ranges are not within the scope of the present season's work, they will not be given in this chart. This map presents the evidence of a most successful year's field work, when it will be remembered that each primary point is about 14,000 feet high, and as the long air line sights indicate that some of them are from 100 to 165 miles apart, and to travel these distances and climb all points located, shows an extraordinary amount of both scientific and physical exertion, all of which has been most successfully and satisfactorily accomplished.

DE LESSEPS ON THE DARIEN SHIP CANAL.—At a recent meeting of the Paris Academy of Sciences, a paper was read by M. De Lesseps, in which some further particulars are given of the proposed canal across the Isthmus of Darien. The line advocated by Lesseps, starting from the Pacific coast, ascends, in the first place, the river Tuira as far as the Island of Piriaque or Alligators' island. From this point a straight cutting, 16,200 meters long, connects Tuira with Chucunaque near the point where the Tupisa flows into this latter river. The line then ascends the Chucunaque for 14,400 meters; then turning to the northeast, it continues up the valley of the Titi, to a point, where, for reasons of economy it would be preferable to make a tunnel rather than continue deep cutting. This tunnel passes to the south of the peak of Gandi, under the remarkable ridge from which on one side an arm of the Tuquesa, and the Titi flow down toward the Pacific, and on the other the Tolo and Acanti flow to the Atlantic. On emerging from the tunnel the canal continues through an open cutting about ten kilometers long, down the valleys of Acanti and Tolo to the deep waters of port Candi. The probable length of the tunnel is estimated at between 13 and 14 kilometers, and the cost of making the whole canal at 600,000,000 francs.

PERUVIAN RAILWAYS.—The work on the Oroya railway, and that of Cerro de Pasco, together with the drainage of those famous mines, is about to receive a decided impulse in order to arrive at its termination as speedily as possible. The government has at last acceded to the desire of Messrs. Olyphant & Co., relative to the manner in which the stipulated subsidy is to be paid, and a decree is published to the effect that the amount of the subsidy for the first year will be handed over to the representatives of the house in nitrate of soda, at the market price. The first annual subvention is to be paid in three instalments at intervals of four months from October last, on which date the decree referred to was signed.

THE NEW BRIDGE AT ASHTABULA.—Recently Chief Engineer Clark and other officers of the Lake Shore and Michigan Southern railway went to Ashtabula to test the new bridge that had just been completed by the Keystone Bridge Company, of Pittsburgh. This bridge is a Pratt truss and composed of the best iron. The many engineers and practical mechanics who have examined it pronounce it one of the most substantial on the continent, the cost being \$30,000. The test of the bridge consisted in placing six engines upon it at a time, and from these, which weighed in the aggregate more than 390 tons, there was not the least indication of strain. The officers were well pleased with the result of the experiment.

Plants of Tube Wells.

At a recent meeting of the English Society of Engineers, a paper was read by Mr. Robert Sutcliffe, on "Tube Wells for large supplies and in various strata." Mr. Sutcliffe, in his opening remarks, observed that in laying down plant for obtaining large supplies of water, a number of tube wells were coupled together by horizontal mains, so that one pumping engine drew from many tubes. In this way, for the last eight or nine years, the leading breweries at Burton-on-Trent have obtained the bulk of their water supplies. Messrs. Allsop & Sons pump 600,000 gallons daily from 30 three-inch wells, and Messrs Bass & Co. 500,000 gallons from 25 tubes. Thus in one town two breweries are obtaining sufficient water for a town of 40,000 inhabitants. Although some of these Burton wells are within a stone's throw from the Trent, the quality, level and temperature of the water differ from those of the river water. The town of Carmarthen, in Wales, is supplied by 10 two-inch tube wells. In sandy soils strainers or filters are used, which prevent sand coming into the tubes. A tube well was sunk in a very fine sand at Chiselhurst, by pumping up six harrow loads of sand and replacing it with gravel. One advantage of the gravel filter is its imperishability, and if made sufficiently large the velocity of the water is not sufficient to bring the grains of sand within the area acted upon by

ing sands, and the violence of the tidal wave, will be avoided. The canal will consist of a single section of about 17 miles in length, the western outlet of which will be in the Eure dock, at Havre. According to the plans adopted, the canal would have a minimum breadth of 25 meters (over 80 feet), with a towing path six meters wide on each bank. Plans have been adopted for increasing the depth of the channel of the Seine between Paris and Rouen to three meters 20 (10½ feet); a minimum of three meters 50 has, consequently, been fixed for the canal; and as between Havre and Harfleur it is to be accessible for brigs, schooners and steam colliers, the depth in that portion will be increased to four and one-half meters. The cost of the work is estimated at 21,000,000 francs, including all accessory works, the planting of the banks with trees, the construction of a branch, 500 meters long, to connect the port of Harfleur with the canal, and a basin of 500 meters by 60 meters at Havre.

Scientific Smelters.

A great many people sneer at what they call scientific smelting, and claim that no one is competent to take charge of a furnace except a man who has been educated at the front, and has done all the work from feeding to wheeling slag-pots. No doubt but this knowledge is of

Rainfalls Before and After January 1st.

We are indebted to Prof. G. F. Becker, of the Department of Mining and Metallurgy at the State University, for the interesting diagram on this page, showing the relation between the amount of rain falling before and after January 1st, in each year since 1849. The method which prevails in the plotting is described in a note from Prof. Becker, which we print below. It will be noticed that heretofore an average of two-fifths of the rain of the fiscal year has fallen before January 1st. While this would give us a rather light total rainfall this year, if it conformed to the average, it is also shown in the diagram that wide departures from this rule have occurred in single cases heretofore, and we trust may occur this year. The study of our rainfall is a practical one, and we are under obligations to all scientific observers who give us data for pursuing it. Prof. Becker's note in relation to the diagram is as follows:

EDDERS PRESS.—To what extent the rainfall before the first day of January is proportional to that of the whole season, is a frequent subject of discussion and is a matter of great practical importance to the State. When Mr. Tennent published his valuable figures on the subject in the *Bulletin* of a few nights since, it occurred to me that it would be interesting to give this relation of the partial rainfall to the total in a graphic form, and in such a manner that the general proportionality, if it existed, and the relations for each year, would be apparent at a glance.

I make the following division of the rainfall in each year:

Rainfall in San Francisco.*				
YEAR.	BEFORE JAN. 1.	AFTER JAN. 1.	TOTAL.	
1849-50.....	18.00	15.10	33.10	
1850-51.....	2.30	6.10	7.40	
1851-52.....	10.46	7.98	18.44	
1852-53.....	10.31	15.95	26.26	
1853-54.....	5.22	18.65	23.87	
1854-55.....	3.72	19.06	22.78	
1855-56.....	6.03	15.63	21.66	
1856-57.....	7.08	12.73	19.81	
1857-58.....	8.13	13.75	21.88	
1858-59.....	9.78	12.44	22.22	
1859-60.....	8.95	22.27	31.22	
1860-61.....	7.36	11.86	19.22	
1861-62.....	13.66	35.61	49.27	
1862-63.....	2.30	10.72	13.02	
1863-64.....	4.33	5.70	10.03	
1864-65.....	15.04	8.79	23.83	
1865-66.....	5.27	17.66	22.93	
1866-67.....	18.62	16.90	35.52	
1867-68.....	16.34	22.50	38.84	
1868-69.....	5.67	15.63	21.30	
1869-70.....	6.91	12.40	19.31	
1870-71.....	3.80	10.30	14.10	
1871-72.....	20.60	14.11	34.71	
1872-73.....	10.22	7.80	18.02	
1873-74.....	12.21	11.77	23.98	
1874-75.....	9.01	9.39	18.40	
1875-76.....	10.03	15.98	26.01	
1876-77.....	3.21	6.79	10.00	
Grand total.....	265.61	392.92	658.53	
Ratio.....	2	to	3	to 5.

*According to Tennent. Regent Davidson, nearly five years since, plotted Mr. Tennent's figures for the purpose of discussing the periodicity of the rainfall, but not in such a manner as to bring this special relation into prominence. In the accompanying diagrams each perpendicular line represents a winter from the year 1849, on. The horizontal lines represent inches of rain and the distance from the base or zero line, at which each curve crosses the vertical line appropriate to any year indicates the amount of rain which fell in San Francisco during that year. The three diagrams represent respectively the rainfall before the first of January, after the first of January, and the total rainfall. The scale of years is continuous and is the same for all the curves; the scale representing inches, on the other hand, is different for each and is inversely proportional to the amount of rain which has fallen during the period covered by the diagram. The consequence of this selection of scales will evidently be that if the amount of rain falling before the first of January were simply proportional to the total rainfall for the season, and if, in each year, just two-fifths of the rain came before January 1st, the three curves would be identical. Hence, their variation expresses exactly the limits within which this rule applies.

As your readers are interested in the weather, perhaps some of them may find this chart a convenient record of the past. G. F. BECKER.

University of California, Dec. 20th, 1877.

CHANCE OF DEATH BY TRAVEL.—It takes the French to get up statistics. One of their learned men, skilled in that line, has demonstrated the great improvement which has taken place in the safety of travel in modern times. He says that in the old diligence days a man had one chance of being killed in 300,000 trips and one chance of being injured in 30,000. On the railway, between 1835 and 1855, there was one chance of being killed in 2,000,000 journeys and one chance of being injured in 500,000. From 1855 to 1875, one chance of being killed in making 6,000,000 journeys and one chance of being injured in 600,000. Now the chances of being killed are as one to 45,000,000 and of being injured one to 1,000,000. Consequently, a person traveling 10 hours a day at the rate of 40 miles an hour, would, in the first period, have a chance of escaping destruction during 321 years, during the second period during 1,014 years, and between 1872 and 1875 during 7,439 years.

Vertical Scales Inversely Proportional to Grand Totals.

DIAGRAM SHOWING RAINFALL BEFORE AND AFTER JANUARY 1st.

the pump. The author observed that in rocks or other hard strata the method of sinking tube wells was similar to that employed in making artesian borings, but the mode of pumping and development of supply was entirely peculiar to the tube well system. Bored wells can be made through any stratum and to any depth that an ordinary artesian boring can reach. The Lower Grounds, Birmingham, with their ornamental waters, fountains, and extensive gardens, derive their entire water supply from a single five-inch well sunk to about 200 feet deep. By means of this well an annual saving of about £300 for water rate is effected. Two tube wells at West Thurrock yield a daily supply of of 220,000 gallons from the chalk. In conclusion, the author observed that it was said that the first tube well was a pointed bamboo driven into the earth, and the pump a "higger," who sucked the water through the pores of the cane. Now, said Mr. Sutcliffe, factories, breweries and towns derive from them enormous supplies, and it is possible that coupled tube wells in the chalk may solve the problem of providing London with pure water.

NEW FRENCH MARITIME CANAL.—Preliminary formalities are being carried through at Havre, France, for the construction of a maritime canal from that port, touching at Harfleur, and joining the Seine at Tancarville, a point on the river about 60 miles below Rouen. By means of this canal the dangers of the navigation of the lower Seine from fogs, the shift-

great utility, but there are many things necessary beside. The ore varies in its constituents, one hatch carrying a larger proportion of silica, another of iron, while a third may be impregnated with base metals of a refractory nature. Here it is where scientific training comes into play, and if united with practical knowledge so much the better. An instance of the truth of the above is shown at a certain furnace in Eureka. For the past year the profits have been nothing; in fact, the smelting operations have not paid expenses. Some two months ago a gentleman who united a scientific training with a practical knowledge of the work, took charge, and since that time, from the same ores, the excess of profits over expenses has reached the sum of \$20,000 per month. We know of several other instances of the same nature, and we only refer to the above as an illustration of the worth of science. If our ambitious smelters would devote their leisure hours to the acquirement of a knowledge of the chemical constituents of ores, their fluxes, etc., they would command not only higher positions but their services would become indispensable to the mine owners of the Base Range.—Eureka Sentinel.

THE State Savings Bank at Indianapolis has obtained authority from the Auditor of State to surrender its charter and go into liquidation. The assets are sufficient to cover all liabilities. Twenty-five per cent. will be paid to depositors at once and the balance within six months.

Sapping Life and Strength.

In our opinion nearly all schemes to defraud people of their surplus savings become comparatively innocent beside the insidious crime of making money by the debasement and adulteration of human food. Swindling schemes to steal surpluses may produce almost indescribable disappointment, and in some cases actual bodily suffering, but the evil is small compared with that of day by day, and hour by hour, sapping the life and strength of the community by lessening the nutritive power of the foods upon which we rely to arm and nerve us for the burdens of life. He who in the place of bread sells us something as worthless as a stone and perhaps as dangerous as a scorpion, deserves a degree of punishment far weightier than he who steals our purse. It is an absolute need that the public should protect itself against the practices of rascally adulterators of food supplies whose work is becoming so general and so bold. We have urged before our convictions on this point and we can but reassert them, with increased force, now that the Legislature will soon have measures for the protection of the people's food before it for consideration. We are squarely and fully on the side of the people in this matter. The need seems apparent enough. Other countries and other States have passed enitable laws for examination of foods offered for sale, and the examinations which have been made by competent inspectors show that the extent of adulteration and the range of substances assailed by the debaser are far beyond anything which had been imagined. The methods of examination are plain enough, thanks to the progress of science. The test tubes of the chemist and the microscope, when in competent hands, give evidence such as the courts freely recognize, and when inspectors are competent and penalties severe, the remedy through the law is ample for the public protection.

We notice that there is now before the Legislature a proposition for the appointment of a salaried milk inspectorship in this city. The idea is an excellent one, providing it is honestly urged and the office is not created merely to give a salary to some one. We know very well from our own examination and analysis of the milk which is often offered for sale in this city that we have found many samples in which at least one-quarter was worthless foreign material. The yearly expense of maintaining an inspector could be saved each week at least, if he were a competent man whose testimony the courts would recognize; and an active man, whose presence in every place would strike terror to the hearts of the debaser. If these can be assured we should advise the creation of the office forthwith, not only for the strength of the city's men and women, but also to save the lives of thousands of children from the wretches who furnish them innutritious or unhealthy milk.

But not alone to the dweller in the city are safeguards against the adulteration of food material requisite. The tons of supplies which are taken to the country and form a part of rural cookery and table furnishing are all liable to the frauds of evil minded manufacturers. There should be some means of discriminating between the evil and the good, of punishing the evil and transferring patronage to the good. We are glad to see that the State Board of Health has brought up this topic anew in this year's report, and we trust their recommendations will be heeded by the law makers. In the report we find an article by Dr. J. F. Montgomery, of Sacramento. Among other things the writer makes the following note of articles in which adulterations are practiced:

Of the foods, some of the articles recently mentioned as being most frequently adulterated, are tea with sand, powdered quartz, Prussian blue, exhausted and decayed tea leaves, as well as other leaves or husks, and various other substances, many of them injurious to health; coffee, to the extent of from 30% to 80% of chicory, besides powdered beans and many other ingredients; bread, with alum, to conceal the had quality of flour to an extent to damage health, and also, in some instances, with marble dust and other impurities, to cheapen its production or manufacture; butter, with foreign fats, some of them of vegetable origin, from 50% to 85%, and some samples without any butter at all, and milk with water from 20% to 50%, and deficient besides; in cream or butter fat.

The condiments, too, as a general rule, are more or less adulterated. Mustard, for instance, is very frequently adulterated, mainly with corn, wheat and rye flour, and turmeric, sometimes to the extent, in the aggregate, of 90% of impurities.

Of drinks, the alcoholic, vinous, and fermented are all very much adulterated, or tampered with in some way. Some specimens of whisky have been found to contain a sufficiently large quantity of fusel oil to render it liable to produce insanity, among other injurious effects. Then, again, some specimens, besides other poisonous ingredients, contain sufficient quantities of sulphuric acid to cause serious damage to the stomach and to the system generally. Some of these specimens, indeed, had barely a trace of real whisky. Wines are notoriously adulterated or mixed, apparently with the sole view of enriching the manufacturer or dealer, with-

out any regard to the effect the pernicious compounds may have on the health of those who may partake of them.

Nor are drugs or medicines allowed to escape the polluting touch and the vile manipulation of the dishonest adulterator, although, upon their purity and efficacy the life of the sick and suffering often depends, and without the purest quality of which the most skillful physician is often thwarted in his efforts to minister to the needs of the afflicted, and is thus rendered powerless.

USEFUL INFORMATION.

GRANULATION.—The process of reduction by granulation is adapted to the metallic substances. The metals are acted upon by being fused in a crucible, and then pouring the melted matter from an elevation very gradually into cold water, which must be kept constantly agitated by stirring. The fineness of the resultant granules is proportioned to the slowness with which the fused metal is poured into the water. Iron is brought to a powdered state, mechanically by the file, and chemically by reduction in an atmosphere of hydrogen gas. The noble metals, in a state of foil may be pulverized by rubbing up with honey, when the addition of boiling water solves out the medium without action upon the metallic powder, which then only requires to be thrown upon a filter and dried. Phosphorus may be divided by fusing it with alcohol over a water bath, and shaking the contents of the flask until thoroughly cooled. The phosphorus subsides at the bottom in pulverized form.

Gum camphor, which is obstinate under the pestle, readily yields when a few drops of alcohol or ether are added, which destroy its elasticity. Silver is obtained in powder by the decomposition of its nitric solution with a metallic copper rod, or of its chloride by metallic zinc. Potassium of iron throws down gold in a finely divided state from the solution of its chloride, and spongy platinum is formed by the dull ignition of the ammonia-chloride of that metal. The process of sublimation which we have already treated of, shows instances of chemico-mechanical division, the vaporized particles being prevented from reunion at the moment of solidification, by the intervention of cold air.

ATTACHING WAGES.—Judge Stowe, of Pittsburgh, has announced a new rule of practice governing the attachment of wages. The case was that of George Miller vs. George Rush, in which wages in the hands of Singer, Nimick & Co., garnishees, were attached. A rule was asked to show cause why the attachment should not be quashed. The Court says: "There is, perhaps, no other class of cases in which it is so necessary to adopt a summary proceeding as this. The law is that the laborer shall have his wages to live and support his family upon, without being liable to have them seized in execution for his debts, and courts should, as far as possible, see that this object is secured and the law so administered as best to reach the result intended. To allow wages to be attached, and then compel the laborer to wait for months, and perhaps for years, to get a trial before a jury on facts which are not disputed, is clearly wrong, and undoubtedly should not be permitted if it can be avoided. We think the court has a right to and can establish a practice to secure the end proposed, without infringing the right of trial by jury. We have, therefore, come to the conclusion that hereafter when wages are attached, as in this case, we will quash the attachment as to them, permitting it to stand so far as other debts, if any not exempt, are concerned. But whenever the allegation that the debt attached is for wages, is properly traversed under oath, we will refuse to quash, and require the cause to go to a jury to determine all questions of facts involved."

REFUSING PASSAGE TO A DRUNKEN MAN.—In a recent case the Indiana Supreme Court holds: A railroad company is not bound to receive any person as a passenger who is drunk to such a degree as to be disgusting, offensive, disagreeable or annoying; and a person so drunk as to be likely to violate the common proprieties, civilities and decencies of life has no right to passage while in that condition. The comfort and convenience of passengers generally must be protected, their opinions and feelings regarded, and a proper decorum observed. Although in a railroad passenger car neither the highest breeding of the drawing-room nor the fastidious delicacy of the parlor is required, yet the behavior of all persons therein should be becoming the place and the general character of the passengers. Slight intoxication, such as would not be likely to seriously affect the conduct of the person intoxicated, would not be sufficient ground to refuse passage in a public car, although the persons behavior might not be in all respects strictly becoming.

TEMPERING THIN TOOLS.—To temper files, ratchets, etc., the best method is to heat them to a red heat, according to the nature and quality of the steel, on a small iron shovel, and to turn the piece on to a plate of steel or iron, which is at least a centimeter in thickness; then cover quickly with another plate of the same thickness. If the operation is well performed a very good tempering will be obtained.

DOSE FOR RATS.—A writer to the *Rural New Yorker* says: My method of ridding myself of rats in the cellar, or about the house, is to take a quantity of refined potash, (I use Babbit's) partially pulverize it, moisten it with water, so that it will form a sort of paste, and daub this about the bottoms of their holes and run-ways, so that they are compelled to step in it, in entering the premises. I have practiced this method for several years, with very satisfactory results. If the first application is not sufficient, it can, of course, be repeated with but little trouble or expense, and I am confident of favorable results. Such, at least, has uniformly been my experience since I first adopted the method, many years since. The theory is, the rats step in the moistened potash while entering. Its caustic nature produces a smarting sensation in the feet. He at once proceeds to lick his feet to alleviate the pain. The consequence is, a not-very agreeable sensation in the mouth. He is compelled to renew the application in going out—result, he does not care to renew his visit, and probably imparts good counsel to his associates, and the rat nuisance is at once abated. I prefer this method to the use of phosphorus, or any of the "rat poisons" recommended, as it is not always safe to have the latter around, and we have no dead rats left in the walls or other out-of-the-way places to infect the air with their offensive odors.

HOW TO CLEAN ENGRAVINGS.—A correspondent has recently succeeded in cleaning some engravings by the following process: Soak the print in cold water till all creases are out and it lies quite smooth; then put into a dish containing a solution of chloride of lime with twice its quantity of clear cold water. When the stains have disappeared, put the engraving into plain water, and afterwards dry with blotting-paper. For the solution referred to, put half a pound of chloride of lime into a vessel with one pint of water; let it stand, stirring it now and again, for 24 hours, and then strain it through fine muslin till quite clear, when the liquid is to be added to one quart of water. The prints should not be left in the solution longer than is necessary to remove the stains, and the more thoroughly they are washed in cold water afterwards the better for them; for, if any of the bleach is left in the paper, it is liable to rot and destroy it. The wet print requires care in handling.

CONTINUOUS OIL DISTILLATION.—The *Cleveland Leader* says: At the works of the Republic Refining Company, recently, Mr. H. C. Rose, President of the company, gave a very pleasant exhibition of his new process, which has attracted already considerable attention from the scientific press. The apparatus accomplished in six minutes what in the old way occupies twice as many hours, reducing 32 gravity crude to 26 gravity, and separating the various light oils instantaneously. The employment of the steam process in connection with the apparatus patented by Mr. Rose resulted in the quite extraordinary result of 26° oil of zero test. It is probable that in this apparatus we have in Cleveland a new and useful improvement in the methods of making lubricating oil from crude petroleum.

GOOD HEALTH.

The Pernicious Habit of Drinking.

An English physician, Dr. Duckworth, writes as follows: "Medical men may fairly tell the healthy, robust, well-fed and well-housed to give up stimulants if they fully maintain their health without them. Total abstinents are generally large eaters, and the ultimate textural effects of excess in eating or drinking, if any, may not be very dissimilar. I think it is proved that the addition of a little alcoholic food to a meal secures a more moderate ingestion of solids, and where it agrees, which it does not always, promotes a more satisfactory digestion of them. But a large number of persons suffering chiefly from dyspepsia or insomnia are better without stimulants of any kind. A daily allowance of alcohol is manifestly wrong; more to-day and less to-morrow may be needed or instinctively called for. The rational individual must honestly and conscientiously find out for himself what the special needs of his system are, and where a right-minded christian individual is in earnest in such a matter and has a proper control over his appetite, he is not likely to go far wrong in the matter of stimulants.

"Medical men should urge teetotalism upon the nervous classes of drunkards, persons who are careless and self-indulgent or who by their lives or callings are much in the way of drink. Stimulants should be always taken at meal times, and only then.

"I am confident that, as a body, our profession is unanimous in condemning the modern American habit of taking odd glasses of stimulants at all hours and lamenting the grievous multiplication of the means of gratifying this mischievous custom, for truly the conduct of masses of young business men in our cities and large towns in this respect is becoming disgraceful and the practice is fast gaining in other circles and communities. Our countrymen of these classes have no excuse for this, for they are well-fed and have liquors with their meals in addition to their hourly drinks, while Americans, who are notoriously the worst dietitians in the civilized world, are water-drinkers at meal time."

The Wholesomeness of the Orange.

Julia Colman, Superintendent of the New York cooking school, gives the *Phrenological Journal* the following: Not a few of those who wish to be careful as to the quality of their food have doubted the wholesomeness of the orange as it is found in the markets. A fruit, they have said, which is picked so green and kept so long can not be very desirable food. These queries, however, have mostly died away before the experimental proofs of its wholesomeness. Invalids and all sorts of well people eat of it freely without known ill effects. Many have gone to the other extreme and attributed to it health-giving properties, which they deem almost marvelous. For example, it is said to be a sort of insurance against disease to eat two oranges before breakfast for three months in the spring, say from March to May inclusive. We admit that such a course, if generally pursued, might turn many doctors out of employment.

Another prescribed use is to cure a longing for alcoholic drinks. The sufferer must eat an orange the first thing in the morning. We have faith in the remedy, so far as it goes, but to make it effective the subject must earnestly desire to give up the drink, he determined to do so, and then the orange will be a natural help to quench thirst, to aid in healing the stomach and to induce a wholesome tendency in the system generally. This much ought to be understood to prevent any one from supposing that it acts like a charm or philter to take away the unnatural craving. That will return again and again for some days, and if the subject understands this, instead of being discouraged, he will take another orange, and calling all the moral and social aid he can command to his help, he will be much more likely to succeed.

If in hot, unhealthy countries generally, men would eat an orange in place of drinking a glass of gin, brandy or other alcoholic liquor, the result would be most advantageous. And if some juicy fruit were eaten always in place of taking unwholesome water or any other drink whatever, the malaria of the worst localities might become almost harmless. If the water he wholesome, oranges or other fruit juice mingled with it make it very much more satisfactory, both in taste and results. If we took half the pains to provide ourselves with fruits that we do to provide ourselves with alcoholic drinks, we should soon see a beneficial change on the face of affairs.

EXPERIMENTS WITH THE TURKISH BATH.—Some interesting observations were related at the last meeting of the British Medical Association, by William James Fleming, M. B. (Glasgow). These experiments were performed by the author upon himself, and consisted of observations on the effect of the Turkish bath at temperatures of from 130° Fah. to 170° Fah., upon the weight, temperature, pulse, respiration and secretions. The results showed that the immersion of the body in hot, dry air, produced loss of weight to an extent considerably greater than normal, amounting, on the average, to the rate of about 40 ounces an hour. This was accompanied by an increase in the temperature of the body and a rise in the pulse rate, with at first a fall and then a rise in the rapidity of respiration. The amount of solids secreted by the kidneys was increased and coincidently the amount of urea. The sweat contained a quantity of solid matter in solution and among other things a considerable amount of urea. The most important effect of the bath was the stimulation of the emunctory action of the skin. By this means the tissues could, as it were, be washed by passing water through them from within out. The increased temperature and pulse rate pointed to the necessity of caution in the use of the bath when the circulatory system was diseased.

BORACIC ACID FOR SKIN DISEASES.—Surgeon Major Watson reports in the *India Medical Gazette*, that he has lately employed boracic acid with very great success as an external application in the treatment of dermatophyta, or vegetable parasitic diseases of the skin. He was, it appears, induced to try this remedy from witnessing its employment as an antiseptic in the Edinburgh infirmary wards. The diseases in which he has hitherto used boracic acid have been the various forms of tinea, especially that very troublesome form of the disease which affects the cranium and inner sides of the thighs of many Europeans in India. Dr. Watson declares that the external application of a solution of boracic acid acts like a charm in such cases. An aqueous solution of boracic acid of a drachm to the ounce, or as much as the water will take up at ordinary temperature, is employed. The affected parts, he says, should be well bathed with the solution twice daily, some little friction being used, and it should not be wiped off, but allowed to dry on the part. Altogether, he regards it as preferable to all other remedies of the same class.

AN AFRICAN RAILWAY.—In the United States Senate, on the 7th ult., Mr. Conkling (New York) presented a petition of Austin Packard and others, of New York, in favor of the appointment of a commission to communicate with other nations with a view of having a railroad across the continent of Africa.

A NUMBER of outside mines in Nevada have been jumped because the necessary amount of work was not done on them during the year 1877.

The Week.

We have been visited this week with another rain, which keeps alive the hope that we will still have plenty this year, and not have to stand the disastrous consequences of another dry season. News from the sections where the hydraulic mines are situated represents that they are nearly all tied up for want of water, and are anxiously waiting and expecting to start up work. In many places, also, quartz mills have had to bang up their stamps for lack of water. One good old-fashioned storm, which would reach all over the State, would be worth millions to us all. The news of the week from the seat of war indicates early peace, Russia having rather the best of it. Nothing very important has happened in mining circles, except the striking of ore in the Alta, and it is undecided yet whether the ground belongs to that company or the Justice. The honanza mines are sending out unusually large shipments of hulsion, which we sincerely hope they will keep up. More ore is beginning to come up from Arizona, most of it very rich. Next year this section of the country will have an opportunity to prove the abundance and richness of its mineral deposits, or it will disappoint its many friends.

Investment of Savings.

We see by the dispatches from Sacramento that there is some lobby opposition to the scheme of appointing a Bank Commissioner or any other plan which shall interfere with the present working of the savings banks. In the present state of feeling there is no doubt but that some plan must be devised to protect depositors in savings banks, and give them an opportunity of knowing what is done with their property. The people want the present system remedied, and it is probable that lobby opposition will be in vain. If no better guarantee can be given than the fact that the bank has offices, officers and a tray or so of coin on its counters, the people will soon give up having anything to do with savings banks and look for other places to put their money. A certain class of people have not time to look out for investing their savings, or the business knowledge necessary to do so. Accordingly they put them in savings banks. Unscrupulous men have taken advantage of their positions as managers of such institutions to walk off with the money entrusted to them and the depositors have no redress.

It remains with the representatives of the people to enact such laws as shall prevent any opportunity for stealing or making away with the depositors' money. No bank should be allowed to do business for two or three years right along without a representative of the depositors having a right to enquire how business was conducted. The failure to have such examinations made has resulted disastrously here and elsewhere and it remains with the Legislature to devise some plan for preventing the people from being swindled. We have some good banks and we have had some bad ones, but the depositor never knows the bank is bad until it is too late to get out his money.

The Government is becoming aware that the people desire a means of investing their savings where they will be perfectly safe, and we notice that at a Cabinet meeting, on the 8th inst., it was determined that the Secretary of the Treasury should, as soon as practicable, invite further subscriptions to a loan of 4% bonds, and so conduct it that all subscribers in all parts of the United States shall have a full and easy opportunity to subscribe to bonds of any amount authorized by law, through national banks and banks of established credit, and to give every facility allowed by law to convert postal orders, certificates of deposit, etc., and where necessary, sell coin to facilitate subscriptions, and to favor any legislation that Congress might see fit to adopt to promote the deposit of savings for the funding of the national debt.

Academy of Sciences.

The annual meeting of the California Academy of Sciences was held on Monday evening last. The election took place during the day, with the ordinary result: President, Prof. George Davidson; First Vice-President, Henry Edwards; Second Vice-President, Henry C. Hyde; Recording Secretary, Charles G. Yale; Corresponding Secretary, Dr. A. B. Stout; Treasurer, Elisha Brooks; Librarian, C. Troyer; Director of the Museum, W. G. W. Harford. Trustees: Gen. David D. Colton, Col. George E. Gray, Robert E. C. Stearns, Thomas P. Madden, Gen. John F. Miller, William Ashburner and Ralph C. Harrison.

Prof. Davidson was prevented by illness from attending the meeting, so no annual address was read. Mr. Henry Edwards occupied the chair.

The following was read by the Secretary: "The Council of the Academy have unanimously agreed, in exercising the privilege granted them by the Constitution, of nominating for honorary life-membership at the annual meeting such persons as have performed valuable services to the Academy, to present the name of Prof. George Davidson."

The nomination was unanimously endorsed by the Academy.

The report of Mr. Troyer, Librarian, showed that the additions to the library for the year numbered 600, including 365 foreign works.

Henry Edwards read a report of the Botanical Section, of which he is President, showing its work for nine months. The section comprises nine regular and two corresponding members. Their list embraces 536 species and 1,300 specimens of the flora of California and neighboring States. The work of this section has been prosecuted vigorously and effectively, and proves the soundness of the policy which seeks to sectionize the work of the Academy.

The report of the Recording Secretary, Mr. Yale, shows that the Academy gained nine resident members during the year and three life members. Sixteen members were dropped from the rolls for non-payment of dues and five resigned. The present membership consists of 82 life members and 268 resident members, making a total of 350 members. The average attendance has been 20 members.

W. G. W. Harford, Director of the Museum, read a report giving details connected with the various departments under his supervision. Dr. Kellogg, Curator of Botany, also read a report. Owing to some still unsettled financial matters, no report of the Board of Trustees was read, but will be presented at the next meeting.

Annual Expenditures on Claims.

There have been a good many claims jumped during the past 10 days in the different mining camps on this coast. They were not exactly "jumped," either, in the old acceptance of the term, for they have been re-located according to law, the rights of original miners having been forfeited for non-compliance with the provisions of the United States statutes, requiring an annual expenditure. There is no doubt but that the plan works well. Under the old system, unless the local laws provided for certain annual work, a man could locate a claim and let it lie idle for an indefinite length of time, so if anything near it developed into a good mine, this claim also would be worth something. The system was poor, because it tied up a lot of ground which the owner would not and others could not work. Now a locator has got to show his intention of doing something with his claim or the law gives it to some other man.

True, the expenditure required is comparatively small, but it is nevertheless large enough to make people drop a good many claims every year. A man owning a dozen or so claims on different parts of the coast finds the tax a burdensome one, perhaps; but still he ought to be made to develop such claims or give them up to some one who will. The law prevents, practically, one man holding too many claims, and is really better for the working miners than any before framed. The real practical miner or prospector, who intends doing something with his claim, can easily do enough work to hold it, while the speculator in claims must expend hard cash to cover the required expenditure. The law prevents any dog-in-the-manger speculator from holding on to 20 or 30 different claims without spending any money, and thereby keeping the practical miner, who would work them, away from the ground.

Taken altogether, the provision requiring annual expenditures on mining claims is a very good one for the mining interests of the country, although it may occasionally work a temporary hardship to deserving individuals. If a man cannot spend \$100 a year in keeping a mine, it is not probable that he will do much to develop it, and it should as soon as possible fall into the hands of those who will utilize the ground.

DEATH OF SENATOR PORTER.—The Hon. Nathan Porter, State Senator for Alameda county, died suddenly at Sacramento on Sunday. Senator Porter was well and favorably known throughout the State. He arrived in California in 1854. He was a law partner of the Hon. E. D. Sawyer for several years, and was at one time District Attorney in this city. He was also a law partner of Samuel Holladay for a number of years. He was a prominent Odd Fellow, having taken all the degrees, and represented California in the Grand Lodge of the United States for the past two years. He was an able orator, a ready debater, a fine criminal lawyer, a good citizen and a conscientious and upright man, and leaves a legion of friends to mourn his loss. The Senate and Assembly both adopted appropriate resolutions and adjourned over, out of respect to his memory. Resolutions were also adopted by the San Francisco Bar, and the courts adjourned on the announcement of the death. The funeral obsequies in this city on Wednesday were conducted by the Odd Fellows and were very impressive. Deputations from various lodges, members of the Legislature and the Bar attended the funeral.

THE NEVADA BANK.—The fourth semi-annual statement of the Nevada Bank, in compliance with the State law, has been published. The gross assets of the statement amount to \$19,708,400. The cash on hand is \$4,178,600, and bullion \$318,600. In addition to cash and bullion, the other assets at the close of 1877, consisted of \$6,962,600 for bills discounted at San Francisco, \$740,000 for bills discounted at Virginia, \$3,725,400 for advances against bullion, \$2,644,800, for United States bonds, \$1,000,000 in real estate, and \$138,400 in sundry accounts. Six months ago the bank had \$3,047,500 in United States bonds, against \$2,498,000 a year ago. The amount in real estate is the same as it was a year ago. The Nevada Bank was established October 4th, 1875, with a paid up capital of \$5,000,000. At the end of the first year of its existence the capital was doubled, Flood & O'Brien drawing a check for the additional \$5,000,000. The paid up capital is \$10,000,000. Of this Flood, O'Brien, Fair and Mackey, have each 23,750 shares valued at \$2,375,000 for each lot, and Louis McLane has 5,000 shares, valued at \$500,000. The bank has the largest paid up capital of any in the United States. The current deposit account on December 29th was \$5,770,100 for the city, and \$1,000,000 for Virginia City, or \$6,770,100 as a total.

The report of the Superintendent of the Life Saving Service shows that there have been, during the year, 134 disasters to vessels within the limits of the operations of the service. On board those vessels there were just 1,500 persons. The estimated value of the vessels was \$2,000,000, and of the cargoes \$1,500,000. The number of lives saved was 1,461, and lost, 39. The amount of property saved was \$1,750,000 and the amount lost was \$1,500,000.

The Necessity for a Physical Survey of California.

[Read before the Academy of Sciences by Prof. Ozo. Davidson.]

The subject matter of the few remarks which I shall offer for your consideration this evening is not strictly new to you. On more than one occasion this Academy has expressed its views upon the necessity for a thorough and exhaustive survey of this State, and not only of the State, but of the States and Territories adjacent thereto.

Whatever has been partially done has its value and its usefulness; but it is now a necessity that a more comprehensive system should be inaugurated, which will embrace every field of enterprise and investment.

I do not propound this necessity from theoretical or abstruse considerations, but upon the plainest, strongest demands of utilitarianism. Do not misunderstand me as ignoring science in such a work, on the contrary it is only upon the clearest deductions of observation and research, conducted by scientific methods, that the greatest gains and advances can be made in everyday practical life. When the practical man raises huge beams, and structures, and volumes of water by the application of the lever, or the pulley, or the pump, he is simply utilizing knowledge; and all of the so-called "practical" that is effected by rule of thumb, without an adequate and probably unrecognized basis of knowledge, is done at a dead loss of work, which is capital, and of time, which is profit.

I repeat, that every great industry on this coast is largely and directly interested in the subject of a physical survey of the State, and the humblest trades and professions are therefore certainly and intimately affected, and affected favorably.

The great mining interests, in the precious and base metals, in coal, building material, etc.; the millions of money and thousands depending upon the success of agricultural investments; the large capital bound up in manufacturing and commercial enterprises; the steamboat and railroad undertakings, involving so much of wealth and comfort, and rapidity and certainty of traffic; the enormous sums locked up in landed property throughout the country; all these fail to attain their legitimate proportions and security when insufficient knowledge hinders and balks their development. And all of these interests are so interwoven and so inter-related that one cannot suffer without the remainder becoming nervous and enervated by sympathy.

I do not pretend that a physical survey of this State will afford a panacea for the commercial distress and the agricultural dismay that cloud our souls to-day, but I do positively assert that such a survey, if completed and its deductions honestly acted upon, would, for instance, have enabled us to avert much of the distress arising from the failure of our crops, and ramifying every artery of trade. It would lead to a guarantee for the safe and permanent investment of every man's means, and of the labor of his hands, and the wit in his 10 fingers, if his capital be nothing more. Those who have invested their money in operations based upon insufficient knowledge, know to their sorrow that it might have been much better employed, had proper data been available.

The development of the agricultural and mineral resources of this State has satisfied those who reflect upon the intimate relation necessarily existing between the uniform production of the country and the general prosperity of the population; that a higher and a more difficult problem is offered for our solution than the patient and anxious waiting for the rains of heaven to supply the fertile land and the forests with water, and the mountain streams with their quantum sufficient for mining purposes.

We may assert it as a dictum, that the agricultural prosperity of this State has reached its maximum without recourse to artificial means of supplying water to the soil. This is not an impromptu *ad captandum* assertion, but the deliberate and painful conviction following an intimate, earnest, and prolonged acquaintance with nearly the whole territory of the Pacific seaboard; and as the solid foundation of a State's prosperity and population is mainly in and related to her agricultural wealth, we must also conclude that, without unexpectedly favorable influences, the population of the country will becometh but slowly increase.

Our State has an area equal to that of Spain, but a population only one twenty-fifth as great. We have a great valley that would support 5,000,000 of people, and during this year its sparse population has been almost in despair. Millions of acres of land have remained untilled or have borne no crop; hundreds of thousands of animals have perished, and yet the rivers have been running to the ocean, the life-blood of this State has ebbed without imparting a spark of vitality, the green places are parched and arid. I refer to the agricultural phase of the problem because it is brought home so painfully and directly to hundreds of thousands of our people, to the whole population indirectly. I mention it because the solution of one part of it seems so readily understood; we are not standing still for want of the necessary skill to accomplish what is sought; but each and all seem waiting for some supernatural interposition to bridge them over the rainless years.

What will this physical survey give to the

State? When shall it be undertaken? How shall it be carried on? Will its cost be excessive? These and a hundred correlative questions may readily be propounded, and yet to each I am convinced that a satisfactory answer can be given.

Let me answer the main question that must arise in many minds. *Qui bono?*—of what good is it?—by asking another and analogous question. Of what good has been the survey of the Pacific coast of the United States? The mapping of its outline, its dangers, its harbors, its islands; the establishment of light houses, fog whistles, buoys and other aids to navigation; the knowledge of the currents and winds, and climatology; the variation of the compass and its secular changes and local peculiarities; the geographical position and elevation of thousands of positions; the marked peculiarities of the tides, whereby they are closely predicted for years in advance, and a multiplicity of other information that daily and hourly has its practical application in a hundred ways. To-day no seaworthy vessel need go ashore that is honestly found and manned, and properly handled. As a consequence the insurance has decreased, and should be far less upon this coast than upon the Atlantic and Gulf seaboard. The loss of life is necessarily diminished, and all commercial ventures depending upon regularity of passage must profit from the knowledge acquired. The partial information, early made known, of the great currents of the north Pacific, and their effects upon the weather, solved the question against the great circle route from San Francisco to Yokohama, or even to Hakodadi; even if the commercial advantages of the steam route to China through the warmer and more agreeable latitudes had not been shown to outweigh any merely theoretical and shorter, but more hazardous route.

A perfect map of the physical features of California should give all the data that could be demanded by the farmer seeking for land and a home; by the manufacturer, seeking to establish new industries, or to enlarge previous ones; and by the capitalist, seeking for the investment of money in developing its natural resources.

Amongst other information it should afford a complete geographical exhibit of its entire surface. This is absolutely necessary for the agriculturist, the miner, the engineer, the settler, and to the State as a body politic. Without it we can never fairly study the hydraulics of the Sacramento valley; the reclamation of our swamp lands; the irrigation of our millions of rainless acres; the relation of our mineral and timber belts; the most advantageous and profitable lines of transportation; the opening of new avenues of communication and traffic. Every day for years I have been appealed to for information upon these and cognate subjects—information that is scattered in hundreds of dribbets, frequently without recognized authority unless gathered by the State or General Government. The demands are unceasing; the growing need for sound and certain knowledge is increasing fourfold with every dollar to be invested; every year's delay complicates property relations, and involves dead loss from erroneous work.

With such a survey the problem of reclamation and irrigation can be shaped for solution; system can be evolved from the present chaotic condition, and future interminable complications lessened or avoided. It will open fresh fields for the farmer, and give a guarantee for his metes and bounds; it will settle many difficulties arising from imperfect surveys, or from surveys made where local causes are obnoxious yet unknown; it will afford the means of best studying the effects produced in our rivers and the adjacent lands from the deposit of the detritus from hydraulic mining.

The geographical map is the ground and basis of every other character of work involved in a physical survey. The engineer studies it for the location of railroads, highways, canals. Had such a map been in existence the requisite field work of the Water Commissioners would have been a minimum, and the logical conclusions decisive and final. The State studies it to control the projection of railroads by corporations, and may definitively measure the value of any proposed scheme. It can decide almost with certainty what enterprise shall be supported and what condemned. It can winnow the true from the false with merciless precision. It will assist in quieting titles and give stability to landed property. Abroad and in the Atlantic States it would be studied by the thrifty and ambitious householder and mechanic; and by the manufacturer with means to invest, whereby its development would be hastened. It is in vain that you look for details in any published map of this State. Distances are erroneous, orographical features exaggerated or ignored, and locations established very much as in John Phoenix's classical survey of the Mission Dolores. The whole system and method of the usual land surveys of the Government is a delusion and a snare, and any and every map based upon them adds to the confusion. It is but a little over four years since the eastern boundary of this State was discovered to differ three-quarters of a mile from the official location, and nearly two miles in the opposite direction from another survey. About the same time the northern boundary of the State upon the seaboard was discovered to be over half a mile erroneous in its latitude; each settler claimed to be in Oregon when the California tax collector made his appearance, and when the Oregon tax collector grew certain of his game the same settler claimed to be within the State of California. Within a very few miles of San Francisco the

sea coast, by one survey, is suddenly thrust one mile further into the Pacific ocean than by the adjacent survey. On the northern seaboard the coast line is laid down upon a recent map only 17 miles in error, and Cape Lookout is unceremoniously projected four miles further into the Pacific than we have found it. In some recent examinations I found the given position of a well-known landmark and mountain eight or ten miles in error, and a group of snow peaks much further from the truth. With such work before us when shall we ever know the bounds of any piece of property—even its position on the face of the earth is mythical.

This survey would exhibit the character of the soil, its relation to water courses, highways, railroads, its height above the ocean, its relation to the rainfall, to the winds and its location among the isothermals. These would enable all—the old settler and the incoming farmer, to choose their locations without the time, expense and annoyance of traversing the State, at the risk of receiving untrustworthy information from those interested and prejudiced.

It would graphically exhibit the rainfall throughout the State, the force and direction of the winds, the temperature, the hygrometric

Pile Treated by Culver's Process.

condition, the distribution of the flora and principally the extent and character of forest woods and chapparal, the latter for one of the reasons for knowing where the timbered lands lie, its preventing the rapid and destructive effects of the rainfall when quickly reaching the water courses, small and large.

It would exhibit the geology of the State and guide the prospector, the miner, the engineer and the capitalist. It would furnish the material for the intelligent discussion of the economic geology of the country and make it available for every intelligent reader. Much has been already accomplished in this direction and it needs but the collating and publication to be available. The interest manifested in the East in the work alone, prompted the National Academy of Sciences, at its last annual meeting, to urge, by resolution, one of its members to use every honorable effort to have the work which has been done published as early as practicable. Yet we sit with folded arms and move not. At present the two great industries of the State are agriculture and mining. Manufacture and commerce necessarily have an intimate relation and high ratio therewith. This physical survey would among other information afford us tangible, practical and reliable knowledge, applicable to the varied industries which are intimately dependent upon the geology of the State. It would have great influence upon the opening of the deposits of coal, iron, quicksilver, tin and the metalliferous ores generally, guiding the mining engineer in his search and controlling the investor and manufacturer in their relation to means and ways of transportation, and in their relation to

fuel, to water, to supplies and to population. The hundred conditions and contingencies which mar projects, if insufficiently known, would be herein fairly presented for sober discussion and logical deduction. Capital and labor and life that might be wasted in undigested schemes could be surely and securely invested in safe projects to the benefit and prosperity of the State.

The hydraulic mining of this State is yet in its infancy, and there is, doubtless, sufficient gravel deposits already known that will afford large annual yields for the next century; but there is very much yet to be learned and predicted concerning them and their economical working. This survey would exhibit the orographical features and accidents, the sources and extent of the supply of water, the safest and cheapest route for getting it to the work, and enable the engineer to predict the prospective effects of the vast quantities of detritus carried to the lower lands.

I know of no industry which it would not aid and encourage. The fisheries upon the coast and throughout our waters; the commerce along the immediate seaboard; the deep sea traffic carrying our agricultural, mineral and manufactured products to the ends of the earth.

Its beneficial influences would be exerted in a hundred channels not yet appreciated. As a mere question of business it would be the *ne plus ultra* of advertising in the East, and throughout the world, the physical advantages of our State.

In one sense such a survey would have to be undertaken *de novo*; but already much authen-

The Lightning Can Opener.

tic information is in existence although only partially published, and all disconnected. Every iota of knowledge that has been honestly garnered can have assigned a place and weight in the structure.

As I have already said, the geology of the State has been well advanced, and a large mass of unpublished material is in existence; this can all be utilized. The U. S. Coast Survey has almost completed the topographical survey along the line of coast, giving the orographical features thereof; the hydrography of the coast has been well advanced and is available. The triangulation has been nearly completed from Mexico to Oregon and has commenced spreading its net-work over the whole State. This gives to the State thousands of geographical positions and elevations; the length and true bearings of lines whereby the surveyor can determine quickly and unmistakably the variation of the compass at numerous localities throughout the State. They enable contrasts depending upon distances, etc., to be fairly drawn. In a

Section of Pile Eaten by Ship Worms.

short period the Coast Survey will measure in Yolo county the longest base line ever adopted in any triangulation, and upon it will be built up all the work of the State. All this work the State of California can obtain for the simple asking and copying. And, moreover, by adopting it she preserves the unity of the standard measures of the State and general Government; and homogeneity in the system of work, and in the expression of physical phenomena. Other States are moving in these matters, although possibly not to the completeness which I suggest under the term of a physical survey of California. In 16 States the Governors have applied to the United States Coast Survey for the geographical data necessary for the ground work of surveying the States, and in most of them examinations and measurements are being made. Errors of distances between large towns and cities have been rectified; discrepancies of the old surveys have been adjusted, and the newer and more accurate methods adopted.

The relation which we bear to the Atlantic States; the peculiar character of our climatology; the wonderful favorableness of the wealth of our soil; the winters for carrying on all employments; the wealth from fisheries; the productiveness of our precious metals; the unique geographical position which we hold upon the west coast, whereby we must inevitably control the trade of the Pacific ocean; these, and the considerations already enumerated, and a thousand others that will spring into life, demand that this State should promptly and seriously undertake and carry to completion, a thorough and exhaustive physical survey of the State of California.

Protection of Timber in Salt Water.

In the last number of the PRESS, we gave illustrations of the *Limnoria terebrans*, a little timber-boring shrimp or grebble, which is very destructive to the wharves in this harbor. Mr. Jno. P. Culver, civil and hydraulic engineer, 542 Market street, has issued a pamphlet, in which he describes these little animals and also *Teredo navalis*, or ship worm, which is very destructive here. Mr. Culver has patented, through the MINING AND SCIENTIFIC PRESS Patent Agency, a method of protecting piles, timber, etc., from the ravages committed by these creatures, and, in the pamphlet referred to, figures and describes them. We give space to an engraving, showing the appearance of a section of a pile (sawed in two) eaten by ship worms, and also one showing the method adopted by Mr. Culver to protect the pile.

The teredo bores lengthwise, the grain of wood following the rings of annual growth. As long as any wood remains to be eaten between the stages of water where they work, which is usually between low tide and the mud line, they continue completely riddling this wood. In the harbor of San Francisco they are very destructive, as well as along the coast.

The *Limnoria terebrans* eats lengthwise and crosswise the wood both. The teredo and limnoria together make a combination which heretofore has been omnipotent, so that when they once started in on a pile, there was no chance for it. The process invented by Mr. Culver, to prevent these ravages, consists in treating the piles, with the bark on or off, as follows: First there is a poisonous composition brushed over the surface of the pile or timber, which is allowed to dry; then the pile or timber is coated with asphaltum, laid on at great heat to the bare wood, after which burlaps, treated in asphaltum, are wound around in spiral courses while warm and finished by a final coating of hot asphalt. The piles can be handled, transported and driven without injury to the coating.

This pile is first covered with the poisonous composition over the surface, which is shown as darkly shaded in the engraving. The pile is then wound with spiral courses of treated bagging over the same part and then given a final coat of asphalt finishing and is ready to drive.

The cloth or fibrous material being thoroughly saturated with hot asphalt, and protected, will not decay, and forms at the same time a cheap non-corrosive, indestructible, elastic covering, closely adherent and bonded to this wood or bark on the outside of the pile, and held there by the spiral wound fibrous bagging.

Two destructive elements have to be considered in protecting piles in salt water: First, the teredo and boring shrimp below the tide lines; second the natural decay of the wood above the tide lines. By protecting the piles below tide lines with the patent covering, or shell the work of the worm and shrimp is effectually stayed. The cost of preparing a pile in this way is \$3.50, and other timber work in proportion. There are some piles in Battery street wharf treated by this process, which have been down nearly a year, and we are informed that they have not been attacked yet by either the limnoria or teredo. Piles treated this way have been in New York harbor for three years, and the teredo has not attacked them.

An Improved Can Opener.

We illustrate herewith the "Lightning can opener," a device recently patented through the MINING AND SCIENTIFIC PRESS Patent Agency, by J. P. Louesdale. As will be seen by the engraving, this little implement is both simple in construction and operation, and consists of a sharp steel knife, of the shape shown, which is firmly attached to the handle. To open cans which are usually filled up full and compact, such as many cans of vegetables, the opener is placed on its point on the end of the can, and with both hands on the two ends of the handle, the operator presses steadily downwards, until the handle or cross-bar brings up on the end of the can. This will cut out the circular hole the size of the cutter, all except the space at the heel of the same, leaving a neck to the chip, which answers as a hinge in turning the chip back and forth for a temporary covering. Or if desired, it may be cut out entirely, by revolving the opener slightly and severing the neck with the edges at the heel or by raising the opener slightly and cutting with the edge between the heel and point.

The can can also be opened by holding it in the left hand and the opener in the right (after pressing the opener down with both hands) by revolving the opener to the right and left, as desired, and thus cutting out the entire opening or only a portion of it, as preferred. With large sized cans it is not necessary to hold the can with either hand, as the weight of the can will be sufficient, together with the slight pressure on the opener, to keep it from moving, in which case both hands will be free to turn the opener, as in boring with an auger. This device is a very decided improvement in can openers, being simple of operation and showing no liability to slip and cut the hands. Parties wishing to examine it can see the opener at K. Kenney's, 22 Kearney street, or address G. W. Traver, Oakland. It is desired to sell the right to manufacture and sell for the Pacific coast.

The Pig Iron Market of San Francisco.

The following circular has been issued by Messrs. Jeffrey & Harrison:
TO THE IRON IMPORTERS AND FOUNDRYMEN OF SAN FRANCISCO—GENTLEMEN:

We herewith submit to you as a reference, our annual review of the pig iron market of San Francisco, for the year ending December 31st, 1877.

The monthly quotations, as given below, show that the pig iron market has ruled very uniformly during the year, caused by the heavy stock carried at the commencement of the year, and the importations from the Eastern States and from England. Prices have ruled low because of a marked falling off in the consumption in 1877, as compared with 1876—the use being made of fewer contacts for heavy mining machinery and for house fronts.

In estimating a amount of stock on hand we have included all the pig iron in the interior of California, and the State of Nevada.

But few sales of Scotch Iron were made "to arrive" during the year. Considerable American Iron was placed "to arrive" at from \$28.25 to \$29.50, according to brands.

The following will give the monthly quotations for the year 1877:

SCOTCH, SOFT.	
January.....	\$31.00
February.....	31.00
March.....	30.00
April.....	30.00
May.....	30.00
June.....	30.00

ENGLISH AND AMERICAN, WHITE.	
January.....	\$28.00
February.....	28.00
March.....	28.00
April.....	28.00
May.....	28.00
June.....	28.00

SCOTCH, SOFT.	
January.....	\$29.00
February.....	29.00
March.....	29.00
April.....	29.00
May.....	29.00
June.....	29.00

We find the stock of pig iron on hand Jan 1st, 1877, 1878, 1879, 1880, as compared with the stock on hand Jan 1st, 1877.

Stock on hand.	
Total.....	17,365
Total.....	20,765

The above figures show a decreased consumption this year as compared with last of 3766 tons, viz: 3003 tons of Soft and 747 tons of White. The importations of 1877 show a decrease of 5733 tons as against the importations of 1876.

NOBLE ILLUSTRATION.—Lord Canarvon, in addressing the people of Birmingham, used the following illustration: "Travelers tell us that in some of the Eastern seas, where those wonderful coral islands exist, the insects that form the coral within the reefs, where they are under the shelter of protecting rocks, out of the reach of wind and wave, work quicker, and their work is apparently sound and good. But on the other hand, those little workers who work outside those reefs, in the foam and dash of waves, are fortified and hardened, and their work is firmer and more enduring. And so I believe it is with men. The more their minds are braced up by conflict, by the necessity of forming opinions upon difficult subjects, the better they will be qualified to go through the hard wear and tear of the world, the better they will be able to hold their own in that conflict of opinion which after all it is man's duty to meet."

WOODWARD'S GARDENS has the following new attractions: The buffalo, the large scale collection; new museum; improvements in the zoological department, besides the other features which have made it popular.

OUR AGENTS.

OUR FRONTS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. L. THARP—San Francisco.
B. W. CROWLEY—California.
A. C. KNOX—Pacific Coast.
C. N. WEST—Santa Cruz, Monterey and San Benito counties.

A. C. CHAMPION—Tulare, Fresno and Inyo counties.
EDWARD S. BAKER—Australian Colonies and Sandwich Islands.

W. D. WHITE—San Bernardino and Los Angeles counties.

J. W. A. WRIGHT—Sacramento, Placer and San Joaquin counties.

B. E. LLOYD—Alameda, Contra Costa and Napa counties.

E. M. DENNY, Oregon.
F. B. ALDERSON, Nevada.

H. E. HALL—San Joaquin, Yolo, Yuba, Sutter and Colusa counties.

TESTING AND WORKING SILVER ORES.—This is the title of an illustrated work of 114 pages, for Miners and Prospectors, by Chas. H. Aaron, published by Dewey & Co. It is written for miners, in plain language, and with all necessary details in description. The author describes the different processes of roasting ores, the appliances, methods of testing ores, testing for a process, working samples, treatment of base metals, use of chemicals, leaching processes, different kinds of crushing apparatus, etc. This little work abounds with useful hints to miners and prospectors, and is written in a practical style. Price, post free, \$2.00. Address, Dewey & Co., Mining and Scientific Press, 224 Sansome St., San Francisco.

BOOKS FOR THE PEOPLE.

For Sale on the Pacific Coast at the
Lowest Cash Price, by

Any of the above books will be sold on the Pacific Coast, by Dewey & Co., and mailed for the price named. (In some instances there may be a delay (not over twenty days) from receipt of orders with the cash.)

Other agriculture books furnished at the publishers' prices.

DEWEY & CO., Publishers,
202 Sansome Street, San Francisco.

The Large Circulation of the **MINING AND SCIENTIFIC PRESS** extends throughout the mining districts of California, Nevada, Utah, Colorado, Arizona, Idaho, Montana, British Columbia, and to other parts of North and South America. Established in 1860, it has long been the leading Mining Journal on the continent, its varied and reliable contents giving it a character popular with both its reading and advertising patrons.

TO QUERISTS.

In propounding questions to the editorial, patent or business departments of this office, letter writers should be careful to enclose a stamp and addressed envelope if they wish prompt answer. If we were to furnish time, paper, envelopes and stamps, all free to parties who address this office on matters of more interest to themselves than to us, five hundred numbers a year would not cover the expense. This hint, however, is not intended for parties writing in our own or the public interest, or who would be obliged to delay writing at any time for want of an extra stamp.

EVERY new subscriber who does not receive the paper and every old subscriber not credited on the label within two weeks after paying for this paper, should write personally to the publishers without delay, to secure proper credit. This is necessary to protect us and the subscribers against the acts and mistakes of others.

KRISTEL'S CONCENTRATION OF ORES (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver ores generally, with 120 Lithographic Diagrams, 1867. The most complete treatise. Published at this office. Price, \$7.50. Postage, 50 cents extra.

A VALUABLE MINING BOOK.

BY J. S. PHILLIPS.

The Explorers', Miners' and Metallurgists' Companion, 682 pages, 83 illustrations. Second Edition. A California publication.

OPINIONS OF THE PRESS.

The book is exactly calculated to suit the views and meet the requirements of those for whom it has been written.—*London Mining Journal.*

The most practical and comprehensive work on mining subjects extant, and valuable book of reference.—*Mining and Scientific Press, San Francisco.*

We know of no work on these subjects in the English language at once so comprehensive, practical and intelligible.—*S. F. Golden Era.*

He has rendered to the leading industry of the coast a valuable service—has furnished the millman and miner a safe and much needed practical guide.—*Overland Monthly.*

This book, which treats in an intelligent and practical way on almost every topic connected with mining pursuits, should be in the hands of every millman, metallurgist, prospector and miner on the Pacific coast. Even the capitalist, and, in fact, every person already engaged in, or likely to become interested in the business of mining, will find in this comprehensive work an amount of information that they cannot afford to dispense with.—*S. F. Commercial Herald.*

This book is free from trash, and solid throughout; all its matter is intelligible to men of ordinary education, and all of it is valuable to miners.—*S. F. Daily Alta.*

In the several sections the work is eminently practical. Is very comprehensive, and contains a great deal of useful information which cannot be obtained from the previous books that have been written on these subjects.—*S. F. Daily Examiner.*

It affords a vast quantity of information as to the appearance and value of different ores.—*S. F. News Letter.*

It is the best single English treatise we know for the use of prospectors and practical miners.—*The Engineering and Mining Journal, New York.*

Sold by Dewey & Co., at this office. Price \$10.50.

Questions of the Times.

Which are the most reliable watches?
American watches, they are driving those of foreign make out of the market.

Which is the best American watch?
The Hampden watch, made at Springfield, Mass.

Why is it the best watch?
Because it is substantial in all its parts, constructed on the best principles and embodies those improvements which experience has shown to be most desirable.

Why is the Hampden watch so popular?
Because in buying one you are sure of getting a good time-keeper. While purchasing a watch of most other makes is like investing in a lottery—a great many blanks to one prize.

Which is the cheapest watch?
The most economical is the Hampden watch. For you can get one of these excellent time-keepers for less than it costs in a short time to patch up a poor watch, which benefits no one but the repairer.

Where can I get a Hampden watch?

By addressing the long established, practical watchmakers and jewelers, **DEWEY & JORDAN**, 433 Montgomery St., San Francisco, who will send you a descriptive price list, including the following styles of movements: "John Hancock," "Geo. Sam. Rice," "Chas. E. Hayward," "Aaron Bagg," "Thos. E. Sundry," "Chester Wolworth," "Frederick Billings," "Railway," "John L. King," "E. W. Bond."

HOW TO ADVERTISE.

The following views of some of our most successful business men, says an exchange, will be very generally concurred in:

"The tawdry lithographs so freely used by certain manufacturers neither express good sense nor good taste; they suffer even by comparison with the comic valentine, for although the latter is essentially vulgar, and frequently a hurtful missile in the hands of a foolish or a malicious person, it means something; it has about it some touch of humor—it tells for what it was designed. But the stove manufacturers' valentine, I mean the red and yellow lithograph, has no redeeming qualities about it. At best, it but announces the thoughtlessness or want of dignity of its author; and if it does not hint with a certain degree of positiveness at the probable inferiority of his wares, it is less injurious than I have been inclined to regard it."

"Fence advertising cannot be too emphatically condemned; to characterize it as vile is scarcely to do it adequate justice. It is primarily objectionable, because it brings the manufacturers who wish to advertise into doubtful company on the public highways; and every prudent business man must know, if he has given to his advertising the careful attention it deserves, that the money devoted to papering fences is utterly wasted. We know a gentleman who expends \$150,000 annually for advertising, but you cannot find his name on the fences; he is the best advertiser in the country, but there is nothing comical or grotesque about his way of doing business."

"The glaring poster neither inspires confidence nor conveys the information the public desire; and if we would make the best possible use of our money in giving publicity to our claims as manufacturers, we should patronize able and responsible newspapers. The newspaper is immeasurably the best medium open to our trade; the most liberal and expert advertisers testify to its value; and in the employment of its columns we would find a means of escape from the wasteful, undignified and ineffective methods to which so many now resort in their eager desire to secure attention and patronage."

Contents of Pamphlet on Public Lands of California, U. S. Land Laws, Map of California and Nevada, Etc.

Map of California and Nevada; The Public Lands; The Land Districts; Table of Rainfall in California; Counties and Their Products; Statistics of the State at Large.

Instructions of the U. S. Land Commissioners.—Different Classes of Public Lands; How Lands may be Acquired; Fees of Land Office at Location; Agricultural College Scrip; Pre-emption; Extending the Homestead Privilege; But One Homestead Allowed; Proof of Actual Settlement Necessary; Adjoining Farm Homesteads; Lands for Soldiers and Sailors; Lands for Indians; Fees of Land Office and Commissioners; Laws to Promote Timber Culture; Concerning Appeals; Returns of the Register and Receiver; Concerning Mining Claims; Second Pre-emption Benefit.

Abstract from the U. S. Statutes.—The Law Concerning Pre-emption; Concerning Homesteads; Amendment Act Concerning Timber; Miscellaneous Provisions; Additional Surveys; Land for Pre-emption; List of California Post Offices. Price, post paid, 50 cts. Published and sold by **DEWEY & CO., S. F.**

DEWEY & CO'S SCIENTIFIC PRESS Patent Agency.

Office—202 Sansome St., N. E. Cor. Pine, S. F.

PATENTS obtained promptly; Caveats filed expeditiously. Patent re-issues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Soliciting Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons, and our success and business are constantly increasing.

The shrewdest and most experienced inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

EDUCATIONAL.

THE BERKELEY GYMNASIUM.
 A PREPARATORY
SCHOOL TO THE UNIVERSITY.
 THE FIRST TERM WILL COMMENCE
 Wednesday, August 1, 1877, and close Thurs-
 day, December 20, 1877.

THE SECOND TERM WILL COMMENCE
 Wednesday, January 9, 1878, and close
 Thursday, May 30, 1878.

The location of this Institution for health, has no supe-
 rior. Its proximity and relationship to the State Uni-
 versity give it many advantages that no other school on
 the Pacific Coast can command. Our first aim is to secure
 to every student in our charge such accommodations as
 will make him

Comfortable and Contented.
 Devoted to but one well defined work, we are gathering
 around us the youth of loftier minds and purer aspira-
 tions; such as are seeking a higher education. We are
 protected, naturally, from that class of students who
 are sent to school to escape the House of Correction.
 The Principal and Faculty respectfully solicit a fair in-
 vestigation from intelligent parents and earnest students.

FRAGARICULTURE;

—OR THE—

Culture of the Strawberry.

A PRACTICAL TREATISE ON

**Culture, Propagation, Management
 and Marketing of Strawberries.**
 1878.

Illustrated with Photographs, representing
 the average size of best varieties.
 Especially adapted to the
 Family Garden.

BY **FELIX GILLET,**
 Nevada City, Cal.

TABLE OF CONTENTS.

Fragariculture; Description; Varieties; Selection; The
 Soil; Preparation of the Soil; Manures; Time of Setting
 Strawberries; Setting out Strawberries; Culture in Rows
 and Hills; Matted Row System; Mulching; Irrigation;
 Care of Plants after Setting; Propagation; Propagation by
 Seed; Resetting; Exposure; Annual Varieties; Biennial
 Varieties; Ever-bearing, or Wood Varieties; Bush-alpine
 Varieties; Staminate and Pistillate Plants; Hybridization;
 Forcing Strawberries; Care to Plants Forwarded by Mail;
 Duration of Strawberry Beds; Mode to Perpetuate Straw-
 berry Beds; How to make Strawberries Last; Spring
 Work on Strawberry Beds; How to Raise Very Large
 Fruit; How to Pick and Keep Strawberries; Packing
 and Shipping; Insects Injurious to Strawberries; Maladies
 of the Strawberry; The Art of Preparing Strawberries; Pre-
 serving Strawberries; Medicinal Properties of Strawber-
 ries; General Hints on Fragariculture; Explanation of
 Photographs, and list of best varieties.

PRICE—50 CENTS A COPY.

Each photograph represents a group of strawberries—
 three to five—and not a single one, and is six inches by
 four inches.
 NOTE.—It is the most complete, practical, interesting
 treatise on Strawberry Culture ever published in the
 United States. Address

REGISTER YOUR
TRADE

MARKS.

The U. S. Government now offers greater protection
 than formerly to manufacturers under the law of Trade
 Marks.
 Those who manufacture a superior article, or put up
 improved packages of merchandise, should protect them-
 selves from imitations by registering their Trade Marks.
 We have special facilities for securing full rights by the
 registration of Trade Marks, and our terms are very reason-
 able.
 Consultations free. Many dealers have missed fortunes
 from not being fully informed and protecting themselves
 in their rights.

 No. 202 Sansome Street, S. F.

A. T. DEWEY.
 W. B. EWER.

JNO. L. BOONE.
 GEO. H. STROGO.

Among the advantages gained by this holder are the
 following:
 It can be opened and closed quickly.
 The points are less obstructed while the articles to be
 filed are placed.

The papers (wholly or partly folded) can be either
 "straddled" over the lower bar, or filed in regular book
 order.

The elastic hinge and band accommodate and hold firm
 either a large or small number of papers.
 With less material, it is lighter and less cumbersome
 than other holders, and approaches nearer to bookbinding.
 It has no rigid hooks, hinges or loose parts to break or
 get lost.

It has proved durable in practice. The file is adjusted
 but 52 times a year for a weekly paper, and a sample
 holder can be opened and closed 1,000 times without
 showing wear.

Five sizes are made to suit the dimensions of different
 papers, viz.: 18, 22, 26, 30 and 34 inches, inside measure.
 Single samples will be mailed from office for 50
 cents, (and upward, according to size), postpaid. Whole-
 sale and retail agents wanted.

Smelter and Refiner.

A competent person is desirous of receiving the position
 of Superintendent of a Smelting and Refining Works.
 Can give satisfactory reference for ability to smelt all lead
 ores, refine silver and make market lead. No objections
 to go to the Territories. Address P. F. M., this office.

ARITHMETIC MADE EASY
BY ROPP'S
EASY CALCULATOR.

This valuable work is used by thousands of farmers,
 mechanics and business men, and is highly recommended
 for its practical utility and convenience.

It embodies an entirely new system of calculation, by
 which a vast amount of figures and mental labor—required
 by the ordinary methods—and fractions with their com-
 plexities, are absolutely avoided.

It is so simple and easily comprehended that even the
 most illiterate is enabled in a few minutes, to reckon
 with absolute accuracy and speed; while its original and
 rapid methods, benefit and delight the most scholarly.

It shows at a glance the accurate value of wheat, corn,
 rye, oats, barley, cattle, hogs, hay, coal, lumber and mer-
 chandise, from one pound to a car load, and for any price
 the market is likely to reach.

It gives the interest, simple and compound, on any sum,
 for any time, at six, seven, eight, and ten per cent.; the
 exact measurement of boards, scantlings, timbers, saw
 logs, cisterns, tanks, wells, granaries, bins, wagon beds,
 corn cribs, etc., the wages at various rates, for hours,
 days, weeks and months; besides numerous other impor-
 tant methods, rules and tables.

It is printed on fine tinted paper, is well and elegantly
 bound in pocket-book shape, and accompanied by a sil-
 cate slate, pocket for papers, and memorandum, which
 can be replenished in the two latter styles.

It answers the purpose of a pocket book and diary, and
 costs no more, although it was gotten up at great expense
 and labor, and is unquestionably one of the most useful
 publications ever issued from the press.

Price, bound in Fine English Cloth, \$1.00.

Send direct from the Eastern publisher, postpaid, on
 receipt of price, by P. O. order, registered letter or
 receipted by express. Address

MINING LAWS AND DECISIONS.

Copp's Hand Book of Mining Laws.
 In this little work is given the United States Mining
 Laws and Instructions. Also, a digest of the decisions
 under the laws, by the Secretary of the Interior and
 Commissioner of the General Land Office.

Forms are given for making out notice of location,
 proof of labor, application for survey, and in fact all the
 blanks a miner needs.

There is also a list of all the mines for which U. S.
 Patents have been obtained from July, 1860, to August,
 1877, with location, township and range.

A handy companion for miners. Price \$1, post paid

PATENTS AND INVENTIONS.

List of U. S. Patents Issued to Pacific Coast Inventors.

(FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.)

By Special Dispatch from Washington, D. C.

WEEK ENDING DECEMBER 25TH.

EXCAVATOR.—J. A. Ball, Oakland, Cal.
COMBINED OVERFLOW AND GAS TRAP FOR STATIONARY WASH BASIN.—A. K. Grim and J. B. Low, S. F.
STRETCH TRAP.—A. K. Grim and J. B. Low, S. F.
SNOW-FLOW.—G. Royal, Truckee, Cal.
CLAMP FOR ROCK DRILLS.—P. S. Buckminster, Belleville, Nev.
STRETCH TRAP.—F. W. Volkmann, S. F.
UNDERMINE.—Clair S. Bradley, S. F.
PORTABLE HOISTING APPARATUS OR WAGON DERRICK.—W. W. Carille, Ione City, Cal.
HARROW.—Frank A. Hill, San Leandro, Cal.
HARVESTER AND THRESHING.—W. B. Rico, Modesto, and J. C. Hault, Stockton, Cal.
WOOL WASHING MACHINE.—J. Bachelder, Napa, Cal.
CHUCK FOR ROCK DRILLING MACHINES.—P. S. Buckminster, Belleville, Nev.
SPRING-COCK ATTACHMENT.—S. W. Denniston and C. Simmonds, Prescott, A. T.
SWINGS.—C. Hartman and F. A. Freese, S. F.
BED BOTTOM.—T. J. Pettit, S. F.
MACHINE SHUTTLE.—C. H. Schumacher, Walla Walla, W. T.

The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of mention:

REMOVING AND DESTROYING SEWER GASES.—S. J. Corbett, Los Angeles. This is a novel method for destroying such noxious gases as are generated in the sewers of a city. It consists in leading a pipe from the sewer to each of the gaslights along its line, so that the gases will be conducted to and delivered into the flames and be destroyed. Numerous plans have been devised to prevent the escape of these foul gases through the conduits which lead from sewers into houses and into the streets of a city, without adequate means being provided for allowing them to make their escape from the sewer. This compels the gas to accumulate in the sewers, so that they soon become charged with it, and the difficulty of preventing it from escaping into the houses and streets is increased. Mr. Corbett's plan is intended not only to provide a vent through which these gases can pass to the open air in the day time as fast as they accumulate, but when the gas is lighted at night, each gas jet establishes a draft through the sewer gas vent pipe, which draws the gases into the flame, where it is destroyed, thus preventing any accumulation of gas in a sewer.

WELL BORING APPARATUS.—Joseph Benner-schidt, Anaheim. This invention relates to an improved device for sinking or boring wells, and for removing the earth and borings therefrom. It consists in the employment of a hydraulic stream of water forcibly ejected through a pipe and nozzle against the earth in the bottom of the well by a pump. As fast as sinking proceeds the curh or lining is forced down into the excavation, so that the stream of water has only a diameter equal to the diameter of the tube or curh to act directly upon. The water forced in rises in the pipe and overflows its top, carrying off the detached soil loosened by the force of the water. A flexible hose with an iron pipe on the end is used to carry the water to the bottom as it is forced down by the pump.

BED LOUNGE.—Frederick Jensen, Seattle, W. T. This invention relates to an improvement in bed lounges, and consists in the peculiar construction of springs employed, together with adjustable head rests, and the legs in combination with a hand or strap. The arrangements of springs is especially adapted for use in bed lounges.

FIRE BRICK.—W. P. Prescott and Geo. R. Evans, Carson City, Nev. This invention relates to an improved combination of materials for forming fire bricks, which will withstand any ordinary temperature to which they may be subjected. Asbestos enters largely into the structure of the new fire brick.

News has been received at Eureka that T. J. Andrews, formerly foreman of the Raymond & Ely, and a well-known mining man, has just made a good strike near Cherry creek. He has a three-foot ledge, which assays well. There is not a pound of waste rock in the vein. There is great excitement in Cherry creek and vicinity over the discovery.

We commend to the attention of the members of the Legislature Prof. Davidson's able article on the necessity of a physical survey of the State of California, which we publish in this issue of the PRESS.

Mining Share Market.

The feature of the week in mining stock circles has been the "deal" in Alta. Over 40,000 shares changed hands in both Boards on Wednesday. Attention is just now turned more particularly to the Alta and Justice mines, from the statements of a bonanza between the two and the antagonistic interests. The rulers of the Justice persist in pushing the suits against the Alta, for the alleged wrongful conveyance of the property and rights of the Justice stockholders to the Alta company, and demand a reconveyance of the alleged fraudulently conveyed property. It is even intimated that criminal will supplement the civil proceedings. The Justice people bring suit to set aside the alleged fraudulent deed to the Alta, and measures were taken to have the Cook brothers brought into Court and required to explain on oath the precise circumstances and considerations attending the conveyance of the Justice ground and the execution of the mysterious deed signed by the ousted President of the Justice. The Alta people do not seem to be in any hurry to have the proceedings terminated, and, in fact, it looks as if they were purposely delaying the proceedings. The case has been transferred to the U. S. Circuit Court, as certain points devolve upon construction of Federal law. The search of the important deed, drawn for a consideration of \$1, is a matter of great interest to stockholders just at present more than any previous time, when rumors of a bonanza are so plentiful.

In connection with this matter the Gold Hill News says: There is no doubt at all of the development of a valuable ore deposit in the Alta, and the principal trouble at present is to find out who has the best title to it. Rumors of a compromise between the various contending parties and interests have been in circulation for the last day or two, but there has nothing decisive been done in the matter as yet. President Baldwin, of the Justice, swears that nothing short of a complete surrender of that deed to the Alta will do him. It is to be hoped that the proprietorship of that rich little bonanza will be decided equitably and finally very soon. Meanwhile the flow of hulkion from the bonanza mines continues unabated, and showing no immediate chance for diminution. Connection is completed between the Chollar mine and the Combination shaft on the 1785-ft level, giving not only fine and much needed ventilation at that depth, but also a new and advantageous opportunity for Comstock drainage should it be required.

NATIONAL GOLD BANK AND TRUST COMPANY.—The annual meeting of this favorably-known banking corporation was held on Tuesday. President Burton submitted his report of the business for the past year. The gross earnings had been \$130,000, and the gross expenses \$33,000, making the net earnings \$97,000. Many of the old affairs of the bank had been settled and others were in a fair way of adjustment. With a continuance of present prosperity, the President was of the opinion that dividends at the rate of 9% per annum could be commenced and maintained. The Cashier's report showed the deposits for the year to have been \$33,892,373, and the amount of cash on hand on the 31st of December, was given at \$149,073. The election for Directors resulted in the unanimous choice of the following named gentlemen: I. G. Wickersham, J. O. Eldridge, Samuel Crim, H. L. Davis, Geo. L. Bradley, Wm. Blackwood, C. H. Burton, P. B. Horton, Lloyd Tevis, M. Lynch, Claus Spreckles.

BULLION SHIPMENTS.—Since our last issue shipments of hulkion from the prominent mines have been as follows: Leopard, Jan. 2d, \$8,300; Grand Prize, 2d, \$36,700; Tyler Con., Dec. 26th, \$3,870.03; on the 29th, \$7,745; Endowment, Jan. 2d, \$24,767; Northern Belle, Dec. 31st, \$2,622; Manhattan, Jan. 1st, \$3,088; Alps, 2d, \$1,497; Grand Prize, 5th, \$29,200; Tyler Con., Dec. 30th, \$3,694; Alps, Jan. 3d, \$1,507; Northern Belle, 2d, \$2,726; Arizona, 5th, \$1,386; California, 7th, \$351,300.03; Con. Virginia, 7th, \$524,743.44; Northern Belle, 5th, \$4,492.42; Standard, 6th, \$67,558.90; Grand Prize, 9th, \$30,900; Alps, 8th, \$1,747; Leopard, 7th, \$4,900.

COPPER'S MINING LAWS.—This little manual contains all the United States mining laws, and Land Office instructions, the digest of decisions, together with the forms necessary to be used in procuring title, and is convenient for every mining man. By consulting this book, mine owners and claimants will be able to avoid the payment of consultation fees for legal advice; and by having the laws and decisions before them, they may also avoid expensive litigation in many cases.

For sale by Dewey & Co., 202 Sansome street, S. F. Price, \$1.

PARTIES in Virginia City say, the triangular squabble between the Justice, Alta and Lady Washington companies will end in a consolidation of the three companies named with the Keystone, after which the four claims will be sold to two companies having a capital stock of \$10,000,000 each and 100,000 shares apiece.

TWENTY-FIVE new mines have been located in Eureka mining district since Jan. 1st.

AT LOWEST RATES.

Amusements.

GRAND OPERA HOUSE.

Mission Street. Between Third and Fourth.

M. A. KENNEDY, Acting Manager.

MISS MINNIE WALTON.

Open every evening with a first class Dramatic Company. Box office open from 9 A. M. to 10 P. M. Doors open at half past seven. Commence at eight.

CALIFORNIA THEATER.

John McCulloch, Proprietor and Manager. Barton Hill, Acting Manager.

Bush Street, above Kearny. Open every evening. THE BLACK CROOK and the Kinky Ballet. Box office open from 9 A. M. to 10 P. M. Seats may be secured six days in advance. In Preparation, JOURNEY TO THE MOON.

EMERSON'S OPERA HOUSE.

Bush Street. Between Montgomery and Kearny.

ADAM RICHMOND,

And the Opera Bouffe and Burlesque Company.

BALDWIN'S THEATER.

THOMAS MAGUIRE, Manager.

Corner Market and Powell Streets. Open every evening and Saturday matinee. Union Square theater company. Magnificent scenery; elegant appointments. Box office open daily.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

California Fruit Growing Association.

Principal place of business, San Francisco. Location of property, El Dorado County, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the seventeenth day of December, 1877, an assessment of two (\$2) dollars per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin to the Secretary, at 331 Sansome Street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the twenty-second day of January, 1878, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Saturday, the ninth day of February, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

HORACE JONES, Sec'y

Office, 331 Sansome Street, San Francisco, Cal.

South Overman Consolidated Mining Company.

Location of principal place of business, San Francisco, California. Location of works, Gold Hill, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the twenty-sixth day of December, 1877, an assessment of No. 2, of twenty-five (25) cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the company, 328 Montgomery Street, Room 21, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the twenty-eighth day of January, 1878, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the eighteenth day of February, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

DAVID WILDER, Sec'y

Office, 328 Montgomery Street, Room 21, San Francisco, Cal.

Mariposa Land and Mining Company of

California. Location of principal place of business, San Francisco, California. Location of works, Mariposa County, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the seventh day of January, 1878, an assessment of No. 13, of one (\$1) per share was levied upon the capital stock of the corporation, payable immediately in U. S. currency to the Secretary, at the office of the company, room 3, Nevada Block, No. 309 Montgomery Street, San Francisco, California, or to the Assistant Secretary, at the office, No. 9, Nassau Street, New York.

Any stock upon which this assessment shall remain unpaid on the eleventh day of February, 1878, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Tuesday, the twelfth day of March, 1878, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors.

LEANDER LEAVITT, Sec'y

Office, Room 33, Nevada Block, No. 309 Montgomery St., San Francisco, Cal.

Manzanita Gold Mining Company.

Location of principal place of business, San Francisco, Cal. Location of works, Sulphur Creek, Colusa County, Cal.

NOTICE.—There are delinquent upon the following described stock, on account of assessment No. 1, levied on the third day of December, 1877, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Certificate.	No. Shares.	Amount.
Spratt, Geo S, trustee.	46	300	\$30 00
Spratt, Geo S, trustee.	47	300	30 00
Spratt, Geo S, trustee.	48	300	30 00
Spratt, Geo S, trustee.	51	200	20 00
Spratt, Geo S, trustee.	52	200	20 00
Spratt, Geo S, trustee.	53	200	20 00
Spratt, Geo S, trustee.	54	400	40 00
Spratt, Geo S, trustee.	124	1345	134 50
Spratt, Geo S, trustee.	128	70	7 00
Spratt, Geo S, trustee.	129	65	6 50
Spratt, Joseph.	68	2900	290 00
Spratt, Joseph.	69	2000	200 00

And in accordance with law, and an order of the Board of Directors, made on the third day of December, 1877, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, on the third day of January, 1878, at the hour of two o'clock, P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. B. REYNOLDS, 320 Sansome Street.

THE O'HARRA CHLORIDIZING FURNACE

Guaranteed to Chloridize from 85 to 95 per cent. of any gold or silver ores that are not more profitable for smelting. Will also desulphurize ores and put them in proper shape for working in cupola furnaces.

Cost of Roasting and Chloridizing 20 Tons in 24 Hours by this Process:

One man.....	\$ 4 00
One man.....	3 00
Wood—2½ Cords at \$3 per cord.....	5 25
Salt—1,600 lbs at 2½ cents.....	40 00
Cost of 20 tons.....	\$52 25
Cost of one ton.....	2 61

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

The furnace is now working successfully at the Poe Con solidated Co.'s mines, in Peavine District, Nev., and at the Exchequer mill, Alpine Co., Cal. For further information, apply to

D. J. O'HARRA, Reno, Nevada.

FOR SALE.

Nine by Fifteen Inch Second Hand Varney Rock Breaker. Address "ENGINEER," Box 2361, San Francisco, Cal.

Attention, Mining Companies.

RICKARD'S PATENT

Oxidizing and Chloridizing

FURNACE,

FOR ROASTING

COPPER, SILVER & OTHER ORES

Prior to Leaching or Amalgamation.

The most striking advantages which it offers above all other recent inventions of this nature may be briefly summed up as follows:

First.—Its cheapness, the cost of its erection (ex-royalty and freight) not exceeding \$1,500, for a capacity to roast and chloridize twenty tons per day, viz: brick work, \$1,000, and iron work, including blower, \$500.

Second.—Short time required for erection, viz: 14 days, after providing all materials, with a sufficiency of labor.

Third.—No expensive, heavy or complicated machinery being necessary, involving heavy freight to the district where it may be required. Brick and clay generally obtainable on the spot, being the chief materials required in its construction.

Fourth.—No skilled labor or technical experience is necessary to work it. Two ordinary laborers being sufficient to attend to it when in full operation.

Fifth.—It does not easily get out of order, and is readily repaired by an ordinary mason or blacksmith when it does.

Sixth.—The royalty, or license to use it, is exceedingly moderate, removing thereby all temptation to evade or infringe the patent.

Seventh.—Calculating labor at \$3 per day, and wood at \$6 per cord, the cost of roasting is but little over \$1.50 per ton (ex-salt when chloridized), at these high California rates for labor and fuel.

One of them is now in the course of erection by the Aztec Gold and Silver Mining Company, at their mill in the Aztec District, Santa Rita mountains, Southern Arizona. At their office, 302 Montgomery Street, rooms 14 and 15, a model may be seen, and working drawings, with all further information necessary to enable any ordinary mason to construct the furnace, may be obtained from

To Mill and Mine Owners.

Having made arrangements with competent and reliable parties in Washington City, by which we will be able to secure prompt and careful attention to our business, we are now prepared to assist Mill and Mine, Canal and Ditch owners in securing patents for their lands, mines and claims, in addition to our former line of patent business.

Many who are acquainted with the manner in which this business has heretofore been conducted, (with or without assistance by local attorneys,) will see at once the great advantage of patronizing an establishment that is thoroughly organized and has its representatives in Washington to look after and prosecute their applications before the Commissioner of the General Land Office. The business on this Coast will be attended to by JOHN L. BOONE, Esq., Attorney-at-Law, one of the members of this firm.

Correspondence from persons desirous of securing patents for Lands, Mines, Mill Sites, Canal and Ditch property, promptly attended to.

Musical Instruments.

The firm of Kohler & Chase, of 633 and 635 Clay street in this city, is an old established and trustworthy house, dealing in pianos, organs and all other kinds of musical instruments. They are extensive importers of instruments and instruction books, and have long held an enviable position in this branch of trade. We take pleasure in recommending them to all our readers who wish to introduce the refining influences of music to their homes. The firm make a specialty of the Decker Brothers' piano, the Mason & Hamlin cabinet organ, the Emerson piano and the J. & C. Fischer upright piano. All of these instruments have gained a wide fame for excellence and won high praise from those who know best what constitutes excellence in a musical instrument.

We would speak especially at this time of the Decker Brothers' piano. We cannot do better than present a testimonial of its quality, freely given by a group of musicians whose praise will commend itself to all music lovers. During the Centennial there was held in Philadelphia a grand musical congress, at which the Decker Brothers' instruments were used, and the result was the following straightforward endorsement:

PHILADELPHIA, June 27th, 1876.
The Decker Brothers' Grand pianos, used by the Musical Congress at their grand operatic concerts and musical festivals, recently given at the American Academy of Music, were remarkable for their superior quality of tone and extraordinary power. Finer instruments we never heard. Clara Louise Kellogg, Annie Louise Cary, Zelda Seguin, Julia B. Rive, Esmeralda Cervantes, Joseph White, Max Maretzek, P. Brignoli, S. B. Mills, P. Ferranti, Franz Remmert, E. Behrens.

A matter which we would make most prominent in this connection is, that the Decker Brothers' name is the subject of attempts at counterfeiting. This is the penalty which the manufacturers of a first-class instrument have to pay for the gaining of a good name, and all our readers should be on their guard against imposition. Unprincipled parties have manufactured and sold cheap pianos under the names of "Decker," "Decker & Co.," "Decker & Brothers," "Becker Brothers," etc., doing business on the reputation and popularity of the celebrated Decker Brothers' pianos. All genuine Decker Brothers' pianos have their name in front on the pianos above the keys, viz.: Decker Brothers, New York. In all genuine Decker Brothers' square pianos the following words appear, cast upon the iron plate on the inner left-hand side of the instruments: Decker Brothers' patent, June 23, 1863.

The simplest way to guard against imposition is to deal with those who are well known to be trustworthy. Kohler & Chase have a reputation of this character established by twenty years of business experience in this city.—*Pacific Rural Press*, Nov. 1st, 1877.

The Cariboo Quartz Ledges.

We present herewith a diagram of the Bonanza and Steadman ledges, recently discovered in the Cariboo mining district, British Columbia. By referring to the diagram, the letters indicate the following claims on the Bonanza ledge: 1, British Columbia M. & W. Co.; 2, Ring Co.; 3, C. Sadow, Crown Grant; 4, Australian Co.; 5, Dunlavy Co.; 6, Pinkerton Co.; 7 and 8, Enterprise Co.; C, tunnel of the Enterprise now under way, estimated length 275 feet. This will cut the ledge 150 feet from the surface.

The work of development has commenced in earnest, and indications all point to the opening of a large and productive quartz mining region. The present government of the Province is active in promoting the development of the country, and a few months since engaged Mr. R. B. Harper, an old and experienced quartz miner, to visit the Cariboo region and give the quartz prospects a careful examination. Mr. Harper, after a careful investigation, satisfied himself of the existence of paying quartz, and under his direction tunnels were run which demonstrated beyond a doubt the correctness of his theories. The principal claims are located upon the "Big Bonanza" ledge, situated on the summit of

claim a cut has been run across the vein, showing the same character of ore found in the Cariboo. It is proposed to open the St. Lawrence by a tunnel 350 feet in length, which will cut the vein at a depth of 100 feet from the surface. The American company's claim adjoins the Cariboo on the north. An open cut has been run across the vein, showing the same kind of ore disclosed in the Cariboo and St. Lawrence. A tunnel is projected by this company which will cut the vein 150 feet from the top. The Pinkerton lies next to the American. The ledge in this location has been cut through by Lowhee creek in the Victoria shaft, at a depth of 350 feet from the croppings of the

mining in the district Mr. Harper represents to be extremely favorable. Wood is \$4 per cord and water power is abundant. Labor is plentiful. The winters in Cariboo are severe, but no more than in many elevated localities in California and Colorado where mining is carried on all the year through. The location of the Big Bonanza ledge is such as to admit of its being worked by tunnels, thus enabling the miner to deliver his ore at the mills without exposure to the weather. The Canadian trans-continental railway may now be considered a fixed fact. The road will traverse this region. Exhaustive surveys have been made, and a portion of the road, Pembina, already constructed. Barke

Elevation of ledge at this point, 1,200 feet above bed of Lowhee creek; width of ledge on the surface, 18 to 20 feet; 9 represents the location of the Lone Star Co.; 10, Pinkerton Co.; D is the Victoria gravel mining company's shaft. At a depth of 130 feet the ledge was struck in a drift and found to be 30 feet wide; assays averaging \$36 per ton; 11 is the American Co.'s ground; 12, Cariboo Quartz M. Co.; A, is the tunnel of the Cariboo, cutting the ledge 52 feet below the surface. At this point the vein is 22 feet wide, giving assays ranging from \$14 to \$155 per ton; average, \$33. No. 13, is the St. Lawrence M. Co.; 14, Wintrip Co., Crown grant; 15, Black Jack Co., Crown grant. On the Steadman ledge, No. 1 is the McKenzie Co.; 2, British Columbia M. & M. Co.; 3, S. Walker; B, croppings, assayed \$20 to \$30 per ton and worked \$13.25; ledge five feet wide. No. 5 is the Cariboo Quartz M. Co.; and 6, the Consolidated Virginia Co.

the mountain back of Barkerville. The ledge is a true fissure vein with well defined walls, and has been traced for a distance of five miles. The Cariboo Quartz M. Co.'s tunnel has cut the ledge at a distance of 52 feet from the surface. At this point the vein is 22 feet in width, with assays ranging from \$14 to \$155 to the ton. The average assays across the vein show \$33 per ton. The ore is a soft quartz, carrying free gold and sulphurets, with a slight trace of silver. A four-stamp mill, with imperfect appliances, has been busily engaged in running upon rock from this claim for most of the time since October 8th, 1877, with the most satisfactory result. The gross yield for two months to December 1st, may be put down at \$5,000. The company has decided to erect a first-class 20-stamp mill at once, and Mr. Harper is now having the plans and specifications prepared in this city. Adjoining the Cariboo claim on the south is the St. Lawrence location of 1,500 feet. In this

Cariboo location. Where exposed by the Victoria shaft it is 30 feet wide, averaging \$36 per ton in gold, with traces of silver. The British Columbia mill and mining company have decided to order a 20-stamp mill. The Enterprise mine lies next to the north of the Pinkerton, is being energetically developed and a mill will be erected. There is probably no doubt that the Big Bonanza ledge is the feeder of the famous Williams and Lowhee creeks, and the mother lode of the country. The yield from these creeks since 1862 amounts to the astounding sum of \$40,000,000. All placer gold is made up of particles and detached fragments which once formed a part of some vein, and from which they have been detached by various mechanical causes, especially by the action of currents of water. The creeks below the ledge were astonishingly rich, and it is a fair inference that this ledge was the source of the placers. The conditions for successful quartz

ville is connected with San Francisco by wire, and communication with the mines can easily be had at all time. The telegraph line to Barkerville was constructed by the Western Union Telegraph Company some years ago, when that corporation was endeavoring to build an overland line via Behring's straits to Asia. The scheme was abandoned after the Atlantic cable was successfully laid and the line as far as built turned over to the Provincial Government. Mr. Harper represents that there is great rejoicing among our neighbors over the new developments. Property has advanced in Victoria and elsewhere in the province, and British Columbia seems to have entered upon a new career of prosperity. It is a matter of great congratulation that another productive gold region has been opened, as San Francisco must feel the benefit of such discoveries in the demand for mining machinery and mining supplies of every description.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents—Eds.

The Mines of Colorado.

Facts and Figures Regarding the Gold Mines of Gilpin County.

EDITORS PRESS:—The yield of the gold and silver mines of Colorado for the year 1877 was, according to the statement of John J. Valentine, of Wells, Fargo & Co., \$7,913,540. This is in currency value, and reduced to gold value it would amount to \$7,554,692. It is by far the largest product ever obtained from the mines of this State. The largest previous yield was that of 1876, viz: \$6,191,907. For the five preceding years it was as follows: 1872, \$3,600,000; 1873, \$4,070,000; 1874, \$5,362,000; 1875, \$5,486,000. An unusual degree of prosperity prevails throughout Colorado, not only on account of general success in the mining districts, new and old, but also on account of the most bountiful crops ever known here, and of heavy sales and shipments of beef cattle to the East. For the first time in the history of this region, enough wheat and produce was raised for home consumption, with a small surplus over.

The accuracy of Wells, Fargo & Co.'s figures cannot be ascertained yet, but it is evident that they are not far out of the way. Not having obtained the exact figures from all parts of the State, I will send you the figures of Gilpin county, which I have gathered with much care and no little trouble, and whose correctness I can vouch for. As with the State, the yield of this county, which embraces the leading gold district, and the contiguous towns of Central, Black Hawk and Nevadaville, has greatly increased. The total yield of this district since its discovery in 1859 is over \$32,000,000, coin value.

The actual shipments from Central or Gilpin county in 1877, was as follows:

Gold retort from quartz mills.....	\$1,277,932.81
Gold dust from gulches.....	40,000.00
Gold from Clear Creek county.....	21,262.05
Gold and silver bars from the Boston and Colorado smelting works.....	2,056,324.56
Ore sold to Golden smelting works.....	80,000.00

Total.....\$3,475,519.42

Of the above amount, \$1,299,543.69 came from ores from other counties, treated at the Boston and Colorado smelting works, at Black Hawk, with the exception of \$21,262.05.

The following is the actual yield of the mines of Gilpin county for the year 1877:

Gold.....	\$1,931,620.15
Silver.....	161,255.36
Copper.....	82,100.20
Lead.....	1,000.00

Total.....\$2,175,975.71

The above came through the following channels:

	Tons of ore.	Yield.
Twenty-two quartz mills.....	140,700	\$1,277,932.81
Boston and Colorado smelting works.....	9,500	778,042.92
Golden smelting works.....	1,500	80,000.00
Gold dust from gulch mines.....		40,000.00
Total.....	151,700	\$2,175,975.73

* Nearly half of this tonnage was in buddled tailings from the quartz mills.

All of the figures given in this article are gold or coin value, excepting the following statement of the production of the Boston and Colorado smelting works, which are given in currency value because that was the way it was received from Profs. Hill and Walcott, managers of the company. Wherever any portion of these figures are used elsewhere in this article they are reduced to coin value, allowing an average premium of gold for the year of four and three-quarter cents.

Statement of the production of the Boston and Colorado smelting works at Black Hawk for 1877, showing the amount of the various metals produced, and the amount due to the credit of the several counties from which ore was received:

Counties.	Gold.	Silver.	Copper.	Total.
Gilpin.....	\$591,500	\$137,500	\$86,000	\$815,000
Clear Creek.....	6,500	707,000	3,000	710,500
Park.....	38,000	221,500	3,000	263,000
Boulder.....	169,000	90,500		259,500
Custer.....	14,500	70,500		91,000
Other sources.....				4,000

Total.....\$810,500 \$1,233,000 \$97,500 \$2,154,000

The hullion from these works is the finest turned out by any reducing establishment in America. The bars of silver with the stamp of these works upon them are marketable in all home and foreign ports, as they are not required to pass the New York assay office to fit them for commerce. They are shipped to the Fourth National Bank of New York, which guarantees them to Belmont, agent of the Rothschilds, or for any other purchaser. The gold is shipped in bars containing a trifle of copper, and are valued at from \$14,000 to \$24,000 each. These works were established in 1867 on a small scale. They now have over 20 furnaces, five of which are for smelting, and employ 120, men besides wood-bauers. Their total product from the beginning has exceeded \$12,250,000. Last year they treated very nearly 16,000 tons of ore, including 4,500 tons of bud-

dled quartz mills tailings, or an average of 44 tons daily for the entire year. One smelting furnace and four calciners, or roasting furnaces, were added last fall.

The stamp mills treat nearly all of the ore from the mines, which is of low grade and requires cheap treatment, in order to retain a profit. Twenty-two mills were in operation in Gilpin county last year, with a total of 665 stamps. Most of these were in operation constantly, night, day and Sundays. The average number of stamps in operation throughout the year was 597, crushing one-tenth of a cord or about three-fourths of a ton of ore every 24 hours. There were 20,100 cords treated, or allowing seven tons to a cord, 140,700 tons, and the average yield was \$74.10 per cord, or \$10.58 per ton. The average saving of the stamp mills is from 50% to 60%, and sometimes nearly 70%. The amount of silver and copper saved is small. The smelting works save 97% or more of the gold, silver and copper, and treat the high grade or picked gold ores, and such silver ores as they can buy, on the same basis of a charge of \$30 or \$35 per ton, or more in case of very rich ore. The quartz mills charge from \$18 to \$22 per cord, which amounts to the same as \$2.30 or \$3 per ton. The Briggs and Bobtail companies, who have their own mills, mine, hoist and mill their ore at a cost of \$5 per ton or less. The cost at the Kansas and Gunnell is but little more. About 1,400 men are employed in mining and milling in Gilpin county.

The yield of the Bobtail lode for the year was about \$350,000, of the Gregory and Gunnell not much less than \$250,000, and of the Monmouth, part of the Kansas, about \$120,000. The Kent County, Comstock and Burroughs, produced largely. There were 100 other mines worked, among which the Lewis, Shanks, Smith, Minnie, Omaha, Bugher and Fourth of July, have paid largely.

Lately four mines that have produced in former years nearly or quite 500,000 each were opened. They are the Alps, California, Gardner and English-Kansas. These have all been idle for years, but are now being worked on a large scale. The first is already paying, and the others soon will be. These mines will soon require 150 stamps for milling purposes, and it is thought they and the Bates, and others soon to be worked again, will swell the bullion product of the county to \$3,000,000 in 1878.

Central, Colorado, Jan. 7, 1878.

American Capital in Chilean Mines.

EDITORS PRESS:—I have special instructions from the President of Chile, Don Anibal Pinto, to do all I can to induce Americans to go out to Chile. They will be well received. The Prime Minister, Dr. Jose V. Lastarria, writes me that almost all his time is devoted to the mining interests of the country, and that these will in future have the greatest protection from the Government.

I will give letters of introduction to my brother, John Sewell, of Valparaiso, where we have a mining office at No. 102 Cochrane street, to all such desirous of going to Chile; provided they are prepared to do so, by taking some means of their own, and with expectations of being backed by rich men. Otherwise, I would advise men to remain at home. It takes about \$350 to reach Valparaiso. A great inducement is that Chile has the same climate as California, only it is less warm. In fact, there is everything to make mining profitable. We have the richest silver and copper mines in the world. Samples of silver ores I brought from Chile are very rich, and have been exhibited in San Francisco and would convince the most incredulous. They have been left for inspection at the Nevada Metallurgical Works of Messrs. Huhn & Luckhardt, No. 23 Stevenson street.

As you already know, the placer mines at Catapilco, Chile, have been sold to La Ligna G. M. Co. of New York, and they are preparing to erect large and expensive hydraulic works. From working tests the gravel deposits at Catapilco average 50 cents to the cubic yard of gravel. A 400-horse power engine will be employed to pump the waters from Catapilco lake to an elevation of 450 feet, where over 10,000,000 gallons of water will be deposited in a reservoir every 24 hours; from this reservoir two 15-inch pipes will supply four of Craig's nozzles. The sluices are to be paved or lined with old railroad iron, and all the works are to be first-class in every particular. The new company is a "close corporation," formed principally of Eastern capitalists, who have employed an experienced Californian hydraulic miner to superintend their works in Chile.

The great advantage of most of the Chilean gold diggings is their proximity to the coast, commencing a few blocks from the shore and extending back into the country some 15 miles. They are richer than most California diggings. Labor is three hits per day. Chile is the land for cheap provisions, railways, good wagon roads, etc. The diggings are situated some 30 miles to the north of the principal seaport, Valparaiso, and can be reached by a steam launch in four hours. By railway from Valparaiso and stage, the journey can be accomplished in eight hours.

When I was in Salt Lake City in September last, I was interviewed by several friends of Harry Holcombe, all desirous of starting for the Chilean diggings. I advised them to wait until I could give them positive news of the

arrival in Chile of the promoters of the two companies. These gentlemen have now returned to New York and the properties have been accepted. Mr. H. Holcombe remains in Chile as manager. Two of these Salt Lakers were ready to start for Chile, having scraped together \$1,000 a piece. I warned them that Chile was not like California for wages, if they got broke they would have to work for three hits a day. That it would be better for them to get some rich men in with them, who would give them \$2,000 each, and go out there under the condition that, if they got hold of a good property, a Californian should then be sent out to inspect, and in case of approval, send \$50,000 to \$100,000 for working on a large scale. No hydraulic work has ever been carried out in Chile; nothing but the pan. As to gold quartz mining, I never came across a Chilean gold quartz mine that had ever had hoisting works or a pump. Yet in the time of the Spaniards Chile was the greatest gold-producing country in the world.

The question then naturally arises, if Chilean diggings and gold quartz mines are richer than those of California, how is it that the rich Chilean miners of copper and silver have never attempted working either of these great industries of the country that made their fathers so fabulously rich? These industries were abandoned at the time of the war of liberation from the mother country. At that period no vessels were allowed to trade with Chile except Spanish, and all other countries were excluded from bartering their goods. Immediately after the war of independence, English vessels arrived in Chile from England and India, bringing with them goods of all classes from those two countries. These were freely offered in exchange for copper, in which the country abounded and easily mined. Money and goods were advanced by the English against copper, and therefore the natives had no inducement to go into gold mining again. This requiring machinery and great outlays to make it profitable, they took to copper mining, and have continued to this day, and are now the greatest producers of that metal, turning out 60% of all the copper produced by the world. Three hundred million dollars' worth of copper have been produced by Chile in the last 30 years.

HENRY SEWELL, M. E.

Palace Hotel, San Francisco.

A Year's Work in the Bonanza.

Annual Meeting of the Consolidated Virginia Mining Company.

The annual meeting of the Consolidated Virginia mining company was held on the 10th inst., there were 482,586 shares represented. The financial report for the year was read as follows:

RECEIPTS.	
Gross product—Yield of mine for year.....	\$13,734,019 07
Ore sales—Sundry ores sold during the year.....	68,205 38
Assaying—Received from sundry parties for assaying.....	62,424 31
Balances outstanding last annual meeting, since settled.....	35,012 79
Total.....	\$13,899,657 55

DISBURSEMENTS.	
Cash and bullion sales in hand of Superintendent in Virginia.....	\$ 10,743 80
Cash in hand in San Francisco office.....	1,353 25
Nevada Bank—Balance in hands of Bank Cashier.....	1,088,349 01
Virginia office expenses.....	3,134 45
Team account.....	1,271 20
Ore purchase.....	93,933 53
Surveying.....	700 00
Assay office expenses (Virginia).....	33,209 00
Books and stationery.....	1,574 45
Legal expenses.....	29,907 00
Advertising.....	109 50
Water.....	6,000 00
Real estate.....	1,652 00
Hoisting, balance paid above receipts.....	3,142 14
Taxes.....	282,579 33
Reduction (crushing ore).....	1,440,188 00
Interest and exchange.....	80,334 30
Bullion freight.....	48,402 19
Dividends Nos. 33 to 40 inclusive.....	8,640,000 00
C & C shaft.....	131,000 00
Bullion district.....	975,416 05
Supplies.....	391,505 87
Salaries and wages.....	615,545 50
Expenses incidental to San Francisco office.....	5,265 43
Total.....	\$13,899,657 55

The report was adopted.

The following gentlemen were elected Directors of the company: George Wallace, Sol. Heydenfeldt, Geo. R. Wells, Cornelius O'Connor and Chas. H. Fish.

E. C. Platt offered the following:

Resolved, That all matters and things, acts, contracts and agreements heretofore made and entered into, agreed upon or executed by the Board of Trustees of this company, be and the same are hereby ratified, approved and confirmed.

The adoption of the resolution was opposed by S. P. Dewey, on the ground that if the Trustees had been faithful in the performance of their duty, there was no occasion for such a resolution and if they had not been faithful their acts ought not to be glossed over.

Mr. Dewey was interrupted by calls for question, and the resolution was adopted.

Protest Filed.

The following protest was handed to the Secretary, but not read:

The undersigned protests in his own behalf and in behalf of those whose interest he represents, against the passage of any resolution or resolutions tending to confirm, ratify or approve the matter and things, acts, contracts, transactions and disbursements agreed upon or executed by the Board of Trustees of the Consolidated Virginia mining company during the past year.

S. P. DEWEY.

The meeting then adjourned. Subsequently the Trustees held a short session.

The President's Report.

The following is the report of the President: To the stockholders of the Consolidated Vir-

ginia mining company: Since the time of your meeting several changes have been made in the Board of Trustees. Flood, Mackay and O'Brien have resigned. The vacancies were filled by Messrs. George Wallace, Geo. R. Wells and Cornelius O'Connor. No dividends were paid in 1877 until May 14th, when payment was resumed and monthly dividends of \$2 per share have been paid to date. The following statement shows the total amount of bullion and when produced:

	Gold.	Silver.	Total.
1873.....	\$ 314,283 68	\$ 331,293 49	\$ 645,577 17
1874.....	2,063,433 13	2,918,045 92	4,981,478 05
1875.....	7,035,206 54	9,682,188 22	16,717,394 76
1876.....	7,878,145 36	9,279,504 11	16,657,649 47
1877.....	6,270,513 08	7,463,500 30	13,734,013 07

Grand total.....\$52,730,129 52
Dividends paid, \$35,640,000.

Again, it becomes necessary to remind non-resident stockholders that we cannot remit dividends by mail or express. The company has no Treasurer. Drafts can be drawn upon the Secretary through any bank in this city. Stockholders in Boston and New York can draw their dividends without cost or delay by having their stock issued in the name of James Coffin, Trustee. Mr. Coffin is trustee for mining stock owned by the Nevada Bank and many brokers in this city. The Traders' National Bank in New York city will pay dividends on stock standing in the name of Coffin upon presentation of certificates. The condition of the bullion market during the year made it necessary at times to retain the bullion and pay dividends by overdrafts. The item of interest on disbursements is consequently large. Your attention is respectfully called to the reports of the Superintendent and Secretary herewith submitted. CHARLES H. FISH, President.

The Superintendent's Report.

Following is from the report of Superintendent Fair:

VIRGINIA, NEV., Dec. 31st, 1877.

Mr. Chas. H. Fish—President of Consolidated Virginia Mining Company—DEAR SIR: The total quantity of ore which has been taken out from the Consolidated Virginia mine in the past year ending December 31st is 144,400-2,000 tons. The were on hand in the ore-bouses and at the mills at the beginning of the year 200-2,000 tons. There have been reduced 143,200-2,000 tons, yielding bullion of the value of \$13,734,010.07, or \$95.90 8-10 per ton—this yield being 73 3-10 per cent. of the assay value of the ore, no allowance having been made for wet ore. We have now on hand in the ore-bouses and at the mills 1,400-2,000 tons valued by assays at \$171,560. The value of the gold contained in the bullion produced was \$6,270,518.68, and of the silver, \$7,463,500.39.

All the ore extracted was taken from the 1200, 1300, 1400, 1500, 1550, 1650 and 1750-foot levels of the mine.

The 1200-Foot Level.

This level has been re-opened during the past year by running a large drift from the Gould & Curry shaft to our main shaft, a distance of 1,530 feet. To work this level we were compelled to connect with the Gould & Curry shaft for ventilation, and all the ore from this level has been taken out through that shaft. The ore-breasts on this level are very extensive, and as we rise above the sill-floor the ore widens to the east. The ore has been followed south from the ore stopes more than 175 feet.

The 1300-Foot Level.

Considerable work has been done on this level in crosscutting the ore body, and much ore of fair quality has been developed. Much more exploration will have to be made, however, to obtain a definite knowledge of the extent and value of the ore which yet remains in place.

The 1400-Foot Level.

From this level a very large quantity of high-grade ore has been extracted during the year, and a vast quantity yet remains in place. The work of extracting ore from this level has heretofore been attended with much difficulty, owing to the crushing of the ore stopes by the pressure from the east, and from the waters which accumulated in large cavities in the rock east of the ore body. This water has frequently broken in through the east clay, flooding the stopes, and doing great damage and causing many delays. All this trouble is now ended, as the water is now drawn away through the drift on the 1500-foot level—run from the C & C joint shaft. In addition to the ore which has heretofore been worked on this level, a body of ore 60 feet in width has been developed to the west. It is of high grade, and how far it may extend south and upward is unknown. From all indications it promises to be extensive.

The 1500-Foot Level.

On this level a drift has been run south from the main shaft 200 feet, and connected with the east stopes. A lateral drift has been run south, on the west side of and adjoining the ore stopes. From this lateral drift raises have been made, connecting with the level above, for air and for ore chutes. Considerable ore has been encountered in extending these openings.

The 1550-Foot Level.

A large quantity of ore has been extracted from the southern part of the ore body on this level, and the end of the body in that direction has not been reached. Work on the ore-breasts here was discontinued several months ago on account of had ventilation. A large working drift and air gallery has just been completed,

Continued on page 39.

MECHANICAL PROGRESS.

Thimble Making.

This is an interesting piece of mechanics' work which we do not remember to have seen described before. We are indebted to a writer in the *Polytechnic Review* for the following facts: To make a silver thimble we will say that a trade dollar is taken. (Half-dollars are not so pure.) It is rolled out rather longer and thinner; a planchet is cut out by a fly press. A punching press next upsets it (just as making metallic cartridge cases) into a cylindrical cup. As silver is not as ductile as copper, it is then annealed. A second punch works it out into a cup; a second annealing prepares it for a tapered punch, which makes of it a conical cup. Being chucked in a lathe on a steel cone, a cutting wheel on the end of a lever turns off the burr end; a hook tool on a lever turns back the rim, and a grooved wheel rounds it. (Very wide rims are hard-soldered on.) A diamond-pointed tool turns off the end and sides and an oiled steel tool polishes the newly turned surface. Next a knurling tool—a narrow rimmed wheel on a suitable handle—indents one ring at a time the concentric rings of pits in the end; the noise produced by this tool being somewhat in a gamut, the outer circle producing quicker vibrations and hence higher tones. A side knurler with beveled fan and with several rows of projections produces the side indentations; an inside tool is used, if the thimble be very thin, to smooth out the projections caused by the knurling. These pits could not well (as one might imagine) be stamped in, as this process fails to give the required sharpness of outlines; furthermore it would make the ridges less dense than the bottoms of the hollows, and hence more likely to wear away quickly. A cording wheel makes a rope-like fillet, and other varieties of knurling wheels produce "matt" surface, bead-fillets, etc. Some establishments solder on the tips, but it is claimed that this is not as substantial as striking up from the solid. Other ornamentation than that of the lathe may be given by what is called *chasing*, dull-edged chisels being worked along by a twist of the wrist, so as to produce broken lines, diagonal or otherwise. After boiling in soap-suds to remove the oil, the thimbles are brushed, and are then ready for the market. Gold thimbles cannot be punched from the planchet by the same press that "draws" the silver ones, but the blanks are drawn in a hand-fly press. They must be more accurately made than the silver, as they must not vary a weight more than a very few grains to the dozen.

Oven Builders.

There are few vocations of such a distressing character as that of the oven builder. At the best of times, when he is engaged in building a new oven and is not subjected to the intense heat that usually accompanies operations in one already constructed, he is compelled to work in a painfully constrained position, and this is rendered more intolerable when having to replace broken tile or repair a fissure in the roof, he is obliged, by the exigencies of the baker's business, which will not permit him to let his oven stand several days to cool, to perform the job in a condition of temperature that to ordinary persons would be unendurable. In operations of this nature oven builders always work in couples. Placing a flour sack rolled up at the mouth of the oven, the workman crawls into the chasm on his stomach, unfolds flat before him, and then, resting upon it, wriggles himself or is pushed into the place where the repair has to be effected, while his comrade, standing at the door, ready to pull him out should he be overcome by the heat, hands in the tools as he requires them. Great care has to be exercised in using the latter. If left in the oven long they become too hot to handle, and in consequence, together with the mortar and other repairing material, are always kept outside until actually needed. After working about five minutes the signal is given, and the man hauled out by the heels, throws himself upon the dough-board, where a sort of bed of flour sacks has been improvised for the occasion. Among these he buries himself to prevent his catching cold, and for a few moments his writhings alone testify the stress of suffering to which he has been subjected. The effect of the heat is more appreciated when, on emerging from the sacks to refresh himself in a copious draft of beer, his clothes are found to be literally dripping with perspiration. The wonder is that men should be found willing to devote themselves to such a business as this, but the wages are high, and, in spite of the suffering the work entails, as much competition exists in the oven building trade as in other walks of life.

A "TOLLING" MACHINE.—In the current number of *Fors Clavigera*, Mr. Ruskin gives the following note from a correspondent: "Here's a good thing for 'Fors.' A tolling-machine has been erected at Ealing cemetery at the cost of £80, and seems to give universal satisfaction. It was calculated that this method of doing things would (at 300 funerals a year) be in the long run cheaper than paying a man threepence an hour to ring the bell. Thus we mourn for the departed!"

A Premium for Inventors.

We notice that the people of South Australia are thinking of offering a premium of \$20,000 for a combined machine which will reap, thresh and sack their grain. This problem has already been attacked by California inventors and with considerable success and we hope that the premium will be decided upon and fall into the hands of a Californian. To give all notice of the possible chance for their inventive skill we quote from the *Adelaide Observer*, just received, as follows:

"The experience of the past year has shown that South Australia will have much greater difficulty than has hitherto been the case in competing successfully for the breakfast supply of the English markets. Transit has now become so rapid and so cheap that other countries, such as India and America, which annually produce a large surplus of grain, are able, from their geographical position, and the cheap rate at which they can grow wheat to send off their abundance to Europe at a price that it is almost hopeless for us under present circumstances, to attempt to rival. We are glad, therefore, to notice that Mr. Darling has brought before the House the question of the desirability of offering a government bonus for the invention of the best machine for reaping, cleaning and bagging wheat on the ground. As pointed out by him, the winnowing and bagging of the wheat at present is really the most costly part of the harvest operations, as it takes at least two men to manage a winnower, whereas but one is required for a reaper. He considers that if one machine did the whole of the work two men in place of three would be required, the result being the saving of about £70,000 on the harvest throughout the colony, and the setting free of a number of men for other occupations whenever their services are much wanted. Nor would it appear that such a machine is in any way an impossibility, as something of the kind has already been invented and tried in the colony. There can be no question that when a perfect combined reaper, thresher and cleaner is constructed its value to the colony will be cheaply gained by the expenditure of £4,000. We trust, therefore, that the motion of the bonus will be assented to, and that the money will be speedily claimed."

ONE-LEGGED RAILWAY.—An Oil City *Derrick* correspondent describes the elevated one-wheeled, or, as it is more generally known, "one-legged railroad," now being constructed by Gen. Stone in the Bradford oil region. It is attracting a good deal of attention, and there is much speculation as to the probable success or failure of the enterprise. A portion of the line between Bradford and Tarpot is completed, and one car of peculiar construction has arrived and been placed on the track. The construction of the road is simple, rapid and easy. On the hard ground, logs six feet long and from a foot and a half to two feet in diameter are placed at right angles to the line, and from 12 to 15 feet apart, the distance varying. In these logs vertical sawed posts, 14 by 15½ inches, are dovetailed and wedged. These verticals vary in height, and by their length the grade of the road is regulated. On the top of these verticals the horizontal pieces to which the rails are spiked are laid, with their ends squarely against one another. These sleepers are 10 inches wide by 15½ in thickness. By a proper arrangement of vertical and horizontal pieces of timber the timbers on which the rails are laid are kept firmly in position, and two wooden rails, three feet and a half below the top of the iron rail and 22 inches apart, are spiked to the vertical posts. Across streams and the swampy ground piles are driven. On this one rail a saddle-shaped car is mounted and supported by two wheels, double flanges. The gondola car now mounted on the portion of the road completed is 22 feet long, nine feet wide, and weighs over 7,000 pounds. The car is a double-decker, there being room for freight in the body of the car, and on each side of the saddle. Twenty-two inches below a plane tangent to the upper wheels, at the lowest point of their circumference, four smaller wheels are placed in a horizontal position, and in the same plane, their circumferences being 22 inches apart. These run against the wooden guide rails, and keep the car in position. The wheels are attached to standards connected with the iron framework of the car.

AMERICAN CARS IN ENGLAND.—Our London exchange, *Iron*, says: The teaching of the accident to the Scotch express on Tuesday last, would appear to be that one should always travel in the middle of the train, and, if possible, in a Pullman car. Several persons were more or less severely injured, but those in the two Pullman cars, "Australia" and "Midland," were quite uninjured. Those passengers who were sleeping in the "Australia" were not, indeed, aware that any accident had happened until the train came to a standstill and they were awakened to a sense of the danger they had gone through. It must be recollected that the accident was a severe one, the engine having left the rails and plowed the earth for nearly 300 yards, smashing rails and sleepers alike. Everybody seems to have been more or less shaken and otherwise hurt, except the fortunate occupants of the Pullman cars.

SCIENTIFIC PROGRESS.

The North America Unionides.

EDITORS PRESS:—At the recent meeting of the Washington Philosophical Society in this city, Dr. C. A. White, paleontologist of the Hayden Geological Survey, delivered a short address on some phases in the evolutionary history of the North American Unionides.

He commenced by a comparison of the Unionides of North America with those of other parts of the world, showing that the types in which their variation is expressed are not only numerous and varied, but many of them are peculiar to North American waters. The greater part of these types, which coneobiologists in all parts of the world recognize as North American, are found only in the great Mississippi river system and in the Red-river-of-the-North. Then giving a table of the mesozoic and cenozoic formations of western North America on the blackboard, he explained that collections of fossil Unionides have been made from nearly all the mesozoic and all the cenozoic formations of the great Rocky mountain region; their abundance increasing with advancing time. All the species are different from any of those now living, but they are all so similar in type as to leave no doubt that the fossil forms represent the living ones ancestrally. Some of these fossil Unios, especially the earlier ones, are found in layers of formations that contain marine forms with few or no other exceptions, but they have been mostly obtained from the great lacustrine deposits of the tertiary and late cretaceous periods.

The great Laramie group, representing the closing epoch of the cretaceous, or the commencing one of the tertiary period, has proved to be especially rich in fossil Unios of North American type. This great group of strata, reaching a maximum thickness of 3,500 feet, was deposited mainly in brackish waters, as evidenced by the following facts: 1st. The absence of true marine forms, but the presence of *Ostrea* and *Anomia* throughout the whole thickness of the formation. 2d. The common occurrence of the genera *Corbula*, *Corbicula* and *Neritina*. 3d. The presence but more restricted range of the genera *Goniobasis*, *Viviparus*, *Sphaerium* and *Unio*. Those of the third category are occasionally found alone, but usually associated with those of the second, and not unfrequently with those of the first also; and so associated as to make it evident that they all lived and thrived together in the same waters. The abundant and almost constant presence of the *Ostreidae* gives satisfactory proof that the waters were, in at least some degree, saline.

Dr. White advanced the idea that although the Unionides may now be found only in purely fresh waters, the great and varied differentiation of these ancient representatives of the family probably took place under the influence of the salt in the waters in which they lived; and that the family, once having impressed upon it these types, they have been hereditarily preserved through extraordinary vicissitudes of environment to the present day, and therefore did not originate in the waters where they now exist.

The history of these North American types of Unio antedates that of the Rocky mountains, for the strata in which they are found have been displaced by the movements that resulted in the elevation of those mountains. They have witnessed, so to speak, the origin and extinction of those wonderful families of vertebrates, of that great region, which have been made known by the labors of Marsh, Cope and Leidy. When the continent was gradually emerging from the sea, a large portion of what is now western North America was almost or wholly enclosed by the rising land and cut off from the open ocean. Thus a great, brackish, inland sea was formed, hundreds of miles across, in which the strata of the Laramie group was deposited. This sea finally became entirely fresh, when the strata of the Wasatch, Green river and Bridger groups were deposited. By further movements of the earth's crust and the action of denuding forces, these great lakes became entirely drained. Some of the streams that now constitute portions of the Mississippi and northern Red river drainage systems, were doubtless channels of drainage overflow of those ancient lakes; and through these, by an unbroken line of hereditary descent, the Unionides of North American types have reached their present habitats.

Washington, D. C., Dec., 31st.

Gallium.

This element of recent discovery, was the subject of a paper before the English Chemical Society by the distinguished chemist Prof. Odling. He says: Gallium was discovered by Boisbaudran, 27-29th, August, 1875. It was first obtained in the metallic state in November, 1875. Spectrum consists of two bands in the violet; one brilliant, of wave-length 417, and a feeble band, of wave-length 403.3. It was extracted in the first instance from zinc blende of Pierrefitte, a mine in the Pyrenees, afterwards from a black blende of Bensberg on

the Rhine; the latter contains one part in 100,000, the former one in 400,000; 0.65 grammes of gallium being obtained from 430 kilogrammes of Pierrefitte blende. In appearance it resembles lead, but is less blue, tarnishes slightly on exposure to moist air, it is slightly harder than lead, flexible, malleable, and can be cut with a knife. It is not appreciably volatile at a red heat and is but slightly attacked by oxygen at that temperature. Its specific gravity is 5.9; when fused, 6.08. It melts at 30.15 C., presenting a brilliantly white appearance; when once fused it remains liquid, even for several months, at 0° C., but is immediately solidified when in this condition by contact with solid gallium. In consequence of this curious phenomenon of surfusion, the element was at first described as a liquid metal. Crystallizes in square octohedra. In properties it is more or less intermediate between aluminium and indium. The solutions of its salts give the following reactions: With ammonia: a white gelatinous precipitate, soluble, but not freely, in excess. Potash: a similar precipitate, soluble in excess. Acetate of ammonia, on boiling in a solution avoiding excess of acid precipitates a basic compound. Carbonate of baryta easily precipitates the salts of gallium in the cold. The salts already prepared are the sulphate, which is very soluble but not deliquescent; the chloride, very soluble and very deliquescent, decomposed by a large excess of water, and the alum; a solution of the latter on heating deposits a basic sulphate, which goes up again on cooling.

The Government Geographical Survey.

The various parties engaged in field work during the past summer under Lieut. G. M. Wheeler's corps of Engineers in charge of the geographical surveys west of the 100th meridian, have returned to this city, and have already commenced the preparation of their reports from the extensive notes and observations made in Colorado, Texas, Nevada, California, Oregon, and the Territories of New Mexico, Utah, Wyoming, Idaho and Montana. The work during the past season has been a continuation of its topographical work of the previous year, and the notes thus far made will enable the parties to prepare a detailed map covering an area of about 30,000 square miles. On account of the favorable season and increased strength of the parties, the explorations of 1877 have been more successful than during any previous year. A new feature of the survey will be a report upon the quantity of arable, arid, timber, grazing and mineral lands examined during the season. Geological and zoological examinations were also made in various sections. A special party made a careful survey of the Comstock lode, both above and below the ground. A map of the surface has been furnished, and a profile of the mining lodes, with plans of the separate levels, and a general longitudinal section of the entire vein, have been commenced. It is proposed to continue this branch of the survey until a complete history of the mining operations at this locality, especially, shall be completed, including the underground examination of all the various openings by shafts, and especially the Suto tunnel, now nearly completed. The party which was engaged near Lake Tahoe has completed data for a special map of this interesting lake region. The number of main and secondary triangulation and other stations occupied exceeded that of any previous year. A temporary field office has been established at Ogden, Utah Territory. Volume 4 (Paleontology) has been issued, and volume 2 (Astronomy) will soon be ready. A number of maps have been issued during the year, which have been found to be of great use, not only to the Government, but to those seeking homesteads on the Western frontier. Following are the names of officers who were in charge of the parties: Lieuts. Bergland, Tillman, Symons and Young, of the Engineer corps; Lieuts. Bornie, Morrison and Macomb, of the army. Among civilian assistants were Profs. J. A. Church, A. R. Conkling and Dr. Kaupf.

WINGED PHYLLOXERA.—The *Comptes-rendus* of the Academy of Sciences contain a notice of M. Boiteau's most recent observations on the phylloxera. The winged insects among them are this year especially numerous, and, whatever people may say to the contrary, are capable of a sustained flight, as anyone may witness on a bright afternoon in summer by placing himself near the infested vines, with the sun shining in his face. The flight of the myriads of insects playing around will be found to be regular, continuous and rapid, and the capture of some of these by the hand will prove that nearly all of them are phylloxeras. M. Boiteau has also found quantities of winter eggs, the very existence of which is still denied by many observers, and, so far as his opportunities of research have extended, it seems probable that they are deposited exclusively on the external part of the stocks.

AMERICAN PROGRESS IN SCIENCE.—The *Chemical News*, London, warmly praises the exertions made by the local and general governments of the United States for the advancement and diffusion of science, and calls especial attention to the fact that the Massachusetts Institute of Technology has provided special laboratories for the instruction of women in chemistry—analytical, industrial, and physiological; in botany, mineralogy, microscopic manipulation, etc.; and it gives credit for the work done in this department by the ladies.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

AMADOR.

GROUND SLUICING.—Amador *Dispatch*, Jan. 12: The work of ground sluicing was commenced by some parties on the flat, in Walker's ranch, between Jackson and the Gate, a few days ago. It is thought that this ground will pay from \$6 to \$10 per day to the hand.

THE MONTERICHARD MILL.—We understand that the work of laying the foundation for the new ten-stamp mill at the Monterichard mine was commenced last Wednesday. The engine, boiler and other machinery are already on the ground.

IRON PIPE.—A large amount of new iron pipe passed through town last Wednesday, which is to be used in conveying water to the old Moore mine for the purpose of running the new hydraulic hoisting works now being put up by Messrs. Hewitt & Hill.

PHENIX.—Amador *Ledger*, Jan. 12: The ice king relaxed his grasp of the Phenix stamps on Monday, so that the 80 stamps are now crushing ore. The management of both mill and mine, in the judgment of mining experts, could not be better. The gravel claim at Humbug hill, between the Kennedy and Oneida mines, owned by James Meehan and others, is being fitted up for hydraulicing. The iron pipe from Sharp & Boxall's claim is being moved on the ground. No clean-up of the Kennedy has been made yet; but reports are circulated that the plates are looking well, and the stockholders feel greatly encouraged.

NEWTON COPPER MINE.—Everything around these works appears to be moving along prosperously, with the exception that the underground operations are at a standstill, pending the disposal of the large quantities of low-grade ore which have already passed through the roasting process, and are now awaiting precipitation. The steam elevator and car track, just completed at a cost of several thousand dollars, are in daily operation, and answers admirably. The Superintendent informs us that there are 8,000 tons of ore above ground. To extract the metal from this pile will occupy until the opening of spring, at which time underground work will be resumed.

BACHELOR GRAVEL CLAIM.—On Saturday last we paid a visit to the Bachelor gravel claim, half a mile south of the Lone toll road. W. P. Hays and other parties interested are putting the claim in working trim at no little outlay in money and labor. There is undoubtedly an auriferous channel in the vicinity, as demonstrated by a tunnel driven into the hill 150 feet or more. The gravel in places looks very rich, and we are told that it prospects fairly throughout. Sluice boxes are in position, and all that is now required to set the mine in full blast is a supply of liquid from the canal. The connecting ditch is progressing at a satisfactory rate, also a reservoir. In a week or so the claim ought to be in working order. The mine, as its name implies, is isolated and lonely. There is neither a quartz nor a gravel claim within a radius of miles. The owners are plucky in opening it up in so thorough a manner; but they know what they are about, and expect ample compensation in future.

INYO.
EMIGRANT.—Coso *Mining News*, Jan. 12: We learn from Mr. Peter Taylor, who came in from Lee district last Thursday, that the ice blockade has been raised and the mill is running as usual. Regular shipments of bullion will be made for some time, as, on his return he found a large amount of first-class ore on the dumps of the mine that had been extracted during his absence by his very efficient foreman, Mr. Gomer Jones. In fact, so much ore is now in sight that the labor of a number of men who were employed in exploration has been dispensed with, and the profits to accrue from reduction of ore on dumps and in sight will considerably exceed any run heretofore made.

NEW COSO.—Another assessment of 50 cents has been levied by the New Coso M. Co. This assessment, together with the amount of ore extracted and in sight, will probably place the mines of the company on a paying basis. There are about 1,500 tons of ore on the dumps, which are daily being added to, besides a large supply of coal and wood.

NEVADA.

THE SCARCITY OF WATER.—San Juan *Times*, Jan. 10: The ditches are all frozen up, and the miners are all idle. Nearly all the wells in town have given out, and the water companies that supply the town with Adam's ale are out of the article.

BLUE TENT.—Nevada *Gazette*, Jan. 12: The Blue Tent Gravel M. Co. commenced washing yesterday with about 500 inches of water. They need two or three times as much more to work their claims as they would like to.

THE SMITH MINE.—The quartz mine situated on Wood's ravine, known as the Smith mine, is as good a mine as there is in the country for the size of the ledge. They sunk an incline to the depth of about 40 feet, and struck a ledge four feet thick. It is very thickly sulphuretted and pays \$50 per ton, which is splendid paying rock. The only power they have is a hurdy-gurdy wheel, but they intend erecting machinery on the mine in a few months, which will

enable them to take out more rock. Only pocket ledges have been found on Wood's ravine, and no ledge would average the same amount to every ton as this ledge. Mr. Smith has been working on this ledge for the last six years, but has not had the luck to strike it so rich before. This will encourage many miners in that vicinity to work their mines.

ROCKY BAR.—Grass Valley *Union*, Jan. 15: The new company are running through their first crushing of rock of over 150 loads. A full clean-up has not been made, but the plates show splendidly in amalgam, and it is expected the result will be upwards of \$3,000, or \$50 per load. The company have let a contract to sink a new incline on the ledge, and the hoisting works on the Inkerman mine have been purchased and will be removed and erected over the new shaft. This work will be pushed as rapidly as circumstances will permit.

CENTENIAL.—The appearance of this mine has not been encouraging for months, as the ledge on the foot-wall was small and not very good. Superintendent Trenberth finally came to the conclusion that they were not running on the true ledge, and went into the hanging wall, when he found a 14-inch ledge that looks splendid. On Saturday, 18 car loads of this rock were taken out, which will yield \$30 to the car, or over \$100 to the load. The faces of Centennial shareholders were looking bright and jovial yesterday at this fortunate turn in the affairs of the mine, and their hopes were strong that the strike is to be one that will last. The Centennial has been a good little mine for the district; and although not remunerative to the stockholders (having declared but one dividend) it has, within the past 18 months, taken out and disbursed to miners and business men in Grass Valley over \$90,000. This has been from the product of the mine, without any assessment, and although the company has not always been encouraged with the outlook, they have persevered, and it looks now as if they were about to be rewarded for their pluck and persistence.

PLACER.

IOWA HILL.—Cor. Dutch Flat *Forum*, Jan. 10: At all points of our hydraulic section more than usual preparations have been made for washing, in anticipation of a wet season, and all claims are now in perfect readiness for the long and anxiously looked for rain; in fact, it is said preparations on so large and extensive a scale were never made before.

The most prominent item in mining is the blast at the Morning Star claim. I never before saw so much dirt thoroughly loosened up by three tons of powder.

DEKRUSE has run a somewhat long tunnel and tapped his pay dirt at another point, so that he can now run two pipes in winter and drift in summer. This advantage raises the claim to the first-class.

JONES & HODGES are opening some new ground at Bird's Flat, belonging to the former, with every prospect of good pay, and I hear a rumor that the great Sugar Loaf claim will certainly be put under the pipe if there is hereafter a prospect of three months' water. These are the only new things of the season in the hydraulic world.

The Enterprise has also made considerable improvements, and will now work to greater advantage than heretofore, both in the amount of dirt washed and the amount of gold saved.

GRIZZLY FLAT.—Stuart & Co. have gone into the old Vigilance ground, and are getting prospects as high as \$1.50 to the pan. Fred Hazelroth has also re-opened the old Cement Knob tunnel, connecting with the southern end of his own ground, and is getting fine prospects. Headline & Co., running in unexplored ground to the north, are carrying good prospects of fine gold, and expect to do much better when they reach the rim rock. Gus Hazelroth, after nearly two years hard work, is about breaking through into the old channel, and according to past evidences cannot fail to do well hereafter. Thus when we get the old Rough and Ready again in full blast by the Sunny South men, we have solid promises of good times next summer. In connection with the hydraulic mining, I ought to especially mention the Homan claim at Prospect hill. Great improvements to facilitate good work have been made here, and the claim to-day for its admirable fixing up has no superior in the district.

SIERRA.

WATER.—Mountain *Messenger*, Jan. 12: The Bald Mountain mine had about half a head of water on Tuesday. Very few men are now employed in the claim as the dumps are all full.

STRUCK GRAVEL.—The North Fork M. Co., of Forrest City, have at last struck gravel in their tunnel, and rich gravel, too, gold being visible to the naked eye in the dirt. The gravel comes in from the top of the tunnel, which is evidence that they are low enough this time.

FORREST CITY.—Our burg has been more quiet for the past two months than ever before since the Bald Mountain commenced taking out pay. Everything around the mines is full of dirt, and men are employed on the dumps scratching the dirt away from the rack to make room for a few more loads. The North Fork is, at last, in splendid looking gravel showing some gold, but their dump is full to overflowing with hedrock taken out in running their tunnel, and they will have to shut down soon if something does not turn up in the shape of water. The hotels are full of men waiting patiently for a chance to pay for the grub they are devouring, and the hotel-keepers are waiting as patiently

as they can for them to do so. The future of our part of the county looks very bright nevertheless, as almost every prospecting claim within five miles of this place has struck good pay. Before Bald Mountain gold gave an impetus to prospecting little could be done, while the present indications are that in a year at farthest we will have a dozen new mines paying dividends.

GOOD ROCK.—The men working in Ned Leonard's ledge, have struck some splendid rock, showing free gold. They are getting ready to take out ore for crushing. If our mines were owned at home, worked by white men, and the money taken out was employed in hunting for more mines, instead of being shipped to San Francisco for direct or indirect investment in stock gambling, the miners of California would be the most prosperous people in the world.

TRINITY.

QUARTZ MINES.—Peoples' *Cause*, Jan. 10: From H. E. Willey, an experienced and well-known miner of Lewiston, Trinity county, who has been superintending a hydraulic claim for the last seven years, and is now owner of two promising quartz claims, one in Trinity county, the other in Shasta county, we learn that the lively mining town of Lewiston has become somewhat famous from the finding of a number of rich quartz ledges. It is within the last two years only that this fortunate discovery has been thoroughly demonstrated. Many of the claims are now commencing to show handsome returns to their lucky possessors. Mr. Willey feels very sanguine as to the future of these northern bonanzas. Want of proper machinery as well as capital seems to be the only drawback which the fortunate locators have been contending with in the past. But lately these difficulties have been removed, and, in all probability, next summer, very rich returns will be the reward of the persevering citizens of Trinity county. Mr. Willey spoke encouragingly of the several new enterprises which are now being opened up in the vicinity of Lewiston.

TUOLUMNE.

OHIO MINE.—Union *Democrat*, Jan. 12: On Tuesday, the vertical shaft in the mine ran into a vein, a foot and a half wide, that pays \$30 to the ton. The supply of water having increased, the mill will be put in motion for crushing ore next week.

SNOW MELTING.—We learn that since the rain of Monday, the snow in the mountains has been rapidly melted, filling the ditches and reservoirs. Whether there is enough to do much good to the miners yet is doubtful. The melting of the snow this early in the season is not a very good showing for its continuance late into the dry season, and therefore not an extremely good outlook for the mining interests in the summer.

THEY ARE IN EARNEST.—The miners' league appear to have no disposition to limit their movement to mere words. We understand that several claims have been located in ranches known to contain mineral, which will probably be contested by the ranchers. These are to be used as test cases and every member of the league stands morally bound to assist the locators of these mining claims. It will be seen shortly whether the league has the power to enter patented lands or not. The plea relied upon is that the patents have been obtained through fraud and false swearing, thereby defrauding the United States. If this point be proven, there is no doubt that the agricultural patents will be revoked.

Nevada.

BRISTOL DISTRICT.

THE DAY MINE.—A visit to the Day mine, on Sunday, disclosed the fact that work is going on there pretty lively. Forty additional men have been placed to work; in fact, every idle man around Royal had a chance to work if he wished. The ledge from the discovery cut had been stripped on top a distance of 150 feet, and ore was being taken from the cut at a rapid rate. Teams were hauling away ore as fast as possible and there are thousands of tons there yet for them to haul.

MAYFLOWER.—The straightening of the incline has been completed and drift started north from the bottom. It is now 40 feet in good ore. Opposite to this, in the south side of the incline, a drift has been started south. It is in 12 feet. Average assay from face, \$147.63. In straightening the incline, some very rich chloride ore has been found in what was supposed previously to be the foot-wall.

CORNUCOPIA DISTRICT.

HUSSEY.—Virginia *Enterprise*, Jan. 15: The Hussey mine is a coming bonanza. From the 120-ft level to the 540-ft level there is a continuous ledge, 16 feet wide, of \$120 ore, and thousands of tons are exposed in the various levels, winzes and crosscuts.

SILVER QUEEN.—Cor. *Times-Review*, Jan. 12: A rich strike has been made in the Silver Queen, at a depth of 100 feet. The letter says further that the Mountain Laurel looks better and better and that the mines of Bull Run are full of promise.

ELY DISTRICT.

PIOCHE BULLION.—Pioche *Record*, Jan. 12: \$18,293.03 in bullion was shipped during the past week, according to reports of Superintendents.

TWENTY-STAMP MILL.—In consequence of the Day mine developing such an immense amount of ore in the discovery cut, the 20-stamp Ray-

mond & Ely mill will be started to work on it next week.

JUNCTION MINE.—Messrs. James & Hale are pushing work ahead on this mine vigorously; commenced sacking ore on Monday last; vein, two feet wide. This mine is the mine reported adversely upon by Prof. Price.

BAY STATE.—Contract has just been let to sink the incline 50 feet deeper. The late work in the bottom shows the vein to be wider and richer than above. Average assay from a width one and a half feet of the bottom gave \$219 per ton. The full size of the incline is in ore.

RAYMOND & ELY.—Still continue drifting in the winze, the water holding about the same.

GREAT EASTERN.—The shaft has been finished and the whim is being erected. The coming week expect to take out ore.

ALPS COMPANY.—This company shipped in the month of December, for 20 days' run, \$29,027 in bullion; also for week ending Friday, January 11th, \$9,055. Mill has been running on second-class and custom ore for past week, in order to allow the development on and below 11th level to be properly opened. The milling of first-class ore will be resumed on Monday.

The winze running down below 11th has been sunk 45 feet, in splendid ore all the way; work on it being pushed with eight-hour shifts. The Superintendent informs us that it will reach 12th level within 15 days, when drift will be started east to connect with west drift now being run from main shaft.

EUREKA DISTRICT.

MINING ITEMS.—Eureka *Sentinel*, Jan. 11: The average daily shipments of crude bullion amount to 80 tons.

EIGHT cars of crude hullion were shipped to Palisade yesterday.

CONSIDERABLE quantities of flue dust are being shipped to Sacramento, and more would go forward if the railroad company could furnish cars.

ONE hundred and seventy-two tons of ore from the Richmond mine yielded 48 tons of crude hullion, worth a trifle over \$300 a ton.

OVER 1,000 tons of lead are stacked up at the Richmond reduction works.

LOCKWOOD & REMINGTON yesterday shipped an additional load of mining tools to Danville district.

The Richmond company are not shipping either crude hullion or refined lead at present.

THE Connolly mine is turning out and shipping to the Richmond furnaces 10 tons of ore daily.

WORK is suspended at the Bald Eagle mine for the present, awaiting advices from New York.

MAJOR McCoy has struck a fine body of ore in his mine on McCoy hill, at the depth of 200 feet.

MESSRS. WALSH & TAYLOR will sink a shaft to the depth of 100 feet in the Admiral mine on McCoy hill.

THE average cost of extracting and smelting a ton of ore in Eureka district is from \$35 to \$38 per ton.

SURVEYOR WESCOATT has finished a glass model of the Eureka Con. and Richmond mines, for the use of the Richmond company. It is a *fac simile* of ore sent to London some two months ago.

LATE improvements in the method of charging the furnaces of the Richmond works has reduced the percentage of loss in the item of flue dust nearly one-third.

NUMEROUS cars, loaded with flue dust and bullion, are side-tracked in the depot yard.

THE K. K. Con. furnace will start up on the 25th instant. The repairs to it are nearly completed.

A RAILROAD team, loaded with 30,000 pounds of freight, left for Tyho this morning.

WORK is progressing finely at the Hoosac. Both sinking and drifting is going forward.

LEWIS DISTRICT.

EAGLE.—Reese *River Reveille*, Jan. 11: We have information to the effect that the Eagle Co.'s mill was started up at Lewis district on Monday last, and that the mill and the White furnace, recently added to it, are doing good work. The same authority states that Wells, Fargo & Co. have established an office at Lewis, with W. F. Mills as their agent.

MIAMI DISTRICT.

PROSPECTS.—Pioche *Record*, Jan. 12: S. R. Nichols, Recorder of Miami district, arrived in town, Thursday evening, and reports things in that locality as being in a very healthy condition indeed, the mines turning out beyond expectations and new and valuable discoveries are being continually made. Teams, loaded with 15 tons of ore, was to leave the mines for Pioche, Friday morning, and will probably arrive some time during Sunday. This ore is from the Lily May mine, and was simply taken out as a "grub stake." The miners anticipate a lively time at this district during the coming spring.

TUSCARORA DISTRICT.

THE MINES.—Virginia *Enterprise*, Jan. 10: Prof. W. Frank Stewart, who arrived here yesterday morning from Tuscarora, last evening showed us some very fine specimens of ore from the Grand Prize and other mines in the district named. From the Grand Prize he has a variety of specimens, from black sulphuret that will assay \$8,000 to \$15,000 up to wires of pure silver. From this one mine he has sulphuret of silver, ruby silver, pure horn silver, staphanite and native silver in flakes and wires.

This lead, which began as a mere streak at

the surface, is at the depth at present attained over eight feet in width, and its width is steadily increasing as it is followed down. It is a razor-blade ledge, and lies on its back. It is said that in sinking on it the assays for the first 30 feet were but \$3 or \$4 per ton.

The Professor has made a considerable number of locations in the district on very promising veins, but as yet has sunk on none of them to any great depth.

THERE are eight steam hoisting works in operation in the district, and the town presents quite a lively appearance. There will be great activity next spring as regards prospecting and all other mining operations. Prof. Stewart will leave here in a few days for San Francisco. He has great faith in the future prosperity of Tuscarora—says that outside of this place it is the best mining camp in the State.

HORNET.—*Times-Review*, Jan. 12: The Hornet company having arranged their financial complications will resume work at their mine either to-day or to-morrow. The work will be prosecuted with vigor, with four shifts of six hours each in the shaft. The Hornet has one of the best prospects in the district, and the resumption of operations by the company will doubtless prove a big lift to the town. Everything at the works is in good shape for a continuous run, with four months' fuel stacked on the ground.

GLAND PRIZE.—Sinking the main shaft, making over three feet a day. No water to bother. Drifting in lower level, and stoping between third and fourth and above the 150-ft level. Taking out about 45 tons of sulphuret and 20 tons of chloride ore per day. New shaft down 75 feet. Sinking continues at the rate of three feet per day. Very little water. The mills running at their utmost capacity. On hand at the mine and mills, 700 cords of wood, 1,600 tons of coal and 1,500 cords of sagebrush.

TYBO DISTRICT.

Two G.—*Cor. Tybo Sun*, Jan. 12: The Two G is furnishing more ore at present than the furnaces can get away with. Large quantities of ore are accumulating on the dumps and the indications about the mine all point to an inexhaustible ore supply.

WARD DISTRICT.

BULLION.—*Ward Reflector*, Jan. 10: On the authority of a man who ought to know, we will state that it is possible to turn out double as much bullion in the next 30 days as was shipped from Ward during the month of December, provided a sufficient amount of smelting ore of the character lately encountered in the Paymaster could be obtained. All of which is respectfully submitted.

On December 31st the Martin White company shipped 10 bars of bullion valued at over \$20,000—we did not learn the exact figures—making the fourth shipment for the month. The total bullion product for December is about \$84,000.

The furnaces were shut down on the night of December 31st in order to make needed repairs. Smelter No. 1 started up again on January 1st and No. 2 on the 2d. The cupels have since started up and everything is again in full blast.

Arizona.

HACKBERRY MILL.—From private advices we learn that work on the Hackberry mill, in Mohave county, is progressing vigorously. A part of the machinery is already in place. The battery frames and building are all under way. The mill is expected to be in running order by March 1st, and will be one of the most complete and effective mills in the Territory. Work on the mine is also being prosecuted vigorously, and it is showing well at all points. Important developments have been made in the lower levels, which add greatly to the value and permanency of the mine.

PLOMOSO.—*Arizona Sentinel*, Jan. 12: The Plomoso mining district, in this county, is now being prospected for silver, and is proving far richer than has ever been supposed. In the old days it was pretty thoroughly overhauled for placer gold, but at that time few miners knew anything about silver or could recognize its croppings when they saw them. From its being so close to settlements, later prospectors seem to have taken it for granted that there was nothing of value there, or that otherwise the ground would have been occupied. Tom Sherman and Bud Donaldson have struck two good galena and silver mines there, and located them as the Home Stake and Away Up.

PECK MILL.—*Arizona Times*, Jan. 5: The new Peck mill, it is expected, will start up in full blast within a week. She blew her whistle a few days ago. The Peck M. Co., of Arizona, has liquidated its indebtedness to the Bank of Arizona, \$27,000, for which certain stocks were hypothecated, the voting of which, at the meetings of the Directors, has been a matter of some dispute. This will change the stock in question into other hands, and no doubt, change the organization. We presume it will end in the disbanding of the Arizona Peck Co., and placing the whole management in the hands of the California incorporation.

BONDED.—J. R. Darroche, who has been five months in Humbug district, has come to town and signed a number of bonds, including the Oneida, Chenango, Huron, Maggie, Georgie, Naid Queen, and Rescue, which Charles Pletz took with him to California, with a view to organize capital to develop them. Darroche gives a good account of Humbug.

DRY WASHERS.—Valentine, the inventor and manufacturer of the Valentine dry washing machines, for the saving of the most minute parti-

cles of gold from the earth, shipped, this morning, by Mr. Wm. Underhill's team, three of these machines to Wickenburg, where they are to be placed in working order, and used on the poorer class of Vulture tailings, many thousand tons of which are piled up and waiting the advent of these machines, which are to separate the precious metal from the barren dirt. The richer tailings, of which there are large quantities, are being treated by pan process, with the most satisfactory results, and it is confidently believed by those who are competent to judge that these tailings contain over \$2,000,000 in gold, all, or nearly all, of which will be rescued and put into the pockets of the enterprising proprietors of the pan and dry-washer process.

HUMBURG.—The dump piles of the Tiptop are growing larger and greater day and night, and with rich ore.

The Madden claim, owned by Miles, Finlay & Co., is being worked, and turning out some rich rock. They have several tons of ore on the dump that will average \$5,000.

On the Red Bird the depth of shaft is about 25 feet, and although the rock is not as high grade as some, yet the ledge is of that width which makes it encouraging.

The claim called "Black Jack" is situated close to the Tiptop, and owned by Bostwick, Doherty & Co., and is very rich.

The Silver Palace, owned by Carpenter, Groll & Co., is increasing in width as they sink, and they have a quantity of the ore sacked, which, according to assay, goes to \$200.

JOHNNY BAYARD and Fred Plum are at work on the Legal Tender and Orbis. The assay on the latter is \$879.63.

Idaho.

ALTURAS CO. MINES.—*Cor. Idaho Avalanche*, Jan. 12: The Monarch company are working but five or six bands all told. Supt. Gaetz, of the Chicago Tunnel Co., is pushing work with satisfactory results, having completed the first 200 feet. It is splendid working ground, but very wet. Every 24 hours six feet of progress is made. This enterprise will have a great tendency towards developing the mines in Atlanta hill. During our holidays all mining operations were suspended, to start up again after New Year's. The Vishnu lessees have commenced to stoep out, and the Superintendent, Frank H. Rollins, is developing the Confederate and Golden Star mines, and has also started up the pumps of the Ada Ellmore mine to-day. The pumping gear connected with the mine is running like clock-work. Taking all things into consideration, our mining outlook is favorable.

BLACK JACK.—Reports from the Black Jack mine continue to be very favorable, and according to all accounts, the deeper they go the better it looks.

A LETTER from Mars Basin, Owyhee, of a recent date, says that some important mineral discoveries have been made within three miles of that place.

A FRIEND writing from Atlanta says that the Buffalo mill is running steadily and crushing ore at the rate of 10 tons a day, which yields about \$1,000.

SOUTH MOUNTAIN.—From a recent interview with Mr. W. W. Hastings, of South Mountain, we learn that the prospects of that camp are gradually brightening. He is running a tunnel into the Golden Monarch, and expects in a short time to tap a five-foot ledge, in which there is abundance of rock that will yield \$150 to the ton. There is a large quantity of good ore lying on the dumps in and around South Mountain which, if crushed, would yield somewhere in the vicinity of \$40,000, and it seems a misfortune that the furnaces cannot be used to make the reduction. The great obstacle in the progress of South Mountain has been Wm. M. Lent, and it is pleasing to know that he will stand in its pathway but a short time longer. All the old company's mines have been relocated and, with the furnaces and other property will, in a very short time pass into new hands. Mr. Lent himself admitted that South Mountain was a better camp than Eureka, and if his management had resulted in an honest and legitimate development of the mines around South Mountain, that camp to-day would be one of the most prosperous on the Pacific coast. As it is, the few men who have remained there are bound to make fortunes.

Oregon.

APPOINTED SUPERINTENDENT.—*Oregon Sentinel*, Jan. 9: J. S. Howard has been appointed Superintendent of the mines of Klippel, Hanna & Co., and will take charge in a few days. Mr. H. is an experienced mining engineer, and we congratulate the company on having secured his services. Work at these mines is progressing as well as can be expected, the only interference at present being the cold weather.

WEBFOOT.—Prof. J. M. Tiernan arrived in this place on Saturday last and left for Josephine county on the following Monday. He has severed connection with the Lucky Queen mine, and is now Superintendent of the Webfoot, in Josephine county, and was on his way to take charge when passing through this place. A recent assay of ore taken from this place proved it to be a valuable one.

Utah.

FRISCO DISTRICT.—*Cor. Salt Lake Tribune*, Jan. 9: Everything in this burg is progressing finely. The new smelters of Campbell, Cullen & Co., under the management of Mr. John D. Williams, are running splendidly. The Godhe & Co. smelter is also doing well and running better than ever. The Frisco reduction of Har-

ries, Fischer & Co. will send their first bar of fine bullion to Salt Lake City in one week from to-day. The bar will weigh about 80 pounds of fine silver. Wells, Fargo & Co.'s express office is to be established here with John M. Burke as agent. This is a want long felt. The Great Horn silver mine is looking huge. It is beyond the comprehension of any miner or expert at present. Another large body of horn silver ore has been struck in sinking, and the average assay is 300 ounces silver, and the Lord only knows how big it is. The heavy lead ores still continue to improve and grow richer.

British Columbia.

GOLD YIELD.—A. W. Vowell, Gold Commissioner of the Cassiar district, reports that the number of miners has not at any time during the past year exceeded 1,200, including 300 or 400 Chinamen, and the yield has been \$500,000, including \$173,000 from Thibert's creek, \$145,000 from McDamo's creek, and \$81,000 from Deare creek. The season was not favorable on account of numerous freshets. He thinks that Thibert's creek may double its yield next year. The Cariboo district produces about \$500,000 annually.

News in Brief.

MINISTER NOYES conveys to the United States the thanks of France for proposed participation in the Paris exposition.

HENRY M. STANLEY, the African explorer, has been presented with a gold medal, the gift of the late King Victor Emmanuel.

The Crispin troubles have extended to Marlboro', Mass., where several strikes began on Monday.

The average daily mortality from cholera at Mecca, to the 31st of December, was 60; at Jeddah, 38.

ALFRED E. EDGUMBE has been appointed by Congressman Luttrell as cadet to West Point. The young man is a resident of Vallejo.

SLADE the Spiritualist, has been expelled from Vienna, because he was unable to describe his avocation satisfactorily to the police.

The storm and heavy sea of Tuesday night badly damaged or destroyed the wharves at Carpinteria, Morro Landing, Ventura and Santa Barbara.

The exports from New York last week included 853,505 bushels of wheat, 218,442 bushels of corn, 6,624 bushels of oats and 77,892 bushels of barley.

SERGEANT CHARLES MCCARTHY, one of the recently released Fenian prisoners, who, with his companions reached Dublin Saturday, died suddenly on Monday.

The sloop-yacht *Clara*, having been purchased in New York by San Francisco parties, will be brought hither on the deck of the clipper ship *Young America*.

The railroad company has discharged about 300 Chinamen, they having completed their part of the grading on the railroad now building between Benicia and Suisun.

THREE hundred miles of railroad were constructed in this State last year, bringing the number of miles in operation up to figures exceeding 1,000.

On Saturday last, at San Rafael, a boy nine years old, while watching the operation of scalding a hog at the slaughter house, fell into a vat of boiling water. He died on Monday.

THE Courts have decided that the money for the compromise in the Lick trust matter, must come from the portions of the residuary legatees, viz., the Pioneers and Academy of Sciences.

GEORGE H. PENDLETON has been elected United States Senator from Ohio to succeed Stanley Matthews, the latter having been chosen to fill the unexpired term of John Sherman, Secretary of the Treasury.

The two most important Committees at work under Glover's resolution are: Whitthorne's Committee on the Navy Department and Glover's on the Treasury. The latter have evidence already that promises sensational developments.

THE Cousett (England) Iron Co., the largest makers of ship plates in the world, have blown out one of their blast furnaces, and the men employed at another furnace have received notice that their services will not be required at the end of a fortnight.

POSTMASTER-GENERAL KEY says business has so increased in the South that over 200 post-offices have been made presidential offices, namely: such as receive appointment from the President, and confirmation by the Senate. This indicates prosperity.

It has been resolved at a meeting of the Board of Directors of the Bank of California, to declare a dividend at the rate of seven per cent. per annum for the three months ending December 31st, payable on the 15th instant. No dividend has been paid by the bank since July, 1875.

SENATOR JONES still maintains that the President will sign Bland's silver bill if passed, and ridicules the idea that it will receive a veto. He refuses to believe the President will go against the silver sentiment of the West and allow his judgement to be influenced by hard-money members of the Cabinet.

LEUTENANT CLARK, who left New Red Cloud agency on the 7th instant, and New Spotted Tail on the 11th, says: "The Indians at hot agencies are well satisfied with the promises so far carried out, but they are anxious to move back from the Missouri river in the spring, and trouble is anticipated if they are not allowed to do so."

THEY have had a \$250,000 fire in Honolulu. THEY are having serious freshets in Virginia. HENRY M. STANLEY, the African explorer, is now in Rome.

THE amount of customs dues paid at this port last week was \$73,299.

A BABY show is the latest place of amusement in this city.

CASES of garroting still continue on the outside streets, in this city.

THE Roger bill for employing 2,000 men on the streets of this city, has been defeated.

A SEAMEN'S betel has been established at Portland, Oregon, the first in the State.

A CHINAMAN, arrested for murder last week, committed suicide in the city prison on Monday night.

CAPT. BOGARDUS, the shot gun expert, has succeeded in breaking 5,000 glass balls in 500 minutes.

THE winter is now severer in Turkey than that during which the Germans campaigned in France in 1870-71.

THE heaviest northeast gale ever known on the coast of Maine prevailed last week. A great amount of damage was done.

A SENATORIAL election will be held in Alameda county on the 23d, inst., to select a successor to the late Nathan Porter.

CHEYENNE business men are making overtures to have that place fixed as the starting-point of the Black Hills railroad.

THE Postoffice Department has issued orders to increase the mail services between San Rafael and Petaluma to three times a week.

JAMES R. KEENE says there is no truth in the California stories of his intention to return to San Francisco, for residence or business.

THE bark *Osmyn* was sunk by a collision with the bark *Aurcola*, near Port Townsend last week. Both vessels belonged to the same owner.

A FIRE broke out in the steamship *Herman*, while at sea, on Friday evening, which was with great difficulty subdued, after several hours' effort.

THERE are now 854 manufacturing establishments in San Francisco, whose aggregate products amount to \$62,333,000. They employ over 26,000 persons.

REV. HENRY WARD BEECHER offers to give up a quarter of his salary, in view of the falling off in pew rents. This will make his salary \$15,000 for the year.

H. L. TAYLOR & Co. struck a new well on Simon Well's farm, on the Ghost Well territory, Pa., which is flowing over 1,000 barrels. It opens up a large tract of new territory.

THE Immigration Society of Guatemala, founded under the auspices of and protected by the government, have sent an agent to San Francisco to endeavor to direct immigration to Guatemala.

A LONDON dispatch says that the Wigan cotton spinners have resolved, in consequence of the depression in the trade, to give all their operatives notice of a five per cent. reduction in wages.

At Lynn, Mass., on the 14th inst., most of the shoe operatives were requested by the employers to withdraw from the Crispin organization or quit work. The Crispins have adopted the latter alternative.

GENERAL SHERIDAN has been informed by the War Department of the ravages of Bannock Indians, who threaten a severe outbreak in Montana that will devastate ranches and destroy the lives of white people.

THE boring of the Channel tunnel between France and England is to be done by the French Railway company, the Chemin de Fer du Nord, and the Southeastern and Chatham Railway companies of England.

DEMETRIUS BULGARIS, the well-known Greek politician, has just died of apoplexy. He was President of the Provisional government of Athens in 1862, and later was President of the Council and Minister of the Interior.

W. S. DUVAL and W. T. Duncan, (son of Duncan, the Pioneer Savings bank defaulter,) have been arrested on charges of felony, as accessories to the escape of J. C. Duncan, by harboring and protecting him and not giving him up to the officers.

THE revolution in the northern Provinces of San Domingo continues. The insurgents surrounded Porta Plata, Santiago and La Vega. The whole mercantile community is in danger of being ruined. It appears that Ex-President Gomez is leading the revolution.

A STEAMER arrived at New Haven Saturday for a cargo of arms and ammunition for the Turkish government. Another steamer, laden with war material valued at \$1,500,000, has been in the sound the past 14 days, waiting orders to sail for Constantinople, drawing, in the meantime, \$250 per day demurrage.

SENATOR MCCORMICK has introduced a bill authorizing the Board of Supervisors of San Francisco to expend \$50,000 out of the General Fund for the improvement of Golden Gate and Bellevue parks, under the direction of the Commissioners, a part of which is to be used for the Lick observatory; also, \$25,000 for grading and improving the squares and plazas of the city, under the direction of the Superintendent of Streets; \$10,000 for cleaning sewers, under the direction of the Board of Health, and \$25,000 for cleaning the streets. The bill further provides that the Board of Supervisors shall fix by resolution the compensation of the men to be employed at a rate not exceeding \$2 per day, and that no man shall be employed who was not a resident of the city at the beginning of the year.

The Preservation of our Fisheries.

A subject which possesses present interest, both for its intrinsic worth and from the fact that it is up for legislative consideration, is the preservation and restocking of our California fisheries. That it is as advisable that our bays and streams should be made to yield their proportion of our food supply, as that a like area of our soil should be brought to its fullness of fertility, is admitted by all who are aware of the importance of the subject. To be convinced of this fact one has only to study the position which fish occupies in the food supply of the world and the achievements which have been made in intelligent fish culture during the last few years. We have no space for this inquiry at this time, although the facts are very interesting. Suffice it to remark that France years ago demonstrated that an acre of water may be made to yield from \$10 to \$50 per year by the cultivation of fish. We have no data for determining the possible result of making all available California waters thus productive, but Massachusetts, with more than 500,000 acres of ponds and rivers, is pushing forward most rapidly toward restoring these waters to their old-time fullness of fish production, thereby expecting to aid her citizens with at least \$5,000,000 per year in the value of fish taken from what a few years ago were almost waste waters. This is at least worthy of the careful consideration of Californians, both to strengthen their favor of the operations which are now being prosecuted by the State through our Fish Commissioners, and to induce them to stock the ponds and streams which lie within their own fences.

We have been much interested in reading the straightforward and practical report lately made to the Governor by our Fish Commissioners, Messrs. Redding, Throckmorton and Farwell. They have evidently been diligent in the prosecution of their gratuitous labors and they deserve the thanks of all. Their report contains many points of general interest and information and other points of which bring forcible support to the maintenance of our legal provisions for the preservation of our fish during the spawning season. We shall instance chiefly the former at this time; leaving the latter until we know that the preservation measures are definitely assailed.

Of the reduction of the salmon supply which has been caused in this State the report says: "In 1850 the salmon resorted in vast numbers to the Feather, Yuba, American, Mokelumne and Tuolumne rivers for purposes of spawning, and many places, such as Salmon Falls, on the American, were named from the abundance of these fish. On the Yuba river, as late as 1853, the miners obtained a large supply of food from this source. At the present time no salmon enter these streams. It would be safe to estimate that one-half the streams in this State to which salmon formerly resorted for spawning, have, for this purpose, been destroyed by mining. As mining is the most important industry, of course, for this evil there is no remedy, other than by artificial means to increase the supply in those tributaries that are still the resort of these fish. * * *

"The introduction of more than 8,000,000 young salmon into the headwaters of the Sacramento, since the organization of the Commission, in addition to the natural increase, has had the effect to keep up the supply and reduce the local market price of these fish. It is reported that the 'cannery' at Collinsville has purchased all the salmon it could consume during the past season at from 25 to 40 cents each.

Of the actual increase in the catch of salmon in the Sacramento and San Joaquin rivers, the Commissioners make the following statement: "In our last report we showed the total weight as transported from the leading places of shipment to San Francisco from November 1st, 1874, to August 1st, 1875, to be 5,098,781 pounds. This year's tables show the catch from November 1st, 1875, to August 1st, 1876, to be 5,311,423 pounds, and from November 1st, 1876, to August 1st, 1877, 6,493,563 pounds. This shows a gain of more than 1,000,000 pounds in the legal catch over any year since the organization of the Commission, and may be ascribed to the fact that our waters are now beginning to feel the beneficial effects of the millions of salmon hatched artificially and turned into the headwaters."

The report aside from the points in favor of the close season for salmon, makes specific mention of the wrongs which are being practiced upon our fisheries. One point is as follows: "The Chinese and others continue to use nets of a mesh much finer than is allowed by law, and the young of all kind of salt water fish that spawn in the bays and estuaries, are persistently caught, dried and shipped to China. The records of the Custom House show that there were shipped to China, from San Francisco, during the year ending July 1st, 1877, dried fish and dried shell fish valued at \$293,971."

Although the labors of the Commission are mainly expended in the preservation and increase of our noble fish, the salmon, due enterprise is shown in introducing valuable fish from foreign waters. The reports mention the shad, which are now becoming quite numerous in the Sacramento river, and the catfish, which are

now becoming quite an addition to the fish supply of the State capital. They have also implanted in California waters, white fish from the East; carp from Japan and the Danube; "awa," the most valuable fish of the Sandwich Islands; and mullet from the same waters; trout, black bass, eels and lobsters from the Eastern States. All these have been put in appropriate waters in different parts of the State, and already there is evidence that they are thriving and multiplying. The results from all the enterprising movements of the Commission will ere long prove the wisdom of the State in taking steps for making its waters more and more productive of valuable food for the people.

California Climate and Consumption.

Indiscriminate praise is productive of evil. It cannot be doubted that our favorite State has suffered more from flatterers than defamers. Glowing statements with either thoughtless or studied neglect of qualifying conditions are quite apt to mislead, and those who place reliance upon them often reap disappointment. Those who have glorified our conditions as favorable to industrial success have many times forgotten to state that labor is requisite to success here as elsewhere. The result has been that hundreds of thoughtless persons have come to California expecting to gain a livelihood and a competence simply for the asking. Failing, of course, to receive it upon such conditions, they have become bitter denunciators, blaming the State for the failures which their own weak hearts and unwilling hands achieved. Not otherwise has been the praise of the climate of California in its relations to consumption. Glorious as we find our clear and invigorating air and warm sunshine, we have been too apt to speak of it as the sovereign cure for all the ills to which flesh is heir. Especially in its favoring influence upon those afflicted with consumption has our climate been lauded high. This general praise has been productive of evil in many cases because it has been spoken without discrimination. We have forgotten that we have a complex climate, and therefore discrimination is most necessary. We have also forgotten that consumption is a disease capable of division into degrees, and in its later stages seems to pass almost wholly beyond the reach of climatic influences. For these reasons there seems occasion to conclude that in some cases California climate, in its relation to consumption, has been praised not wisely but too well. We are glad to see that this subject is being considered by competent and discriminating minds, and that the true opportunity which our State affords to unfortunate victims of lung diseases, bids fair to receive true exposition.

One of the most interesting papers in the valuable report which our State Board of Health has just handed to the Governor, is upon the subject which we have mentioned, and is by Dr. F. W. Hatch, of Sacramento, the permanent Secretary. For the information of our readers, both here and at the East, we propose to present, as briefly as possible, the leading points brought forward by Dr. Hatch. For practical purposes he divides the State into four regions, more or less distinct, in respect of climate. First, the coast and the valleys bordering thereon; second, the interior valleys, as the Sacramento and San Joaquin; third, the Coast range mountains; fourth, the Sierra Nevada mountains. These divisions are also subdivided in the report.

Beginning with the climate of the coast and the coast valleys, Dr. Hatch starts at San Francisco with a mean annual temperature of 55.23° Fah., and follows the coast to San Diego with a mean temperature of 62.11° Fah., including a narrow belt of country extending along the coast for a distance of 479 miles. The climate of this extensive district presents certain features in common though varying in degree—a winter season mild and agreeable, a certain amount of fog, and cool wet winds in the summer. Taking San Francisco as an extreme, we find some modifications in each of these extremes as we go southward. The number of foggy days may be said, as a rule, to become less, the severity of the summer winds is subdued, the temperature somewhat higher and more equable, the rainy season shorter and the rainfall less abundant, and intervening between these two seasons of summer and winter, a short season representing spring, which becomes more and more attractive, inviting by the mildness of its temperature, the purity of its atmosphere, the early freshness and beauty of the vegetation, and combining all these qualities which have given to this region its popular reputation as a resort for health. Dr. Hatch then proceeds to analyze the different localities along the southern coast, and adduces the testimony of local physicians as to their fitness and unfitness for consumptive people, and the months in the year when these qualities are most predominant. We have no space to follow these interesting inquiries, but the result will appear in the general conclusions which we shall present before we close.

Of the climate of the great central valleys, the Sacramento and San Joaquin, an extensive district, stretching from the 35th to the 41st parallel, with an average width of 50 or 60 miles, it is said: The meteorology of this vast

region presents certain features common to every part. As compared with the coast region, the atmosphere may be said, in a general way, to be warmer and drier during the summer, not much subject to fogs, a high temperature during the day, with a considerable reduction at night. Although giving this region of our State full credit for its many charms and excellencies, Dr. Hatch concludes that "in the prolonged high temperature, the sudden changes which occur in places subject to the influence of the ocean winds (which sweep through the Straits of Carquinez and diverge north and south), the comparatively greater humidity of the atmosphere, and the presence of malaria, is found a combination of circumstances which would seem to render this interior valley region ineligible as a summer residence for the consumptive."

Concerning our mountain climate, both of the Coast range and the Sierra Nevada, Dr. Hatch speaks at length and with definiteness. We have space only for his general comparisons. As compared with the great valleys, the mountain climates, as a whole, possess a less prolonged season of high temperature, a lower relative humidity; comparative exemption from malarial influences; altitude and its supposed advantages in chronic pulmonary disorders. As compared with the coast region, the mountain climates have a lower relative humidity; a greater exemption from winds and fogs; the advantages of altitude and a more invigorating atmosphere. These points of comparison refer to climates in the different regions during the summer months.

After treating his subject in all its parts scientifically, so far as data afford ground for a scientific deduction, Dr. Hatch concludes with the following general observations:

First—That for the majority of invalids seeking a change of climate in consumption, the mountains—preferably the Coast range—offer advantages, during the summer and early fall months, superior to those of any other portion of the State.

Second—That a certain proportion may find the eastern slope of the Coast range agreeable and beneficial even during the winter season.

Third—That a life in the open air—camp life, with the exercise to which it invites, agreeable companionship, pleasant occupation of mind and body, are indispensable to the attainment of the full benefits to be derived from climate.

Fourth—That for a large proportion of consumptives, some point on the southern coast seems eminently suitable as a winter residence.

Fifth—That the premonitory stage of phthisis, or the first stage of its actual development, are the only ones in which climate may be safely relied upon. That some cases in the second stage may be greatly benefited, especially when the nutritive processes are not seriously impaired. That a few may secure an apparently permanent arrest of disease, and enjoy good health for many years; but that the climate of California, while it may for a time seem to inspire hope offers, in reality, no very strong inducement to these lapsing, or who have already passed, into the third stage of disease.

Sixth—That the remedy, if found beneficial, must be continued from year to year, until the restoration of the nutritive processes is complete, and the progress of disease, as determined by the physical signs, appears to be arrested.

Work for the Unemployed.

The problem which is now forced upon public attention by the threats and demands of incendiary leaders is one which should be quickly brought to solution. Although we have no sympathy nor tolerance for the riotous incitements of those who have constituted themselves leaders of the unemployed, it cannot be doubted that in the rank and file of those who follow this unfortunate leadership there is real hardship and an honest desire for assistance. In our view of the matter, the way to meet this condition is to disarm the movement of the only element of strength there is in it, and that is by providing work for the unemployed at a price which will sustain life. If there were no material in the form of men without employment, the fabric of riot, which a few men are striving to weave for their own aggrandizement, would fall to the ground by its own weight, and the weavers would be regarded as too harmless and worthless even to lumber up a prison.

In the first place, the State and municipal governments, in their beneficent character as conservators of the public well being, could, we think, find fitting opportunity for the exercise of their paternal functions in providing a means of earning bread to those who are kept from it by the exigencies of the times, and not by their own fault or choice. There are public works which can be wisely undertaken, and which can never be more cheaply executed than now. There is wealth enough in the country to defray the expense with no hardship, for the chief burden will come on those who have most, and whose money now lies idle in the banks because of the slight demand for it. There is prospect enough in the future of the city and State to warrant the inception of wise and permanent improvements now for the coming generation to pay for, and capital is said to be ready to entrust itself for future returns.

Second, it seems evident to us that the cheapest way by which the public can release itself from dangers which now threaten destruction

of life and property, is in disarming the malcontents by providing for them, rather than by allowing them to pursue the present evil tendencies until they eventuate in riot and crime. Prevention is proverbially better than cure. It would be far cheaper to build a boulevard than to fill our streets with armed militia. The desert wastes of Golden Gate park can be made to blossom like a rose for less money than the city would lose by a riot and by the prosecution and execution of the offenders. No one doubts but than uprising like that we bear so freely threatened would be quickly and permanently crushed if it should assert itself; but who thinks it is the dictate either of economy or humanity that the city should wait to have its streets raked by grapeshot and perhaps its proudest buildings in ashes? We have, of course, no belief in the accomplishment of the revolutions which agitators urge upon their ignorant and thoughtless followers, but there is reason to fear that they may inflame desperate men to deeds which may lead to the destruction of a part of the city and their own. This is what we believe can be prevented for far less money than it could be cured, if the disease is permitted to break out. For this reason we are in favor of the request which the city is making this week upon the Legislature for permission to raise money on its own security for the prosecution of certain beneficial public works. If the city can thus offer a livelihood during the winter to those who will labor for it, the present movement of the unemployed will be shorn of all the strength there is in it, and those who are now endeavoring to profit by men's misfortunes will be forced to seek more honorable employment.

It is claimed by those who object to the city's offering employment to all who need bread, that the announcement of the city's action would bring thousands of unemployed from the country, and the city would thus be forced to bear the burden of the whole State. This would probably be true to a certain degree, and it might be advisable for the State to undertake some needed public work in the interior. It might be found that the West Side canal project was ripe enough to push forward into actual building, and this would give employment to an army of men. This too could now be constructed cheaply if the funds were honestly administered, because men could be had at little more than the cost of living. It would be, of course, unwise to begin a work of this kind hurriedly, but we take it that the canal has been virtually decided upon in some form and the Legislature might safely order that the preliminaries be accelerated with all proper speed and the work begun. This project would have to be fostered by the State, although the benefited lands should ultimately fully assume the burden. Thus it might be found that the State could most cheaply provide for its unfortunate wards and relieve communities from the sustenance and plundering of the horde of tramps which now besiege our farm and village homes. The whole State would be interested in this result. As it is the burden of supporting tramps falls most upon those who can least afford it. If the State had work for them and should direct them to assume it or go to prison, many a resident of the interior would breathe more freely and sleep more soundly.

The beginning of the West Side canal this season, should it be found practical, might give work to those who may need it none the less, although they are good citizens and not tramps, nor "revolutionists." Should this year prove dry as the last, a contingency which seems quite possible, at least so far as the San Joaquin valley is concerned, there would be a need among many dwellers in that district of opportunity to employ their hands and teams. It has been shown by experience in the valley that the farmers build the best irrigation ditches, and it would be a boon to many to find employment on a public work which their own fields denied. For this reason, as well as for giving livelihood to the country's "unemployed," it would be a public benefit to have this work begun and prosecuted with vigor.

The view which residents along the line of the canal and elsewhere take concerning its building is to be learned even more fully during the coming week, as the Senate committee on irrigation has resolved to hold meetings at different parts of the State, as may be seen by an article in another column. We trust that something may be found feasible, both in city and country, by which work can be afforded to all who honestly need and desire it, and then "agitators" and "revolutionists" will find themselves without an avocation.

THE Victoria Colonist of a late date has the following: On two streams that empty into the Alhemi canal, about six miles from the mill site, some 35 Chinamen are engaged in gold-mining, and it is said that they average nearly \$1.50 per day, a rate of pay sufficient to satisfy John's yearnings for sudden wealth. The gold is found in the beds and banks of the streams.

THE Conley & Gowell Consolidated mining company has recovered judgment in the Fifteenth District Court against the Excelsior Gravel mining company for foreclosure of two mortgages and \$6,648.

THE Mexican Congress has voted to admit breadstuffs from other countries free of duty, which will be very advantageous for California, New Mexico and Texas, furnishing an available and profitable market for their produce.

A NUGGET weighing 26 ounces was taken from a placer claim at Oescenia on January 7th.

Continued from page 34.

which runs from the main shaft south 225 feet, on the west side of the ore body, and thence east to the Gould & Curry drift. This drift has secured for us good ventilation, and the south ore-breasts can again be reached.

The 1650-Foot Level

The drift which starts from the Consolidated and California joint shaft on this level has been carried forward to the ore vein. The sill-floor of the ore vein on this level has been opened the full width of the vein for the distance of 200 feet from the northern boundary of the mine to the south. The upper, or 13th floor of this level is worked only 100 feet south of the north boundary line—as by our system of working, each floor below is kept in advance of the floors above. A large quantity of valuable ore remains in place on this level. The ore in the face, going south, continues of good quality, and maintains its original width.

1750-Foot Level.

This level has been opened by running a large drift from the Con. Virginia and California joint shaft to the ore vein, 650 feet. The ore body on this level has been developed by running a drift the whole length of the mine connecting with the Best & Belcher drifts and with the Gould & Curry shaft on the south; also by three winzes connected with the 1650-foot level. A joint drift has also been run across the ore body near our northern line from the east clay wall to the west clay wall. Crosscuts numbered two and three, nearly 100 feet apart, have been run across the vein from wall to wall. The vein retains its width and in this respect it is equal to, if not greater than that on the level above, and it is more regular and has better defined clay boundaries and walls. There is some good ore on this level, but the greatest portion of the ore, so far as it has been exposed at the present stage of the opening of the level, is of a low grade. The good ore is confined to the east wall, and so far as it has been developed is 28 feet wide in the widest place.

Subsidiary Work.

The foregoing is a summary of the chief points of interest pertaining to the operations on the several ore yielding levels of the mine. In addition to the operations detailed above, a vast amount of subsidiary work has been done during the year, such as keeping in condition the shaft and etations, maintaining lateral drifts, opening and keeping open air connections, etc. This necessary dead work entails an expenso of at least \$20,000 monthly, and a large portion of this expense accrues from the necessity of keeping up ventilation in a temperature which ranges from 85° to 110°. In working these wide bodies of ore the pressure of the ground around the worked stopes is so great that it requires a large force of men to keep the mine in a working condition. Furthermore, to work these wide bodies successfully, the ore must be extracted rapidly to avoid caving of the ground and the crushing of timbers, by which a large amount of ore would be lost. This rapid extraction of ore calls for a corresponding increase of work, which swells the mining expense for the time being, but is economy in the end.

The main shaft has been sunk from the 1550-foot level, and connected with the drifts in the ore vein on the latter level. Four hundred feet of it has been retimbered and some parts of it three or four times. It is passable, but not in good order. In the coming year hoisting must be discontinued for two or three months as the shaft is badly crushed and dangerous, and requires extensive retimbering. The various lateral drifts on the several levels, also need retimbering. It is very difficult and expensive to make these repairs while ore is being extracted, and I therefore recommend that at some time in the ensuing year, the work of hoisting ore through the old main shaft be suspended for a sufficient time to make these repairs.

The Monthly Dividends.

There is a great deal of ore yet in the mine for dividends. How much, it is impossible to estimate with any accuracy. But until we make further explorations below the 1750-foot level, and complete the necessary repairs spoken of, I would further recommend a reduction of the monthly dividend.

The Con. Virginia and California joint shaft has been sunk from 25 feet below the 1650-foot level to a point which is 12 feet below the 1850-foot level; and the timbers for a shaft station at the latter level are already in place. The heavy flow of water has continued throughout the year, and remains unabated. This heavy flow of water, amounting from 43 to 45 miner's inches, all comes into the shaft at a point 37 feet above the bottom of it, with the exception of about 10 inches that issues from the C. & C. drift on the 1500-foot level. The bottom of the shaft is now dry and in very hard blasting rock.

Each hoisting compartment of this shaft is fitted with three cages, one over the other, which enables us to hoist three tons each trip in each compartment. A fourth cage is in readiness to be added to each compartment whenever required. Two of the cages are loaded at the same time, and they are also unloaded simultaneously.

All the appurtenances to this shaft, such as the main building, the ore house, the hoisting and pumping machinery, the pumps, pump bohs, water tanks, etc., have not deteriorated in condition since my last annual report, but have rather been made more complete by such additions and changes as circumstances re-

quired, one of which is a large new air compressor, which has been constructed on a scale and in a manner commensurate with the large future requirements of the two mines. A branch track from the Virginia and Truckee railroad passes on two sides of the works, in close proximity to them, and this enables us, in the most convenient and expeditious manner, to land wood, timber and other mine supplies, and to ship to mill the ore which is raised through this shaft.

Our assay department, which has been in operation for nearly two years, has fulfilled our highest expectations as to its capacity for work and economy in expense. In it has been melted and assayed, during the past year, all the hullion which has been produced from this mine and the California mine; and in the same time 40,484 assays of ore samples have been made for both mines.

In connection with this report you will find supplementary statements carefully prepared by Mr. Taylor, Chief Clerk, showing interesting facts in relation to the production of the mine. These statements are submitted for critical examination as a full and accurate exhibit of all that pertains to the expense of working the mine, such as the amount of labor employed, its divisions and cost; the nature and cost of all materials used; the cost of reduction of the ore, and the character and amounts of various other expenditures which are always incident to our mining operations. Yours, respectfully,

JAMES G. FAIR, Supt.

USEFUL INFORMATION.

Smoked Goose and Duck.

We do not know how practical the following suggestion may be, but there is interest in it certainly. Mr. W. M. Ryer writes to the *Bulletin* as follows: On the continent of Europe smoked geese and other wild birds are to be found in the provision stores, and are sold at prices considerably higher than ordinary meats, being considered delicacies. The breast or liver of a goose, when smoked, is a choice morsel for an epicure, and the whole bird is at all times desirable as a change in the ordinary routine of the dinner table. You are aware that in the mountains of California and Nevada among the miners, and upon the plains among the farmers, fresh meat cannot always be had, except in or near the towns. From this both miners and farmers become consumers of salt and smoked meats, as well as canned meats and fruits. To these, smoked birds might advantageously be added. Smoked fish, such as herring, mackerel, salmon, etc., and smoked pork, in the form of bacon, ham, etc., and smoked beef and venison are all excellent articles for food, and why not smoked geese and ducks?

Some may suppose that at the price wild birds sell for in San Francisco, it would not be possible to get them in quantities sufficient for smoking. This is a mistake, for the birds are more abundant than the salmon in the rivers, and there are plenty of men to hunt them, provided they could dispose of them near their hunting grounds. Hunting grounds for ducks and geese are rarely near town, railroad depots or steamboat landings. The hunter of one day spends the second in getting his game on the cars; the third day finds his game in the hands of a commission merchant or middleman; the fourth day one-half or more is spoiled or is not sold, and the return made to the hunter is discouraging. Before the canneries were established only enough salmon were caught to supply immediate wants. Now fishing is largely for export trade. Smoking establishments are not necessarily expensive, nor do they require much capital to conduct them. Every slough, river, lake, and all the overflowed land abound in edible birds. If a hunter could send every day to such smoke-houses or curing establishments the game he shoots, he would have a profitable occupation, and probably 2,000 men who are now idle could thus find a means of living. As it is now, a hunter may drop fifty geese or ducks in a day, and find no available market for them, but if canning establishments were near his hunting place he could make satisfactory wages.

PERU AND THE CHINAMEN.—While Californians are trying to get rid of John Chinaman, the Peruvians are making unusual efforts to induce him to come and work on their sugar plantations. The government of Peru has granted a subsidy of \$120,000 to a company which proposes to establish a line of steamers between Callao and Hong Kong, and an agent has arrived in San Francisco to engage Chinamen to embark for Peru, where there are promised the "freedom of the country" and a "soft" dollar (about 80 cents) a day for work on the sugar plantations.

THE WORLD'S WINE PRODUCTION.—An official statement gives the number of gallons of wine produced by each of the grape-producing countries of the world for 1876: France, 1,176,076,119; Germany, 76,317,204; Switzerland, 30,000,000; Bohemia, 85,000; Austria, 84,802,841; Hungary, 221,214,400; Russia (provinces in part), 44,361,000; Portugal, 111,000,000; Turkey and Roumania, 22,000,000; Australia, 1,928,624; Cape of Good Hope, 1,785,926; Balearic and Canary Isles, 291,456; Spain (in part), 66,000,000; Greece, 26,400,000; United States 14,000,000.

A Really Indelible Ink.

The ordinary so-called "indelible" inks are prepared from salts of silver, and the writing done with them can be removed by soaking the linen with a solution of cyanide of potassium (exceedingly poisonous, it should be remembered), or of hyposulphite of soda, or by moistening with a solution of bichloride of copper, and then washing with aqua ammonia. A really indelible ink, that is one that cannot be removed by chemical agents, says the *Journal of Chemistry*, may be made from aniline dyes according to the following recipe:

Dissolve 8½ grs. of bichloride of copper in 30 grs. of distilled water, then add 10 grs. of common salt and 2½ grs. of aqua ammonia. A separate solution is made of 30 grs. of hydrochlorate of aniline in 20 grs. of distilled water, which is then added to 20 grs. of a solution of gum-arabic, containing 2 parts of water, 1 part of gum-arabic, and, lastly 10 grs. of glycerine. Four parts of the aniline solution thus prepared are mixed with part of the copper solution.

The fluid thus prepared has a greenish color, but becomes black in a few days after being used for marking, or at once by the application of a hot iron, or on being otherwise heated. A steel pen may be used for writing with it. If the cloth, after being marked, is put into tepid soap-suds, the writing acquires a fine bluish tint.

The ink should be perfectly limpid, so as to penetrate the fabric, and the solutions should be mixed only when they are to be used.

ACTION OF PARAFFINE OILS ON METALS.—Dr. Stevenson Macadam read lately an important paper on paraffine oils and their action on metals before the North British Branch of the Pharmaceutical Society. In the course of a lengthened series of experimental observations on various paraffine oils, attention was directed to a certain oil which burned somewhat imperfectly in different lamps. It was feared that this oil was contaminated largely with lead compounds, which choked up the wick and ultimately diminished its capillary attraction so much that the light was extinguished. In a single night the wick of the lamp had to be changed several times, and the wick, when charred, left a fine network of lead. The oil had been stored in a tank lined with lead, and dissolved so much of the lead that its value as a luminant was destroyed. The action of the oil on tin, copper and iron was so slight that its luminant properties were not much diminished. Zinc, however, was much affected, as the oil was consequently rendered nearly as useless for illuminating purposes by it as by lead. Dr. Macadam, therefore, suggests that, while the vessels for the retention of paraffine oil may be safely constructed of or lined with tin, copper or iron, it would be preferable to use cisterns lined with enamel for storing the oil.

GOOD HEALTH.

Causes of Diphtheria.

In a paper read before the Syracuse Medical Society, and printed in the *Journal of Chemistry*, E. R. Maxson M. D., L. L. D., instances the following conditions as conducive to diphtheria: In this as in all putrid fevers every imprudence and deviation from the laws of health, such as exposure, want, improper clothing, unwholesome and improper food, low, damp apartments, filth of every kind, including animal and vegetable, act as predisposing causes.

A damp atmosphere, such as always exists in some localities, from protracted rains, or from warm weather at seasons when it is usually cool, there being little ozone generated to purify the air, may also predispose to this disease. It acts, doubtless, not only by causing to be retained in the blood the perspirable matter, but also by letting down the positive electrical condition, depressing vitality, thus rendering the brain incompetent to generate and distribute sufficient vital force to keep up a perfectly healthy condition of the system. The generation of ozone during thunder storms in summer, purifying the air, lessens the liability to this disease.

On the temperate, well-fed, properly clothed, and cleanly, whose blood may be up to the standard of health, such atmospheric and electrical influences may scarcely operate unfavorably. Not so, however, with the unfortunate children of want, who are half fed, improperly clothed, and filthy withal. Nor with the imtemperate nor imprudent, not with the gaudily-dressed, bare-armed and bare-legged children of wealth and vanity, equally unfortunate, their parents not having the discretion to protect a child as they would a brute.

It is probable, however, that in every case of diphtheria there is an animal poison introduced into the blood, either from the bodies of those suffering from the disease, or else arising from an accumulation, and perhaps decomposition, of various animal secretions and exhalations. It is also probable that the paludal poison is generally combined with the animal, in a greater or less degree; often in sufficient quantity to render the disease slightly remittent, and increasing its malignancy.

It appears that the animal and paludal poisons combined, or else the contagion, when it is thus contracted, may early enter the blood through the skin, stomach, or lungs, decomposing the fluid; and hence the putrid odor, and the fibrino-albuminous exudation, prostration, chills,

fever, and every essential feature of the disease; the animal miasm decomposing, or producing fermentation, while the paludal depresses the nervous system, causing the remittent tendency. The contagion, when it is the cause, produces a similar change in both respects; such cases being, perhaps, less remittent, especially in districts that are but slightly if at all malarious.

Among the sources of the poisons causing diphtheria, the most frequent are doubtless personal filth, dirty, damp apartments, imperfect sink-drains, privies, filthy water, pig-sties, hen-coops, and piles of decomposing animal and vegetable matters.

Adulteration of Tobacco.

Tobacco, as even its users know, says the *Boston Commercial Bulletin*, is notoriously adulterated, and so skillful are those who perpetrate these frauds, that it is almost impossible to detect the imitations of the choice brands. With the cheaper grades, where less care is taken, it of course is different. Of the vegetable substances used there are leaves of the dock plant, rhubarb, coltsfoot, cabbage endive, chicory, elm, oak, etc. In addition there are immense quantities of decayed moss and sea-weed used, with oakum, brown paper, logwood, and various other articles, most of them innocent of harm. The saccharine substances, such as beet-root, licorice, molasses, dregs, etc., are also nameless. But when we consider the article employed to give taste and pungency to the fraudulent combinations, it is at once seen what risks confirmed tobacco users run. To flavor these hogs manufactures, oxide of iron, chromate of potash, chromate of lead, umber and Spanish brown are used. Of all the preparations of tobacco, snuff is that whose use is attended with the most danger. It would be difficult to find a specimen of snuff which does not contain the oxide above mentioned, together with ealt, cayenne pepper, and very often finely powdered silica and glass.

ADAPT YOUR SHOES TO YOUR FEET.—Why it should be desirable to have a small, weak foot any more than a small and weak brain is not easy to conceive. For the purpose of having such small feet, not a few wear hoots one or two sizes too small, and about two-thirds of the width of the foot, as it would be at the ball if allowed to spread as it does when standing without the confinement of the hoot. As a natural and necessary result of such pinching confinement, the foot becomes deformed and larger than it would naturally grow, with enlarged joints, the toes turned from a line parallel with the foot, to say nothing of the troublesome corns so annoying and crippling to a large class of young women. The worst results of this crippling custom of wearing small and narrow boots is felt by children when allowed to outgrow their boots. It is poor economy to allow the young to wear hoots when the feet have become too large for them, since deformity of the feet is easily produced at this time. When the boot is too short for the wearer, and the heel too high, the ingrowing of the nails is a perfectly natural result.

SCARLET FEVER.—Rules for the prevention of scarlet fever have lately been issued by the Michigan Board of Health, and as this is one of the most contagious of diseases, it might be well to bear them in mind. The first precaution is the isolation of the sick from the well and the prevention of contact with the patient. The room should be cleared from all unnecessary clothing, carpets or other substances in which the poison may lurk and be thence transferred elsewhere. The patient should use rags instead of handkerchiefs, so that they may be burned. Body and bed linen should be placed in vessels of water containing chloride of lime or similar substance. Discharges should be received in a solution of sulphate of iron or copper and be afterward buried. Persons recovering from this disease should be considered dangerous as long as there is any scaling of the skin, soreness of the eyes, etc. Many other precautions are inculcated, all of which are considered more or less important.

ANOTHER CASE OF ANILINE POISONING.—The fact has recently come to light in Germany that poisoned aniline dye is sometimes used to color the lining of hats. A hat with a brown leather lining was purchased at Stettin, near the Baltic sea, by a gentleman, who began to suffer from inflammation of the head and eyes soon after he commenced wearing it. A chemical examination of the hat showed that the brown hue was imparted to the leather lining by means of a poisonous substance intermixed with the aniline dye made from coal tar, and the illness of the wearer was occasioned by the contact of the poison with his head.

THE CORSET LIVER.—Some medical students in one of the Cincinnati colleges, dissecting a female subject a few days ago, found what is called in doctor's parlance a "corset liver." When tight lacing has been practiced through several years, a permanent dent or hollow is produced in the liver, which may be seen very plainly after the woman is dead and her liver taken out. This kind of liver occurs so frequently in woman that physicians have given it the name of "corset liver." In the subject mentioned, the hollow in the liver was large enough for the wrist of a grown man to be laid in it.

The Week.

The week has been characterized, happily, by the heaviest storm and rainfall of the year, or, in fact, the past two years. The rain has been falling steadily and copiously for several days, and from all quarters of the State come encouraging reports from agricultural and mining districts. The farmers are joyful, since all fears of a dry season are gone and they see visions of a bountiful crop. The miners, who have been impatiently waiting for the water season to begin, will soon be turning the heavy stream against the gold-producing banks of gravel and repay themselves for so long a period of enforced idleness. The business men of the cities and towns see in the bounteous rains, prospects for a revival of business once more; and the working community see in it renewed chances for employment, so much needed. The miners throughout the State were beginning to despond at the long continued dry weather. The season of last year was short, as shown by the falling off in bullion product of this State. Having closed down their claims much earlier than usual, they hetrook themselves to preparing for this season's work, and nearly all the hydraulic mines of the State are in better condition in this respect than for many years past. The low stage of water in the ditches and flumes has given a good opportunity to have repairs made, so that now the water has come the miners are all ready for it. Under the circumstances, if a heavy snowfall in the Sierras stores up a good summer's supply of water, we ought to have the best gravel mining season for many years. The open winters have been very acceptable to the quartz miners, who have worked to much greater advantage than in wet winters; but they can afford to slow up for a while, in those regions where it is necessary, for the sake of seeing all hands at work again.

A MINER named Gray, an employee of the Eberhardt and Aurora Tunnel Co., White Pine, had his right hand blown off Tuesday, by the premature explosion of a blast.

Mining in 1877.

A Review of the Record of the Pacific Coast for the Year

We present herewith our usual annual review of mining interests and operations during the preceding year throughout the countries lying west of and adjacent to the Rocky mountains; premising that our remarks upon individual properties and localities must necessarily be brief where extended over a region so vast. The territory on which this business is now being actively prosecuted covers more than a third of the Union; and it is the case, too, that this industry as it expands becomes every year more and more diversified. From searching after and gathering gold alone, and by the simplest methods, it has come to include in its objects a great variety of minerals and metal, requiring for its successful prosecution the employment of large capital, costly and complicated machinery, skill and science. While this industry has been marked during the year by no feature or event calling for particular notice, it has still made gratifying advances as regards both its moral and material status; this remark applying with special force to mining for the precious metal. While there has been, as heretofore, too much attention paid to speculative operations and the manipulation of stocks, we have fewer failures in the

More Practical Departments of the Business

To note than ever before. Investments are being made with more caution and better judgment, deeper exploration and ore development being conditions precedent to the erection of works or other heavy expenditures. Then, too, this pursuit is being brought every year more and more into harmony with the normal conditions of labor. During a year distinguished the world over for strikes and a general discontent, the operative miners on this coast have abstained from acts of violence designed to intimidate employers or advance the current rates of wages, there having been, in fact, but little grumbling amongst this class, either on account of want of employment or the wages paid. The old stock of miners with us, being unaccustomed to work for wages, did not, for a time, give entire satisfaction as day laborers. The self-employed is apt to be adventurous, energetic and restless, tendencies that sometimes so grow upon him that they cannot be easily restrained when it becomes necessary for him to enter the service of others. Through the changes wrought by time and the introduction of workmen from abroad there exists here now as little trouble between the employer and the employed as in almost any other country. Our mining population is fast losing its nomadic character and adjusting itself to its new surroundings, and as the temptation to roam is constantly diminishing it will not be long before the terms "rush," stamped and like other expressions will become obsolete in our mining vocabulary. With the abatement of these exciting scenes and their cause there has still been kept alive, however, enough of the spirit of enterprise and adventure to insure the carrying on of

Constant and Energetic Exploration.

A number of mineral ore mines having been made the past year, and some new ore-bearing districts opened up. The most important of these discoveries have occurred in Arizona, that Territory opening to the prospector a broad, virgin field. Nevada, Utah, Dakota, and others of the inland States or Territories, still present inviting grounds for exploration, the discovery of seemingly valuable ore fields and a great extent of metalliferous lands being reported off that way. That the newly-found gold-bearing deposits of Dakota, though of eccentric formation and but little explored, will eventually show considerable capacity for bullion production, seems probable enough. Through the discovery of very promising gold-bearing lodes in the Cariboo region, British Columbia, an additional industry and a new form of mineral wealth seem likely to be given to that region. Some of the lodes lately found, near old placer mines of acknowledged richness, ought to prove valuable, or the theories in this connection are fallacious. It may be stated, also, that well authenticated accounts reach us of important gold discoveries in the more distant colony of New Zealand, with rumors of new quartz reefs and limited placers being found in some parts of Australia.

Through the successful explorations carried on at home, the area of our new-found metalliferous territory has been much enlarged, southern Utah, central Arizona and Dakota having been the theaters of the most notable expansion. In this connection it should be observed that our means and efforts are not wholly devoted, as in older countries, to the exploitation of deposits already found. A large share of our active exertions is directed to searching after additional fields and new forms of mineral health; and it is but just, when canvassing our achievements for the year, that some allowance be made for the energies expended in the furtherance of these objects. Our means are not all absorbed in utilizing resources already in hand, but we keep a large force of prospectors skirmishing in and sometimes far beyond our active mining frontier. While so much success has attended explorations carried on in remote districts, some of these efforts have resulted in

Disappointment and Failure.

Early in the summer, several well appointed

expeditions, fitted out in Wyoming, Dakota and Montana, visited and pretty thoroughly examined the Wind river, Big Horn and Yellowstone countries, without finding either paying placers or promising vein mines. The best surface diggings met with are reported as yielding not over \$1 or \$2 per day, being small and widely scattered at that. This was a region of traditional wealth, many extravagant stories having been told by the Indians, trappers and traders concerning the gold fields. Even Father De Smet, who had spent many years as a missionary among the northwest tribes, is said to have encouraged the idea of there being rich placers in the Big Horn country, asserting that he had himself had ocular proof of the fact. The examinations made the past summer would seem to negative all these stories, though the country without doubt possesses considerable resources in the way of agricultural lands, grass, water, timber, etc., abounding also with fish and game. From the gold-producing lands of Isabre, Guatamala, towards which some of our adventurous Californians had begun to look with longing eyes, an adverse report from an authentic source also comes to hand. Martin Durfee, a veteran prospector on this coast and an intelligent and trustworthy man, after a visit, made last summer, to the South African gold fields, tells us that they are tolerably rich but of limited extent, being confined to a narrow strip of territory, and so completely occupied, that there is no chance for a new comer to secure a claim, except by purchase, everything reduced to possession being held at a price above what it is worth. The country offers no inducement to the American prospector, capitalist or miner, both the gold and the diamond fields being all occupied and overrun with people out of means and in search of employment. In Chile, some American capitalists have just taken hold of the Catapilco gravel mines, but sufficient time has not elapsed to prove that the ground is profitable to work, although it is represented as much richer than our California gravel claims. The rehabilitation of

Old and Nearly Deserted Camps

And districts may be said to constitute a feature of the year among these restored localities, the Bodie district in Mono county, California, furnishes a noted example. Among other instances of this kind, may be cited Morris City and Moore's Flat in this State. Tuscarora, Cherry Creek and Ward districts in Nevada, together with several heretofore languishing and nearly depopulated camps in Utah and numerous places in the Black hills country. There has been in fact a great deal of this resuscitating work done in a minor way all over the coast. California having experienced her full share of it. Among the towns in this State that present just now a thrifty if not a particularly lively aspect, may be mentioned, Smartsville and North Bloomfield, with several other small places on the San Juan divide. Drytown and Sutter's Creek in Amador county; Placerville in El Dorado; Damascus and Dutch Flat in Placer; Grass Valley and Nevada City in Nevada; Oroville in Butte, besides various camps, hamlets, and considerable towns further north in Trinity and Siskiyou counties, there having been no increase of population or revival of the industry in the more southern portions of the State.

With this improvement of a general kind and the inauguration of more staid and frugal habits, before explained, the era of

Big Strikes, Chispas and Nuggets,

Does not appear to have wholly passed away. Constantly these rich finds are occurring, reminding us of the old-time luck, when miners realized fortunes in a week, and sometimes in a day. And it is probable that these strikes happen oftener than is popularly supposed, miners being more chary now than they used to be about publishing them to the world. The Chinese, who on account of their plodding habits, and peculiar methods of pursuing the business, are remarkably lucky in this respect, but never et their good fortune be known if they can help it, the reasons for this being many and obvious. Very often John's earnings are not wholly his own; he works the claims of white men on shares or he may be obliged to divide the fruits of his toil with certain of his countrymen, being in all cases forced to contribute to a variety of objects in proportion to his gettings, whether honestly come by or otherwise. The possession of wealth in the convenient form of gold dust of course, to be known, greatly exposes him to the despoiler who appears sometimes in the disguised "Melican man," but oftener in the more dreaded agent of the "Six companies," who, through their emissaries, not only are all powerful but well nigh omniscient and omnipresent. But despite his efforts at covering them up these instances of Mongolian success often come to light. A Chinaman working a placer claim at Columbia, Tuolumne county, picked up last summer, a piece of gold worth nearly \$300. A company of these people working a river-bed claim, on the Middle fork of Feather river, took out, not long since, a number of chispas weighing from one to fourteen pounds each, the total value of their find having been estimated at not less than \$15,000 to \$20,000. For a considerable length of time the Chinese were in the habit of selling to the hankers in Placer county chunks of gold weighing from two to 10 ounces each that had evidently been chiseled from a large mass, the entire quantity so disposed of amounting to several thousand dollars. While the Chinese seem to have had more than their share of this good fortune, the latter has by no means been confined to this race. All over the coast we hear of big strikes, valuable ore finds

and nuggets being unearthed or picked up in sluices and from dump-piles by the whites, these instances being too numerous to be mentioned other than in a general way. From Arizona several small lots of remarkably rich ores have been received during the year, the most of them taken from the Silver King and the Stonewall Jackson mine. These parcels of ore varied from 500 to 600 pounds to a ton or more in weight, being independent of much larger shipment of very rich but lower grade ores received from that quarter.

General Aspect and Condition of the Business.

Mining during the year has developed no feature of special interest, nor has anything occurred in connection with this industry calling for particular comment. The business has run along with smoothness and without more than its ordinary causes of excitement. It is coming every year to be pursued like our other great callings, with intelligence and care, and in a quiet, systematic way. Practical mining—for this like many other legitimate vocations, has its speculative side—is being engaged in and followed much like farming, merchandizing and similar pursuits. Its importance in itself and as an aid to our other industries is now fully appreciated and acknowledged by all classes, little of the jealousy once manifested towards it being now shown. Bullion, like wheat, and coal and cotton, has become one of the great staples of the country, and exerts a controlling influence on our national trade and commerce. Mining pays the best wages for labor and the highest price for everything it requires, and it pays with as much promptness and as few failures as any other business.

Bullion Made in 1877.

The bullion production of our mines the past year has been large, exceeding the yield of any former year by more than seven and a half million dollars. That the product has fallen short of the expected round hundred million by a little may be attributed to the drouth that prevailed so generally throughout the mining regions, the bullion like the cereal crop of this coast being largely dependent on the water supply.

The bullion yield of the year is summarized in the following letter of John J. Valentine, General Superintendent of Wells, Fargo & Co.'s Express. It furnishes the most reliable statistics on this subject which it is possible to produce.

EDITORS PRESS:—The following is a copy of our annual statement of precious metals produced in the States and Territories west of the Missouri river, including British Columbia and the west coast of Mexico, during 1877, which shows an aggregate yield of \$98,421,754, being an excess of \$7,546,581 over 1876, the greatest previous annual yield in the history of the country. Arizona, Colorado, Idaho, Nevada, New Mexico, Oregon, Utah and Washington increase; British Columbia, California, Mexico and Montana decrease; but it is possible the falling off in Montana is more apparent than real. In our statement for 1876, Dakota (Black Hills) was not mentioned. It appears herein credited with \$1,500,000 gold, but the estimate is uncertain, as \$950,000 is the total amount carried out by all express companies and mail. The amount named as carried by other conveyances is conjecture. If the Comstock mines yield as much in 1878 as during the past year, the aggregate product of silver and gold will approximate \$100,000,000.

Statement of the Amount of Precious Metals Produced in the States and Territories West of the Missouri River, During the Year 1877.					
States and Territories	Gold dust and bullion by express.	Gold dust and bullion by other conveyances.	Silver bullion by express.	Ors and base bullion by freight.	Total.
California.	\$14,512,128	\$725,006	\$1,201,751	\$1,734,226	\$18,174,111
Nevada.	402,661	108,696	436,277	1,919,897	2,867,530
Oregon.	993,881	8,834	1,191,807	318,499	2,313,021
Washington.	83,410	171,091	202,295	318,499	705,295
Idaho.	1,140,010	184,421	436,277	1,919,897	3,610,605
Utah.	91,104	0,110	1,409,861	6,573,575	8,084,546
Colorado.	3,151,277	31,850	1,394,411	273,840	5,651,378
New Mexico.	31,850	122,857	506,519	1,759,206	2,319,422
Arizona.	950,000	500,000	1,020,636	340,212	2,710,848
Dakota.	721,144	11,653			732,797
Mexico.	1,165,297				1,165,297
British Columbia.	\$24,671,400	\$1,563,331	\$53,600,214	\$10,201,209	\$89,421,754

We have used the utmost care and diligence

in ascertaining the character of bullion and ores reported, with the following result. The yield of the Comstock mines is 45% gold; of the whole bullion product of Nevada, 37% is gold; and of all so-called silver or base bullion, 28% is gold. The gross yield for 1877, shown above, segregated, is, in round numbers, as follows:

Lead, 5 \$5,085,250
Silver, 48 47,200,957
Gold, 47 49,124,547

As lead is an important element in what is herein termed base bullion, we might add that of Missouri and Illinois, value approximately \$1,500,000; which, with the silver and gold of the Lake Superior country, Virginia and North and South Carolina, amount say \$500,000, would swell the gross product to over \$100,000,000 for the year. The lead product of Utah, Nevada and California, exceeds that of the remainder of the United States and Territories combined; and in tonnage is greater this year than ever before, though not exceeding in value that of 1876, the average price having been lower than for many years past.

In our statement of 1876, the amounts credited to British Columbia and west coast of Mexico, were inadvertently carried into the totals credited to the United States, in the estimates given on the right-hand page of the statement. Deducting amounts from the sources named, the results are as follows:

Year.	Production per W. P. & Co. statements, including amounts from Br. Columbia and Mexico.	Production, less amounts from British Columbia and Mexico.	The net product of the United States and Territories west of the Missouri river, divided is as follows:		
			Lead.	Silver.	Gold.
1870..	\$64,000,000	\$52,150,000	\$1,080,000	\$17,320,000	\$33,750,000
1871..	58,264,000	57,784,000	2,100,000	13,256,000	34,336,000
1872..	62,238,500	62,351,824	2,250,000	19,721,429	38,109,305
1873..	72,258,683	70,129,860	3,450,000	27,443,302	39,206,558
1874..	71,401,015	71,935,610	3,800,000	29,699,122	38,406,438
1875..	80,893,057	76,703,433	5,100,000	31,635,239	39,968,191
1876..	90,375,173	87,210,251	5,040,000	33,922,221	42,888,335
1877..	98,421,754	95,511,528	5,085,250	45,846,109	44,889,223

We are uninforming as to the actual exports of silver to India, China and the Straits previous to 1851, but assume that they were less than since that date, which being so, the exports this year are the greatest known, viz.: \$105,000,000 to the 26th inst. The greatest amount in former years was \$83,650,000, in 1857. The amounts exported during the present year were approximately as follows: From Southampton, \$80,000,000; from San Francisco, \$19,000,000; from Marsilles, \$4,000,000; from Venice, \$2,000,000.

We take pleasure in acknowledging the prompt responses of persons applied to for information, and to whose cordial co-operation we are indebted for much of the data necessary to our compilations.

JNO. J. VALENTINE,
General Superintendent.

When we come to recollect that the bullion production of the country for the past four years has been \$343,587,379 in good solid coin, people will appreciate somewhat the importance of the mining interests. This money has been direct production out of the very ground itself, and in getting it thousands and thousands of men have been given employment, and as many families support. This sum is gradually increasing each year, and in all probability will have a production for 1878 of over \$100,000,000 from our mining interests. The falling off in California this year is due entirely to the dry summer and short water season which has prevented the usual yield from the hydraulic mines, which produce the greatest proportion of California's total yield. Judging from the prospects as we write this will not occur the current year. The claims have been idle so long that they have been properly prepared for rapid work when the water comes, and most of them are in better condition than they have been for years.

In this connection the production of coin at the Mint is interesting. The San Francisco Branch Mint made the largest coinage in 1877 of any Mint in the world in a similar length of time. The total coinage for the year was \$49,772,000, in 28,025,100 pieces. The Carson Mint also coined \$4,020,020, making a total coinage of the two Pacific Coast Mints, for the year, of \$53,792,020.

Assessments and Dividends.

Of course the questions of assessments and dividends is an all important one to the owners of mining property. While the bullion production of 1877 was the largest one ever had the amount of assessments has been the smallest for three years. The heaviest assessments as well as the heaviest dividends have come from the Comstock lode. The following table will show the total assessment for several years:

Delinquent in 1873.....	\$ 6,671,000
" 1874.....	6,777,000
" 1875.....	11,880,000
" 1876.....	11,008,000
" 1877.....	11,598,000

These figures, which we take from the *Bulletin*, comprise the total assessments of mines in California, Nevada, Oregon, Utah, Idaho and Arizona. Some of the mines have levied as many as five assessments during the year, which is the full limit allowed by law, as it takes over two months to collect an assessment and the second one cannot be levied until the first is all accounted for. Others levied four; a larger number levied three; and a still larger only two. In a majority of cases only one assessment was collected. The heaviest assessments, exceeding \$100,000, were Alta, \$216,000; Bullion, \$650,000; Baltimore Con., \$168,000; Belcher, \$312,000; Best & Belcher, \$201,000;

Con. Imperial, \$450,000; Crown Point, \$400,000; Caledonia, \$225,000; Chollar, \$224,000; Dayton, \$125,000; Deer Creek, 120,000; Gould & Curry, \$324,000; Golden Chariot, \$135,000; Hule & Norcross, \$336,000; Julia Con. \$330,000; Justice, \$525,000; Lady Washington, \$150,000; Martin White, \$400,000; N. Con. Virginia, \$155,000; New Coso, \$150,000; Overman, \$345,600; Savage, \$560,000; Silver Hill, \$162,000; Utah, \$140,000; Yellow Jacket, \$480,000. With three exceptions these are all claims on the Comstock, but the largest dividends came from that section also. The other mines not enumerated bring the total amounts up to \$11,598,000.

The mining companies paid to stockholders in 1877, in dividends, the magnificent sum of \$25,125,700, about three times as much as all the city, commercial and savings banks, gas, water, insurance, express, powder, telegraph companies and other public corporations combined. The total dividends by local corporations for the year were \$34,366,800, of which the mining companies paid \$25,125,700. This part of the business is not stock jobbing either, but good, solid coin, right out of the ground, and is where the legitimate part of the mining industry comes in to prove its value. And yet there are people who think mining is all a gamble and the sooner it is stopped the better. When they come to consider the figures which shows the results of the year's work and the profits of mining, which exceed by three times all the other corporate interests of the city combined, perhaps it will set them to thinking that mining—that is, real mining, not stock jobbing—sometimes pays after all. There were more mining companies on the dividend roll last year, says the *Bulletin*, than in any previous year since this industry was first prosecuted.

The Black Bear quartz mine of Siskiyou county paid three dividends of 25 cents per share each, two of 40 cents each and one of 50 cents. The Great Western quicksilver mine paid four of 25 cents each. The Empire mine of Sierra county, 13 dividends during the year, equal to \$15.50 per share. The Empire of Nevada county paid three dividends, each of 25 cents per share. The Consolidated Amador of Amador county paid 10 monthly dividends of 25 cents each and then ceased. Since the reorganization of the Excelsior water and mining company, six monthly dividends of 25 cents each were paid in the last half of the year. The South Feather water and mining company paid one dividend of 50 cents per share in August. The Modoc mine of Inyo county paid its first and only dividend of 50 cents per share in January, 1877. The Idaho mine of Nevada county paid seven monthly dividends, each of \$7.50, and five of \$5 per share. The December dividend of this mine made a total of 100 paid since work was commenced. The Centennial mine of Nevada county paid its first and only dividend in February. The Hite mine of Mariposa county paid four monthly dividends, from March to June inclusive, each 20 cents per share. In the early part of the year it was decided to abandon the Eureka mine at Grass Valley, which has been one of the best paying gold mines on the coast. As the result of the sale of certain property and the clearing up of ore and sulphurets, the mine paid three dividends during the year, two of \$2 each in May and August, and one of 50 cents per share in December. These were the only dividends paid by the mine since December, 1873. The LaGrange ditch and hydraulic mining company paid three dividends of 25 cents each in May, August and December. The North Star mine of Grass Valley divided up a small surplus in September, equal to \$2 per share, the first dividend in years, the mine having been abandoned about five years ago. The North Bloomfield gravel mine paid its first and only dividend of \$1 per share in October. The Standard mine of Mono county commenced paying dividends at the rate of \$1 per share in September, and the same rate in October, November and December. The foregoing mines are all California claims. The Idaho mines did not pay a dollar in dividends last year. Two mines in Utah Territory were entered on the dividend list for the first time last year. The Ontario mine commenced paying in March at the rate of 50 cents per share, and paid regular and five extra dividends at that rate during the remainder of the year. The Leeds commenced paying in August, and paid four monthly dividends, each 20 cents per share, and then ceased. It is understood, however, that the present stoppage is only temporary. At the close of the year, two Arizona mines went on the dividend roll, the McMillan mine paying one dividend of 30 cents per share in November, and the Silver King two, each of 50 cents per share, in November and December. We now come to the Nevada mines. Of the hundreds of claims being worked in that State, only seven paid dividends last year, so far as we can learn. The California mine paid 12 of \$2 per share each and the Consolidated Virginia eight of \$2 per share each. These amounted to \$1,080,000 each for each mine. The Eureka Consolidated mines resumed dividends in September, after an interval of nearly three years, and just after winning an important law suit affecting its ore body. During the last four months of the year it paid four dividends, each of \$3 per share. The Manhattan mine paid, last January and February, at the rate of \$1 per share, but nothing since. The Northern Belle mine paid 11 dividends in 1877, at the rate of \$1 per share, and then ceased, making 30 consecutive monthly dividends paid by the mine—a feat accomplished by no other Nevada mine of the Comstock lode. The Rye Patch Consolidated mine resumed

dividends in July, for the first time since March, 1875, and during the remainder of the year paid five dividends of 25 cents each, omitting the one for September. The Grand Prize mine of Elko county, Nevada, paid its first dividend of \$1 per share in September, and another of the same amount in December. The list of Nevada mines is not so large as we hoped it would be, and but for the dividends from the California and Consolidated Virginia, the showing would be insignificant for the present stage of development of the mineral resources of that State.

The bullion produced in this State amounted last year to \$18,174,716, adopting the estimate of Mr. Valentine, whose estimates in this department of statistics, are always conservative, never having been accused of being too large. At the beginning of the year it was generally expected that the mines in this State would turn out at least \$20,000,000, and this, no doubt, would have been the case, but for the almost unexampled dearth of water which cut short the usual period of hydraulic washing fully one-fourth, the business of quartz mining having suffered to nearly a like extent. Being left with much leisure on their hands the miners have generally employed it in obtaining improved machinery and otherwise outfitting their properties and putting them in good shape. If less quartz is crushed, there is also water to be raised from the lower workings of the mines, what militates against one branch of mining often helping another. A low stage of water in the rivers favors the operation of those who wing-dam or by other means seek to work their beds, though it implies a bad season for most other classes of miners.

Between mining employers and employees there have occurred in this State during the year, none of those difficulties that elsewhere have led to bloodshed and riot, no issues touching the question of short hours, wages, etc., having been raised between these two classes. Ten hours, as has always been the case, in the mining regions, is considered a day's work, wages for white men varying from \$2 to \$3 per day, the average being about \$2.50. Only first-class underground miners receiving \$3 per day. In Nevada and all the other mining States and Territories wages average about one-quarter more than in California. Chinamen, where employed, receive from one-half to two-thirds the rates paid white men. These people are not employed as underground hands to any extent except in the drift diggings in this State, where a good number of them are engaged. Some of the large drift companies, however, have never had any of them in their service; and this from principle, as they are admitted to answer very well in this class of mines, save that close watching is necessary to prevent their pilfering the gold, at which they are adepts, stealing often many times the value of their wages despite the vigilance of owners. The Bald Mountain and the North Fork companies at Forest City, the former much the largest in this State, have never employed any Chinamen, nor yet the large and prosperous drift companies about Damascus and elsewhere on the Forest Hill divide.

Quartz Mining.

There are now over 400 quartz mills in California, the most of them fit for and fully two-thirds of them in active service. There are also several cement crushing mills and some 15 smelting works in the State, the former mostly in Placer and Calaveras counties, and the latter all in Inyo county, erected for reducing the smelting ores found as yet only in that district. Of these mills one-half are driven by steam and the balance mostly by water, about 20 being driven by steam and water alternately, as the water may render recourse to steam necessary. In a few instances, these propulsive elements are employed conjointly. The first mill of this kind in the State was put up in 1850, the pioneer locality being a contested but unimportant matter, inasmuch as several of these structures were in course of erection about the same time. Two of these mills, the Phoenix, Amador county, and the Sumner, Kern county, carry each 80 stamps. The Oneida mill at Jackson, Amador county, and the Paloma, Calaveras county, each carry 60 stamps, and the Beaton, in Mariposa county, 64 stamps; the Mariposa mill, also in Mariposa county, carries 50 stamps. Ten to 15 is the average number of stamps to the quartz mills of the State, though quite a good many have from 20 to 40. The six mills belonging to the English company at Sierra Buttes, have 178 stamps, all running on ore from that mine. The greatest number of mills—63—is in Nevada county, the most stamps being in Amador, which contains 41 mills, the same number as El Dorado. The expense attending the erection of these mills has varied from a few thousand dollars or more to \$100,000 or more, their average having been from \$20,000 to \$30,000. About a dozen new mills were put up last year in different parts of the State, besides two or three cement mills and several smelting furnaces.

While quartz mining has been somewhat crippled the past year on account of the drouth, it has still been prosecuted with vigor, having turned out nearly the average amount of bullion with usual profits. Like other branches of mining this is being every year brought into better condition, being carried on with constantly increasing intelligence, economy and system. Improvements, mechanical, chemical and industrial, are in steady progress, and it will not be long till we shall have pretty well overcome the many troubles that have heretofore beset this industry, retarding its progress, har-

ring out profits and rendering it generally unsatisfactory. The trouble of treating our highly sulphuretted and otherwise refractory ores has not yet been conquered, none of the processes aspiring to the accomplishment of that end having fully answered the purpose. We are making progress, however, in that direction, and do not despair of being able to so far overcome these obstacles as to reduce their gravity to a minimum, if we do not vanquish them altogether.

Amador and Nevada counties as ever before have continued the most prosperous quartz mining localities in the State, there having been some revival of this industry in El Dorado and to a lesser degree in Calaveras and Placer, and perhaps some of the more northerly counties of the State.

Hydraulic Mining

As before observed, has suffered serious curtailment the past year by reason of short water supply. Nevertheless some of the companies provided with their own ditches have made a fair, and, in a few instances, a good season's work. The North Bloomfield company, for instance, report a gross production for the year of \$291,125.42. The following two mines belonging to the Milton company report for the same time—French Corral, \$233,003.30, and the Manzanita \$155,713.10. The Excelsior company, at Smartsville, has probably washed out as much as either of the above, while the Spring Valley, at Cherokee, has done a good deal more. The Gold Run, Little York, Nevada, Cedar Creek, Blue Tent, and several companies on the San Juan and Forest Hill divides have made many large clean-ups during the year, and have probably not fallen much below their average production. Meanwhile the outlook for this branch of mining for the present year is good, and growing every day more encouraging, the late copious rains affording them water for present washing, and it only requires that these should be followed by a large accumulation of snow in the Sierra Nevada to insure for this interest a prosperous year.

As a general thing our hydraulic miners employed the leisure afforded them by the late dry summer to a good purpose. Some new ditches have been constructed and the old ones everywhere cleaned out and repaired. Much iron pipe has been substituted for wooden flumes and other less secure and permanent structures. Branches for conducting water from the main canals into new localities have, in many instances, been built, the main trunk having also in some places been extended. Several of the larger and more prosperous hydraulic companies, such as the Milton, Blue Tent, etc., have greatly enlarged their old reservoirs or built new ones, thereby much increasing their summer stock of water. Many of the pits have been opened with long bedrock tunnels, admitting of the lower and richer strata of ground being worked and receiving permanent outlet and drainage.

The length of main canals that have been built in this State, mainly for the purpose of supplying this class of mines with water, aggregate fully 6,000 miles, exclusive of 1,000 miles of subsidiary ditches, designed for carrying the water into lateral localities or otherwise securing its proper destination. A great many reservoirs of large capacity have also been built for water catchment in the mountains; the money expended on these improvements amounted, first and last, to \$25,000,000. For opening and outfitting claims, and bringing them into condition for washing, large sums have also been expended, to say nothing of the money laid out in the purchase of these properties. The heaviest expenditures made on account of these artificial structures for the storage and conducting of water have been in Nevada county, El Dorado, Placer and Amador ranking next. The most costly enterprise of this kind has been the South Yuba canal, Nevada county, though the outlay made on the properties of the North Bloomfield, Milton, Eureka Lake, El Dorado Deep Gravel and the California Water companies, has not been much less.

Drift Mining

Like hydraulic is a branch of the business not much practiced outside of California, it being even here of secondary importance. It is pursued by tunneling through the side rims of the old pliocene rivers and other deep lying gold-bearing channels, and removing through the adits so opened their auriferous contents, these having been first drifted or dug out with picks. Though not new, having been followed in this State from the first, it is only within the past few years that it has assumed large proportions. It was in searching after this class of deposits that the early miners suffered so much; many of the tunnels run by them having proved failures, through ignorance as to the proper levels upon which they should be driven. Experience having enabled them to correct these mistakes, the drift mining has since been carried on with more success. Most of the companies carrying on this business are made up of practical miners; Slate Creek, Forest City and Damascus being the sites of the most extensive operations. A great many companies have been formed during the past year and the probabilities are we shall see an early expansion of this business, as it has little risk and frequently pays well.

Nevada.

In the data connected with the principal mines in this State, as above presented, will be found the most important facts bearing on its general mining interests, which, as a whole, have

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL,
MINING ENGINEER AND METALLURIST.

Roasting of Gold and Silver Ores, and the Extraction of their respective Metals without Quick Silver.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.

Price, \$2.50 coin, or \$3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniures, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers, containing, as it does, much essential information to the Miner, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, \$7.50.

HOW TO ADVERTISE.

The following views of some of our most successful business men, say an exchange, will be very generally concurred in.

"The tawdry lithographs so freely used by certain manufacturers neither express good sense nor good taste; they suffer even by comparison with the comic valentine, for although the latter is essentially vulgar, and frequently a hurtful missile in the hands of a foolish or a malicious person, it means something; it has about it some touch of humor—it tells for what it was designed. But the stove manufacturers' valentine, I mean the red and yellow lithograph, has no redeeming qualities about it. At best, it announces the thoughtlessness or want of dignity of its author; and it does not hint with a certain degree of positiveness at the probable inferiority of his wares, it is less injurious than I have been inclined to regard it.

"Hence advertising cannot be too emphatically condemned; to characterize it as vile is scarcely to do it adequate justice. It is primarily objectionable, because it brings the manufacturers who wish to advertise into doubtful company on the public highways; and every prudent business man must know, if he has given to his advertising the careful attention it deserves, that the money devoted to papering fences is utterly wasted. We know a gentleman who expends \$150,000 annually for advertising, but you cannot find his name on the fences; he is the best advertiser in the country, but there is nothing comical or grotesque about his way of doing business.

"The glaring poster neither inspires confidence nor conveys the information the public desire, and if we would make the best possible use of our money in giving publicity to our claims as manufacturers, we should patronize able and responsible newspapers. The newspaper is immeasurably the best medium open to our trade; the most liberal and expert advertisers testify to its value; and in the employment of its columns we would find a means of escape from the wasteful, undignified and ineffective methods to which so many now resort in their eager desire to secure attention and patronage."

OUR AGENTS.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. L. THAYER—San Francisco.
B. W. CROWELL—California.
C. C. KNOX—Pacific Coast.
A. N. WEST—Santa Cruz, Monterey and San Benito counties.
A. C. CHAMBERLAIN—Tulare, Fresno and Inyo counties.
EDWARD S. BAKER—Australian Colonies and Sandwich Islands.
J. D. WHITE—San Bernardino and Los Angeles counties.
J. W. A. WRIGHT—Sacramento, Placer and San Joaquin counties.
B. E. LLOYD—Alameda, Contra Costa and Napa counties.
E. M. DENNY, Oregon.
P. B. ANDERSON, Nevada.
H. E. HALLETT—San Joaquin, Yolo, Yuba, Sutter and Colusa counties.

Thanks for Six Patents, Etc.

SACRAMENTO CITY, November 23, 1877.

MESSES. DEWEY & Co.—Dear Sirs:—Please accept my thanks for the prompt and successful manner with which you have conducted my business in obtaining patents for my brick, and a smelting and condensing furnace, making six patents I have obtained through your agency. Four of the above patents were for the purpose of saving fine gold, quicksilver and amalgam, and the concentration of ores of all kinds. I can cheerfully recommend the firm to all with whom I may come in contact, especially inventors. I remain, respectfully yours,
GEO. R. EVANS.

THERE are many persons who do not know how to stop a newspaper. They are more awkward about it than a country boy stealing his first kiss. The way to do it with satisfaction to both sides is to address the publisher by letter if you do not live near enough to call at his office. It is no way to notify the postmaster or some one else. Four postmasters in three will fail to notify the office of publication. They look upon it as your business more than theirs. The right way is as gentle and pleasant as the other is suspicious and shabby. If you owe for a few weeks or months over time, tender the amount due. It is a little thing, but will be a great satisfaction to your conscience, as every one is presumed to have one of some kind. Stop your newspaper like a man, and your own self-respect and the esteem of the publisher is maintained. Then you can always look him in the eye or take him by the hand, and he will feel proud to think you were once one of his most gentlemanly patrons, and wish you would subscribe again.—Exchange.

THE BEST FILEHOLDER.—After having used Dewey's patent elastic hinge fileholder for over a year past, the *News* cheerfully indorses it as the best newspaper fileholder in existence, possessing important advantages over any and all others in use. The holders are neat, light and convenient, and the newspapers are placed in them with the utmost facility and least possible time and exertion. They are the simplest, handiest and cheapest of all. Any body keeping files of papers in reading rooms, offices or at home, should send at once to the proprietor, A. T. Dewey, San Francisco, and get the only proper fileholder. Samples by mail fifty cents.—*Gold Hill News*.

A VALUABLE MINING BOOK.

BY J. S. PHILLIPS.

The Explorers', Miners' and Metallurgists' Companion, 682 pages, 33 illustrations. Second Edition. A California publication.

OPINIONS OF THE PRESS.

The book is exactly calculated to suit the views and meet the requirements of those for whom it has been written.—*London Mining Journal*.

The most practical and comprehensive work on mining subjects extant, and valuable book of reference.—*Mining and Scientific Press, San Francisco*.

We know of no work on these subjects in the English language at once so comprehensive, practical and intelligible.—*S. F. Golden Era*.

He has rendered to the leading industry of the coast a valuable service—has furnished the millman and miner a safe and much needed practical guide.—*Overland Monthly*.

This book, which treats in an intelligent and practical way on almost every topic connected with mining pursuits, should be in the hands of every millman, metallurgist, prospector and miner on the Pacific coast. Even the capitalist, and, in fact, every person already engaged in, or likely to become interested in the business of mining, will find in this comprehensive work an amount of information that cannot afford to dispense with.—*S. F. Commercial Herald*.

This book is free from trash, and solid throughout; all its matter is intelligible to men of ordinary education, and all of it is valuable to miners.—*S. F. Daily Alta*.

In the several sections the work is eminently practical. Is very comprehensive, and contains a great deal of useful information which cannot be obtained from the previous books that have been written on these subjects.—*S. F. Daily Examiner*.

It affords a vast quantity of information as to the appearance and value of different ores.—*S. F. News Letter*.

It is the best single English treatise we know for the use of prospectors and practical miners.—*The Engineering and Mining Journal, New York*.

Sold by Dewey & Co., at this office. Price \$10.50.

Testing and Working Silver Ores.

The above is the title of an illustrated work of 114 pages, for miners and prospectors, by Chas. H. Aaron, which has just been issued by Dewey & Co. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope:

Under the heading of the first chapter, "Testing Ore for Silver," we find paragraphs on ore formation test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working same, appliances for testing, roasting, etc. Under the heading of "Working Ores" the author describes Aaron's process, has something to say of superheated steam, preparation of dichloride of copper and protochloride of copper, use of copper and iron, quantity of chemicals, carbonate of lime chloride ores, amalgam, Patehen's process, etc. He also describes the methods of working roasted ores, treatment of base metals, stirring, heat of furnace, want of sulphur, etc. Under the heading of "Leaching Processes" are the titles, Smelting, Mexican process, Chilean process, Kroebe's process, etc. Under "Pulverizing Machines" are described the arastra and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Noice's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, grinding the ore, directions for making a barrel, preventing mechanical wear, use of quicksilver, copper in bars, Freiberg barrel, cheap barrel trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improvised retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous mention may be found Aaron's leaching apparatus, with two or three different arrangements, a small mill, smelting tailings and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

The book is a serviceable one for miners and prospectors' use. Price, post free, \$2.00. Address Dewey & Co., MINING AND SCIENTIFIC PRESS, 202 Sansome Street, San Francisco.

Questions of the Times.

Which are the most reliable watches?

American watches, they are driving those of foreign make out of the market.

Which is the best American watch?

The Hampden watch, made at Springfield, Mass.

Why is it the best watch?

Because it is substantial in all its parts, constructed on the best principles and embodies those improvements which experience has shown to be most desirable.

Why is the Hampden watch so popular?

Because in buying one you are sure of getting a good time-keeper. While purchasing a watch of most other makes is like investing in a lottery—a great many blanks to one prize.

Which is the cheapest watch?

The most economical is the Hampden watch. For you can get one of these excellent time-keepers for less than it costs in a short time to run up a poor watch, which benefits no one but the repairer.

Where can I get a Hampden watch?

By addressing the long established, practical watchmakers and jewelers, DEWEY & JORDAN, 433 Montgomery St., San Francisco, who will send you a descriptive price list, including the following styles of movements: "John Hancock," "Geo. San Ricca," "Chas. E. Hayward," "Aaron Bag," "Theo. E. Studley," "Chester Wolworth," "Frederick Billings," "Railway," "John L. King," "E. W. Bond."

TO QUERISTS.

In propounding questions to the editorial, patent or business departments of this office, letter writers should be careful to enclose a stamp and addressed envelope if they wish prompt answer. If we were to furnish time, paper, envelopes and stamps, all free to parties who address this office on matters of more interest to themselves than to us, FIVE HUNDRED DOLLARS A YEAR would not cover the expense. This, however, is not intended for parties writing in our own or the public interest, or who would be obliged to delay writing at any time for want of an extra stamp.

Books for the People.

For Sale on the Pacific Coast at the

Lowest Cash Price, by

DEWEY & CO.,

Publisher of the PACIFIC RURAL PRESS,

DEWEY & CO., Publishers,

202 Sansome Street, San Francisco.

Mining and Scientific Press

Is the leading mining journal in America, and enjoys a large circulation among the more intelligent operators and workers in the gold fields of the world.

As a scientific and mechanical representative of the Pacific Coast, it is decidedly popular and a standard journal with the most thrifty industrial people of the Pacific States and Territories. Its authority is of the highest order, and its usefulness in its special sphere unrivaled.

Every public library, mining engineer, metallurgist, mining operator and intelligent mechanic and manufacturer will find profit by its reading.

Subscription, \$4 a year in advance. Sample copies, post paid, 10 cents.

DEWEY & CO., Publishers, S. F.

PACIFIC RURAL PRESS.

A first-class 16-page Illustrated Agricultural Weekly, filled with fresh, valuable and interesting reading. Every farmer and ruralist should take it. It is immensely popular. Send for a sample copy.

DEWEY & CO., Publishers, S. F.

EVERY new subscriber who does not receive the paper and every old subscriber not credited on the label within two weeks after paying for this paper, should write personally to the publishers without delay, to secure proper credit. This is necessary to protect us and the subscribers against the acts and mistakes of others.

American & Foreign Patent Agents

OFFICE, 202 SANSOME ST., N. E. COR. PINE, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

Canadian Patents for U. S. In-
ventors and Patentees.

One Patent now Embraces all the English
Provinces in North America, including
the Canadas and British Columbia.

It is only recently that the Canadian Government has granted patents to United States citizens. In consequence hereof the many immensely valuable inventions patented in this country are now patented in Canada. Patents are much sought for and are readily disposed of at fair cash prices. In our country about three-fourths of all manufacturing is based upon patents, especially in the New England States no manufacturing business of any consequence is started without being protected by such. Our neighbors across the border have not been slow in observing and learning that inventions and patents are the foundation of all prosperity in manufacturing purposes. Hence all our patents for labor saving and agricultural machinery and innumerable improvements in home comforts meet a ready market in Canada. Inventors and Patentees should therefore not delay to secure their patents in Canada; many good inventions are already pirated by Canadians, who, against law and right, appropriate United States inventions and have them patented in their own name. After a patent is granted it is extremely difficult to prove who is the first and original inventor. Therefore, inventors and patentees to be safe, you will have to secure your patents in Canada without delay. We have facilities for securing Canadian patents second to none. Our charges for securing Canadian patents are about \$65. A model is required.

Inventors and patentees! do not delay and lose your opportunity. Things may change. With model and description of your invention remit \$25, and we will prepare all drawings and documents and forward them to you for signature. In about 30 to 50 days we can return your Canadian patent.

DEWEY & CO.,
Patent Solicitors, S. F.

UNITED STATES
Mineral Land Laws, Revised Statutes,
AND INSTRUCTIONS AND FORMS
UNDER THE SAME.

We have just issued a pamphlet containing the General Mineral Land Laws of the United States, with instructions of the Commissioner of the Land Office. The contents of this pamphlet comprise all of the Government laws with relation to mineral lands of interest to the mining community, as follows: Mining Statute of May 10th, 1872, with Instructions by the Commissioner of the Land Office; Mining Statute of July 26th, 1896; Mining Statute of July 9th, 1870. Forms required under Mining Act of May 10th, 1872, as follows: Notice of Location; Request for Survey; Application for Patent; Proof of Posting Notice and Diagram of the Claim; Proof that Plat and Notice remained Posted on Claim during Time of Publication; Registers' Certificate of Posting Notice for Sixty Days; Agreement of Publisher; Proof of Publication; Affidavit of \$500 Improvements; Statement and Charge of Fees; Proof of Ownership and Possession in Case of Loss or absence of Mining Records; Affidavit of Citizenship; Certificate that no Suit is Pending; Power of Attorney; Protest and Adverse Claim; Non-Mineral Affidavit; Proof that no Known Veins Exist in a Placer Claim, etc. There is also given the U. S. Coal Land Law and Regulations thereunder. The work comprises thirty pages, and will be sold, post-free, for 50 cents. It should be in the hands of every one having any mining interests. DEWEY & CO.,
Publishers of the MINING AND SCIENTIFIC PRESS, S. F.

Contents of Pamphlet on Public Lands of
California, U. S. Land Laws, Map of
California and Nevada, Etc.

Map of California and Nevada; The Public Lands; The Land Districts; Table of Rainfall in California; Counties and Their Products; Statistics of the State at Large.

Instructions of the U. S. Land Commissioners.—Different Classes of Public Lands; How Lands may be Acquired; Fees of Land Office at Location; Agricultural College Scrip; Pre-emptions; Extending the Homestead Privilege; But One Homestead Allowed; Proof of Actual Settlement Necessary; Adjoining Farm Homesteads; Lands for Soldiers and Sailors; Lands for Indians; Fees of Land Office and Commissioners; Laws to Promote Timber Culture; Concerning Appeals; Returns of the Register and Receiver; Concerning Mining Claims; Second Pre-emption Benefit.

Abstract from the U. S. Statutes.—The Law Concerning Pre-emption; Concerning Homesteads; Amendment Act Concerning Timber; Miscellaneous Provisions; Additional Surveys; Land for Pre-emption; List of California Post Offices. Price, post paid, 50 cts. Published and sold by DEWEY & CO., S. F.

A JOB PRESS WANTED.

Any printer having an Eighth or Quarter Medium Job Press for sale, will please address J. P., care of Dewey & Co., S. F. State condition and lowest price.

Fig.1

PATENT ELASTIC HINGE
FILEHOLDER
A.T. DEWEY, S.F. CAL.

Fig.2

Among the advantages gained by this holder are the following:
It can be opened and closed quickly.
The points are less obstructed while the articles to be filed are being placed.
The papers (wholly or partly folded) can be either "straddled" over the lower bar, or filed in regular book order.
The elastic hinge and band accommodate and hold firm either a large or small number of papers.
With less material, it is lighter and less cumbersome than other holders, and approaches nearer to bookbinding. It has no rigid hooks, hinges or loose parts to break or get lost.
It has proved durable in practice. The file is adjusted but 52 times a year for a weekly paper, and a sample holder can be opened and closed 1,000 times without showing wear.
Five sizes are made to suit the dimensions of different papers, viz.: 13, 22, 26, 30 and 34 inches, inside measure. Single samples will be mailed from office for 50 cents, (and upward, according to size), postpaid. Wholesale and retail agents wanted.

REGISTER YOUR
TRADE
MARKS.

The U. S. Government now offers greater protection than formerly to manufacturers under the law of Trade Marks.

Those who manufacture a superior article, or put up improved packages of merchandise, should protect themselves from imitations by registering their Trade Marks.

We have special facilities for securing full rights by the registration of Trade Marks, and our terms are very reasonable.

Consultations free. Many dealers have missed fortunes from not being fully informed and protecting themselves in their rights.

THE O'HARRA CHLORIDIZING FURNACE

Guaranteed to Chloridize from 85 to 95 per cent. of any gold or silver ores that are not more profitable for smelting. Will also desulphurize ores and put them in proper shape for working in cupola furnaces.

Cost of Roasting and Chloridizing 20 Tons in 24 Hours by this Process:

One man.....	\$ 4 00
One man.....	3 00
Wood—2½ cords at \$5 per cord.....	5 25
Salt—1,600 lbs at 2½ cents.....	40 00
Cost of 20 tons.....	\$52 25
Cost of one ton.....	2 61

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

The furnace is now working successfully at the Poe, Con solidated Co.'s mines, in Peavine District, Nev., and at the Eschexer mill, Alpine Co., Cal. For further information, apply to

YOUR NAME printed on 50 mixed cards for 13c. 25 full cards 10c. OLINTON BROS., Clintonville, Conn.

\$1,000 Challenge Ore Feeder.

HENDY'S \$1,000 CHALLENGE ORE FEEDER.

I call my Automatic Ore Feeder the \$1,000 Challenge, because I challenge the owners or backers of any other feeder to a competitive test for that amount. As Mr. C. G. Rodgers, Superintendent of the Green Mountain mine, near Greenville, Plumas county, appears prominently as a detractor of the merits of my feeder, and seems confident that another one is better, perhaps he will accept this long-standing challenge which the owners of other patents will not, and give me an opportunity to prove publicly the superiority of my machine. As to Mr. Rodgers' assertion about my feeder wearing out, it is no less fallible in that respect than other machinery; but I have over 250 now in use, some of them for over two years, and have never had to expend 25 cents for repairs. The fact that my feeder received the premium at the late Mechanics' fair, and that I am shipping several feeders weekly to different parts of the country, is sufficient proof of the appreciation in which it is held.

As to my feeders having been thrown out of the Gold Stripe mill, they were not displaced for inefficiency, as the following letter will show, and it answers also as a complete refutation of Mr. Rodgers' statement:

OFFICE SUPERINTENDENT OF THE GOLD STRIPE G. M. CO.,

GREENVILLE, PLUMAS CO., OCT. 16TH, 1877.

JOSHUA HENDY, Esq.—Dear Sir:—Your favor of the 15th instant at hand. In reply to your inquiry as to the working of your ore feeders at our mill, we can say that there is no fault in the machines, and we consider them the best now in use. At present they are not in use with us, owing to the construction of the mill, which we are about to rebuild and make proper arrangements for putting in your feeders.

J. K. OWEN.

Superintendent Gold Stripe Mine.

One of the principal owners of the Gold Stripe and Green Mountain mills is also largely interested in the Plumas National mine, where I have just shipped several feeders, showing the confidence placed in the machine by these gentlemen who have used it.

Now, if Mr. Rodgers is sincere in his belief as to the merits of a rival machine over mine, here is a chance for him to make a thousand dollars easily, if he can get the owners of the machine to lend him one for the trial, which is the only doubtful thing in connection with the matter. Mr. Rodgers' eight months' experience with both machines ought to give him confidence enough in his own convictions to accept the challenge offered to him, or any one else.

JOSHUA HENDY.

Corner Fremont and Market Streets, San Francisco.

It may be considered as now fully demonstrated, by careful and long-continued experimentation, that the plan upon which a perfect ore feeder must be constructed is that of the carrier, and not that of the shaking table. Uniform and accurate feeding is not possible upon the latter plan. The ore must be evenly carried, upon a steadily advancing plane or table, to the line of discharge, and there simply dropped. Spasmodic or jerky contrivances will not answer the purpose.

We warrant the machines to give perfect satisfaction, and to be a better and more durable Feeder than any other the market, and will sell them as cheap as any other of its class.

ING AND SCIENTIFIC PRESS extends through-
out the mining districts of California, Nevada,
Utah, Colorado, Arizona, Idaho, Montana-
British Columbia, and to other parts of North
and South America. Established in 1860, it
has long been the leading Mining Journal of
the continent, its varied and reliable contents
giving it a character popular with both its
reading and advertising patrons.

To Mill and Mine Owners.

Having made arrangements with competent and re-
liable parties in Washington City, by which we will be
able to secure prompt and careful attention to our busi-
ness, we are now prepared to assist Mill and Mine, Canal
and Ditch owners in securing patents for their lands,
mines and claims, in addition to our former line of patent
business.

Many who are acquainted with the manner in which
this business has heretofore been conducted, (with or
without assistance by local attorneys,) will see at once
the great advantage of patronizing an establishment that
is thoroughly organized and has its representatives in
Washington to look after and prosecute their applications
before the Commissioner of the General Land Office.
The business on this Coast will be attended to by JOHN
L. BOONE, Esq., Attorney-at-Law, one of the mem-
bers of this firm.

Correspondence from persons desirous of securing
patents for Lands, Mines, Mill Sites, Canal and Ditch
property, promptly attended to.

VOLUME XXXVI.
Number 4.

The American Pipe Company's Pipe.

Some 18 or 20 years ago the Wyckoff pipe was introduced into the Eastern States, and at once attention was attracted to its peculiar adaptation for the purpose of conveying gas or water. It was found that when compared with iron, the wooden pipe was not only cheaper but better for certain purposes, and in March last an organization styled the American Pipe Company was organized in this city with a capital stock of \$250,000, for the purpose of manufacturing this pipe and thoroughly introducing it on this coast. The officers of this company are Robert G. Byxbee, of the firm of H. B. Ticknor & Co., President; John E. Chalfant, formerly of the Mendocino Lumber Company, Vice-President; John F. Byxbee, of Duncan Mills has Lumber Company, Secretary and Treasurer; Calvert Meade, Auditor; P. T. Dickinson, who been for the last 20 years connected with the manufacture of this pipe, General Manager. On the organization of the company a mill was started at Olympia, Puget sound, W. T., where the lumber is prepared, when it is brought to this city and taken to the factory of the company, on Channel street near Fourth, where it is finished ready for use. Some 50 or 60 men are employed at both places. The manner of making this pipe is peculiar, but may be easily understood by referring to the accompanying engravings. Fig. 1 shows a completed pipe; Fig. 2 the horizontal section and connections; Fig. 3, cylinder of wood; Fig. 4, bands of iron; Fig. 5, coating of hydraulic or asphaltum cement. It is made in sections of eight feet long, from Puget sound pine or Oregon fir. It is first bored, and then turned in a lathe to a uniform thickness of shell, removing all of the sap, and steamed thoroughly, to avoid any possibility of checking, or tasting the water. One end of each piece has a tenon of about three and a half inches, and the other is mortised to fit it closely. The swelling of this tenon, when driven home, makes a perfectly tight joint. The pipe is now ready for banding. This is done by winding the iron spirally around it, of a thickness, and at intervals required by the pressure to be sustained. The iron is coated on the under side as it is wound upon the pipe, and then the entire pipe and iron are thickly coated with asphaltum, producing a condition best calculated to resist decay in any form. The water pipe is coated on the outside only, as it is a well-known scientific fact that water, either salt, alkali or sulphur, does not affect wood, and in this city this pipe is used at the Mint to carry off the waste acids, while it is as well known that water will find the smallest crack in the inside coating of iron pipe, and cut its way out in a few months.

The gas pipe made by this company is made the same as the water pipe, except that it is coated inside, and is not bound as heavily with iron; and one great feature of the gas pipe is that it prevents condensation. Many severe tests of this pipe have been made, and when it is known that the pipe has been used in the East for the last 18 years, and nearly 1,000 miles of it have been thoroughly tested; that it has been brought into immediate competition with the best iron pipe; and when taken up to lay larger pipe, it has been found perfectly sound, and every foot relaid.

A very fine endorsement of this pipe is made by E. M. Morgan, Esq., Chief Engineer and Superintendent of the Santa Cruz Water Works, where it has been in use two years. They have 200 feet pressure all over the town, and he says he can lay 1,250 feet of six-inch pipe per day with four men, and that in all ways, tapping, laying, etc., the expense is far less than iron pipe. That this pipe must eventually come into general use, there can be no doubt, for it possesses the following advantages over any pipe in the world: 1st, it is the cheapest good pipe; 2d, it is the most durable of all pipes—practically imperishable; 3d, it neither expands nor contracts, and corrosion is impossible; 4th, it is more easily laid—can be tapped with an ordinary auger; 5th, it is more easily handled—lighter in weight, and perfectly tight; 6th, it is not liable to get out of order; 7th, it need not be laid so deep, and in cold climates will not freeze so quickly; 8th, when used for

water, it neither tastes of, or can be affected by, chemical ingredients; 9th, when used for gas it prevents condensation.

The President of the Santa Cruz Water company, Henry K. Moore, Esq., thus endorses the pipe in a letter addressed to the manager of the company: "I cheerfully comply with your request for my views respecting the Wyckoff combination pipe furnished by your company to the Santa Cruz Water company. Over 11 miles of the above pipe have been laid in the city of Santa Cruz. It has been in constant use for nearly 18 months under a pressure of not less than 150 pounds, and has stood the pressure admirably. We find that it works in every respect to our entire satisfaction, and we shall most decidedly give your pipe the preference in all extensions to be made by our company. In our opinion this pipe has decided advantages over iron pipe, such as saving of time and labor, in tapping and making connections, ease in repairing, cleanliness of water flowing in it, and great saving in cost and freight. With us the pipe is a success, and I can unhesitatingly recommend its use to any town or corporation, or persons desiring pipe for water works of any kind."

In June last this pipe was introduced upon the Central Pacific railroad and its branches for all purposes where pressure is required, and the

PATENT WOODEN PIPE, FOR WATER, GAS, ETC.

officers of the road give it their hearty endorsement. Since that time they have laid about 50,000 feet, and it is now superseding all other kinds of pipe.

By a special order issued from the War Department this pipe is now being used at all military posts, and it has been hauled over 400 miles into Arizona, to be used at Camp McDowell, where it gave entire satisfaction.

For use in mining purposes this pipe would be very economical. It possesses great strength and durability, and can be made to withstand a very heavy pressure. A great desideratum, acknowledged by all, is the ease with which it can be transported to the mines.

Messrs. J. S. and C. H. Briggs, owners of the Briggs mine, Central City, Colorado, write: "We take pleasure in recommending the pipe made by the American Pipe Company to miners in particular, as we have tried it in our Briggs mine, at Central City, Colorado, and found it better in every respect than we expected. We would not use iron pipe if it did not cost a cent a foot, if we could get the wooden pipe."

The American Pipe Company, as now organized, is an active company, with ample capital, and they are energetically introducing the pipe in every direction. The office is at 22 California street.

The Southern Pacific Railroad Company offer 1,000 men work at \$1 per day until they can find something better. The men are to be paid every night.

Ball's Excavator.

We witnessed this week, on the corner of Ninth and Franklin streets, Oakland, the operation of the Ball excavator, which is at work there. The machine is the first one of the kind which has been built, and has been examined by a number of persons interested in excavating machinery. It is intended for cutting canals, ditches, making excavations, and work of that character. The digging apparatus is a series of endless chains and buckets, many points in the machine being new improvements, and the whole is covered by several patents.

The main frame of the machine is V, or triangular shaped, being supported by a wheel at each of the two angles at the rear end of the frame, and at the other angle, or forward end of the machine, are two wheels very close together on a shaft, which are so placed as to be governed to steer the machine; by power derived from the engines, these two wheels also propel the whole machine forward or backward, as the necessities of the work demand.

Upon and inside of the bed-frame is another

so as to allow the machine to stand on the surface of the ground to be excavated.

This machine weighs something less than 10 tons, has two engines with 6x12-inch cylinders, with upright boiler of sufficient capacity. There are 12 buckets now on the machine, but it is intended for 11 more when the machine is set at regular work. The buckets weigh 102 pounds each, and hold about 2½ cubic feet.

The inventor, Mr. John A. Ball, claims that when the buckets are all (23 in number) on the machine it will excavate in ordinary upland hard ground an average of 1,000 cubic yards a day of nine hours. Aside from the boiler and engines there is very little wear except the wearing of the friction rollers on the chains and on the edges of the buckets. By having on hand extra pieces the worn-out ones can be readily taken off and repaired or new ones put on. It does not require more than 10 minutes to take off a bucket and put another on, which can be done out of working hours.

The machine now will cut at one stroke, without being moved, 28 feet wide and 10 feet deep, or will cut anything less in depth or width. If deeper excavation is required the ladder carrying the endless chain and buckets is extended to a greater length, no other changes being necessary. If a canal is to be more than about 40 feet wide it would be advisable to make more than one cut, in which case the second would be alongside of the first but would reach into the first and yet the machine would travel on the surface of the ground forward of its cut or excavation. By the simple moving of levers the depth or width of cut is regulated, the ladder hoisted or lowered, buckets moved to one side or the other, or the machine moved ahead or backward. The buckets cut a shaving of earth of the slope on which they are acting, and the thickness of this shaving can be regulated to the closest degree. In fact the buckets act like a planing machine on the earth. The work being done now is simply to demonstrate the effectiveness of the machine. Those interested in such machinery may see it at the locality indicated above. As far as we could see, in the place it is now at work, it appears to accomplish the object for which it is intended in a satisfactory manner. The buckets come down the ladder on the top side of the ladder and go up underneath in the same manner as the dredging apparatus devised by the same inventor.

CALIFORNIA'S CLIMATE.—Mr. B. B. Redding's article on the climate of California, to which so much of our space is devoted this week, ought to be widely circulated at home and abroad. It forms the most accurate and intelligent synopsis of the causes of the varieties of climate experienced in different parts of this State that has ever been published. In fact, there are few competent to handle the subject as Mr. Redding has done, his facilities for obtaining statistics being unexceptional and his interest in the matter great. He has had abundant opportunity for observation from one end of the State to the other, and has spent a great deal of time in collating data, so that nothing like this article has been written in California before. It will form a nucleus, or grand starting point, for the collection of further facts, and we should be pleased to see any comments or further information which it may elicit. We have no doubt that Mr. Redding would be pleased to get the views of others who are interested in the subject and have paid any attention to it. Mr. Redding is a disinterested, public-spirited gentleman, who has greatly benefited the State by his labors as one of the Fish Commissioners, and in many other directions; and that he is a searcher after scientific truths may be seen by reading what he has written on the climate of California.

The accident at the Savage mine this week by which a miner was precipitated down the shaft, and three more came near being killed, is attributed to the engineers being overtaxed by working a 12-hour shift. The cage was drawn up into the sheave although the indicator was all right, showing that it must have been inattention on the part of the engineer. A move is being made to have the hours of labor for engineers reduced.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents—Eds.

From Globe District, Arizona.

EDITORS PRESS:—We had a visit recently from Messrs. Samuel McMasters and I. M. Taylor, of San Francisco, and Mr. C. D. Angell, the representative of heavy operators in the oil regions of Pennsylvania, was here at the same time. After looking around for a few days, these gentlemen joined together and purchased the Byron and Bixby mines—referred to in my letter printed in your issue of December 1st—about seven miles from this place. The lodes alluded to are nearly a dozen in number and each shows a strong out-crop of high-grade chloride ore. The Isabella, one of the series, was incorporated, in your city, in November, and is now being opened by an incline on one side of the vein. This incorporation will be merged in the new company, which, commanding abundant means, will carry on operations in a way to secure large and rapid returns. The old Morrill & Ketchum mill-site has been purchased and it is believed that in about four months a complete quartz mill, with necessary roasting furnaces, can be got ready to go into operation. Mr. Thomas McMasters, one of the best silver mill-men on the Pacific coast, will have charge of the mill, and Mr. H. G. Bixby will carry on the mining work for the new company.

The mines secured by the purchasers are of great value. Even if the ore in sight only goes down 20 feet, not to speak of deep mining, several thousand tons will be obtained at small cost, and it is quite safe to estimate this ore at from \$300 to \$400 per ton, just as it comes from the ground, no careful assortment being necessary. On almost any one of the claims, pieces of ore, coated with horn silver, can be picked up, which will give very high assays.

The new mill will be a "custom" one in this sense. Miners bringing in ore, will have it crushed and sampled in the usual way and be paid for it at fixed percentages, according to the assay. In securing low-grade ores, the mill-manager will be enabled to regulate his weekly yield of bullion by mixing them with the company's rich ores, and miners owning good claims will obtain by their own efforts the means to open them.

A New Discovery.

A young Scotchman, of the name of Watson, who had been two years in the district without finding any claim of value, made a fine discovery a week or two ago. He was hunting deer and got upon a rocky ridge, where he never would have thought of climbing in the hope of finding mines. Following some pieces of rich float, he came upon two lodes, now known as the Etna and Silver Era. The former is a well-defined vein, about four feet wide, with ore that will yield several hundred dollars per ton. The latter is less regular than the former, but it has a streak, 8 to 10 inches wide, which assays over \$2,000 per ton. On the two claims there are several thousand dollars' worth of ore, which the owners can extract with very little labor. A new discovery has been made south of the Miami mine and a rich streak of chloride has been uncovered.

The Great Future of Globe District

Is more and more impressed upon my mind as my knowledge of its immense mineral belt is increased. I have counted at least 55 distinct parallel veins, from 300 to 500 feet apart, which have been traced or are traceable along their strike, for from 10 to 25 miles. Of course these ledges do not all show ore on the surface, but here and there over the entire belt, rich ore, at least, promising ore bodies and indications of such have been found. From three to six lodes seem, in most cases, to come from a common source; that is, two or three pitch westerly and three opposite and parallel to them pitch easterly or toward the others. In such a series there is usually one lode that, in respect to size, walls and quality of ore, looks superior to the others. I have been over a large part of eastern Nevada, and though what I am about to say may offend mine owners in that region, I yet assert, after a careful and very extensive survey of Globe district, that it unquestionably contains within its original limits more valuable silver mines than have been found in that portion of the great basin referred to or ever will be found there. I used to think very bigly of "the great east," and do so still, for it has many excellent mines, discovered and undiscovered; but I am dealing with facts that have been forced upon me, and why should I refrain from expressing a candid opinion, merely because its utterance will offend some man, whose pocket, as a Nevada miner, will be touched if Arizona becomes, as it certainly will become in the near future, the great center of attraction to mining capitalists. One disadvantage this district suffers from now is the immense variety of its ores and the queer looking stuff that at times carries a high percentage of silver. The richer the ore the more singular it looks. For a month at the first, a Nevada prospector, no matter how much experience he may have had there, is incapable of prospecting to advantage here. The kinds of quartz he selects are often barren and those he casts aside as worthless are rich.

So when experts arrive, they are really not fully qualified to judge of ores by sight and must depend, in a great measure, on assays, and if they themselves select the ore to be tested, they are likely to get very poor returns.

Good Developments.

The Metamora mine, a San Francisco incorporation, is being steadily opened, with very promising results. The vein is well defined and is likely to supply abundance of good ore, once it is opened below the water line. A new strike has been made in the Sherman, which is likely to add considerably to the value of that property. I am informed that McMillan, the locator of the Stonewall Jackson, has found a fine streak of chloride and native silver in the Hannibal lode, which he still owns, but I have not seen it.

The Weather

Has been quite cold of late for this Territory, the thermometer touching 19° this morning. There has been one fall of snow, with from two to 10 inches on the ground, according to altitude; but, except in shaded spots, it melted off in a day.

J. D. E.

Globe City, Arizona, Jan. 3d, 1878.

Heath District, Idaho.

EDITORS PRESS:—Reading an article in the PRESS of Dec. 29th upon the "Smelting Ores" reminds me that some account of Heath district in this county (Ada county) would be interesting to your readers. Heath district is situated on the head waters of the Weiser and other streams that put into the Snake river and is distant from Boise City about 80 to 100 miles.

This range of country is seamed with immense ledges of base metal ores. The most prominent is a ledge of galena over 60 feet in thickness and contains galena that runs from 70% to 80% pure. There is some silver in all these ledges and when reduced to bullion is worth from 75 cents to \$1.25 per pound. I have seen it reduced in a blacksmith's forge and run into bullets. There are large numbers of these ledges, some of which are located, but the parties claiming them are farmers living in the adjacent valleys and do not think there is any means within their reach of bringing them into available condition. There is an immense ledge of copper ore which is very rich and some effort will be made the coming season to develop it.

Here is surely a fine field for prospectors for base metal ores, and being located amidst the finest forest of timber with plenty of water and fine agricultural lands close at hand would be a very cheap locality for working such ores. At present want of railroad facilities are a great drawback to the working of such ores, but within a short time the Portland, Dalles and Salt Lake road will be constructed, which will pass along the very base of this entire range of mountains and through these fine valleys, and will enable capitalists to open these mines as cheaply as any in the country. At present the cost of freight from the railroad is from 2½ to 3½ cents to Boise City and from here to those mines would be from one to two cents more. Thus you see shipping base metals at present is rather expensive. But the immense natural resources of this interior country will soon bring railroad facilities.

A. B. ROBERTS.

Boise City, Idaho, Jan. 7th.

The Bonanza.

A Year's Work in the California Mine.

The annual meeting of the California mining company was held on Wednesday, the 16th inst. The following financial statement shows the condition of the affairs of the mine:

When the customary resolution, complimenting the Board of Trustees and endorsing their acts for the year, was proposed, Mr. S. P.

Dewey objected and there was some discussion, but the resolution was finally passed. The following is the

President's Report.

To the stockholders of the California mining company: The mine has yielded during the year ending December 31st, 1877, 217,432 tons of ore. Of this ore, 213,683 tons 150 pounds have been reduced, yielding bullion of the value \$18,924,850.27. The value of the gold in the bullion was \$9,386,745.47, and of the silver, \$9,538,104.80.

This is a splendid showing for the year and the dividends paid to the stockholders since the annual statement, amounting to the sum of \$14,040,000, are the tangible proofs of it.

The tax on bullion, levied by the State of Nevada, is onerous. We have paid taxes during the year amounting to the sum of \$462,629.78.

The discount on sales of silver bullion is another material item of expense, amounting for the past year to \$1,039,947.18.

The annual report of the Superintendent is very full and complete, giving detailed statements of the workings on the different levels of the mine; accompanied by full and accurate maps, showing at a glance the progress made in developing the mine; and I deem it proper to express, in this public manner, the thanks of the company to its Superintendent, James G. Fair, Esq., for the very able and intelligent manner in which he has discharged his duties.

And I feel I should not close this report without congratulating the stockholders upon the very prosperous year just closed.

GEO. WALLACE, President.

Secretary's Report.

President California Mining Company:—Here with I submit my annual report of receipts and disbursements for the fiscal year ending January 16th, 1878. Accompanying my report will be found a statement compiled by Mr. Taylor, chief clerk at Virginia City, showing the cost of every article used at the mine, and an estimate of what each ton of ore costs up to the time the bullion is shipped to San Francisco. In order to find what it costs to reduce each ton to money, I have made the following calculation of expenses incurred in San Francisco:

Discount on bullion.....	\$1,039,947 18
Refining.....	207,355 38
Bullion freight.....	70,315 26
Interest and exchange.....	78,811 94
Taxes.....	991 55
San Francisco office expenses, including stationery, salaries, etc.....	16,323 98
Total.....	\$1,413,745 50

This amount divided by the number of tons worked (213,683), gives a cost of \$6.61 6-10; cost per ton in Virginia, \$19.08 8-10; total cost per ton, \$25.70 4-10.

C. P. GORDON, Secretary.

We take the following from the very elaborate

Superintendent's Report.

Geo. Wallace, Esq., President of California Mining Company—Dear Sir:—The California mining company has yielded, during the year ending December 31st, 1877, 217,432 tons of ore. There remained on hand on the 1st day of January, 1877, in the ore houses and at mills, 1,260 tons and 300 pounds, making a total of 218,692 tons and 300 pounds. Of this ore, 213,683 tons and 150 pounds have been reduced, leaving on hand in the ore houses and at mills, 5,009 tons and 150 pounds, valued by assay at \$518,431. The ore reduced has yielded bullion of the value of \$18,924,850.27, or \$88.49½ per ton—this yield being 73 3-10% of the assay value of the ore. The value of the gold in this bullion was \$9,386,745.47, and of the silver, \$9,538,104.80.

After paying the expense of transportation and the heavy discount which is exacted on silver, the net proceeds realized from the bullion by the time it has become converted into money, amount to considerably less than the stamped value of the bars.

In reviewing the operations in this mine for the past year, that there may be a full understanding of their nature and extent, I will describe what work has been done on each particular level and the results.

1400-Foot Level.

Considerable work has been done on the 1400-foot level and on the levels above it, but not enough to determine whether ore exists or not in either of them. The drifts and crosscuts heretofore run are badly crushed and require much labor to place them in order. This should be done and the ore vein thoroughly crosscutted, and the value of the ore which may be contained therein be determined within the present year.

1500-Foot Level.

From the 1500-foot level much ore has been taken and much still remains on the east side of the stope which have been worked. Its quality, so far as it has been developed, is of low grade, excepting a small body lying south from crosscut No. 4 and on the west of the main ore body. This body is but 14 feet in width and between 60 and 70 feet in length.

In the northern 200 feet of the mine, on this level and the level above, our drifts and crosscuts have not been extended to the east boundary of the ore body, but have terminated in a vast body of poor quartz, of too low a grade to justify extraction.

We are now engaged in running a drift from the C. & C. joint drift on this level, so far, 136 feet, and its whole length, when it intersects the ore stope, will be 371 feet. From this drift we can develop this body of quartz cheaply

and avoid the crushing ground which adjoins the settling ore stope.

The main north drift, which extends from the main shaft to crosscut No. 4 on this level, also crosscuts Nos. 1, 2, 3 and 4, are in fair condition, but they are kept so at continual heavy expense on account of the constant settling and creeping to the east of the ground near to and west of the ore stope, through which the drift and these crosscuts pass.

1550-Foot Level.

From this level a vast quantity of ore has been taken, of high grade. On the sill floor the ore has extended the whole length of the mine, excepting a few feet next to the northern boundary. The same may be said of the second floor and upward, excepting 10 feet next to the north line. The part excepted carries ore of low grade. The ore body on this level, at the widest point, is 162 feet in width. To the east of this ore body there is a very large body of low-grade quartz, similar to that on the levels above, which has not been developed, the crosscuts not having been extended to the east wall of the ore vein. From all appearances the largest portion of the bulk of ore on this level has been taken out. There still remains considerable ore of good quality and a large quantity of medium grade.

We are now running a large working drift on the west side of the ore body in the solid west wall. This drift will extend the whole length of the mine, connecting with the main shaft on the south and with the Ophir mine on the north. All the crosscuts will be continued to this drift, and from it access will be had to all parts of the level.

This level is well ventilated by winzes sunk at intervals in the vein, connecting with the level above and with the level below.

The east clay of the ore body has been followed northeast from No. 3 winze 120 feet. Lying against this east clay is an east seam of ore, 18 feet in width, of fair quality. This ore seam gradually widens going north. It is east of what has heretofore been supposed to be the east clay of the ore body.

1600-Foot Level.

From this level 105,723 tons of ore have been extracted, and all of this has been hoisted through the Ophir shaft. The ore breasts show a large quantity of good ore remaining. The sill floor has been extended from the northern boundary south to within 240 feet of the south line of the mine. This 240 feet of the ore body is untouched between this level and the level above, except where it has been penetrated by No. 3 winze, which passes through it. This winze shows good ore.

The sill floor between winzes Nos. 5 and 6 discloses a poor spot extending across the vein. Its length is 50 feet on the east side and nearly 40 feet on the west side; but the second floor and all the floors above show continuous ore over this poor section. Winze No. 5 has been sunk 240 feet below this level and connected with the 1650, 1700, 1750 and 1840-foot levels. These winzes are large and have each two compartments, with strong air-winding engines placed upon them, and they are indispensably necessary for the transmission of men and materials and for the free passage of air from level to level.

A large drift connects with the Ophir shaft through which the ore is run out to that shaft and from which we obtain our main supply of pure air. A joint incline winze has been sunk from this level to the 1840-foot level. In its descent it connects with the 1700-foot level and ventilates that level. It is heavily timbered and is designed for a chute for the ore of the 1700-foot level. A large lateral drift is being run the whole length of the mine.

The east wall has not been reached in any of our crosscuts in the northern 400 feet of the mine on this level. These crosscuts all terminated in a large solid body of poor quartz.

1650-Foot Level.

The main drift which leads from the Consolidated Virginia and California joint shaft on this level has been carried forward to the ore vein.

A joint crosscut (No. 1) has been extended west across the vein to the Consolidated Virginia main shaft—a distance of 270 feet, and ore is now being hoisted through this shaft from this level.

This level has been partially opened by a main drift which runs in the middle of the vein for the whole length of the mine—except 40 feet in which the drift is now being advanced. This drift, as it passes north, connects with winzes Nos. 3, 4, 4½, 5 and 6. Crosscuts Nos. 2, 3, 4, 4½ and 5 have been extended across the ore vein; each one touching, as we suppose, the east clay and the west clay. Some of these crosscuts pass through fine ore, and some through worthless matter.

The sill floor of the stope opened on the south line extends north 105 feet, passing on each side of the horse. The ore again unites at No. 3 winze, the horse giving out at this point. Here we have opened a small sill floor 30 by 30 feet and 12 feet in height, and the ore here is of excellent quality. The ore body again splits in going north, one part of it hearing to the northeast and the other part to the northwest, under the ore body worked on the level above.

The main north drift in the ore body has already required to be enlarged and timbered five times, and is now in bad condition. To save the great expense of thus maintaining drifts in the ore vein, a lateral drift has been started from the main shaft and will be run north in

Continued on page 58.

MECHANICAL PROGRESS.

French Rewards for Inventors.

The French Society d'Encouragement offers, as is its annual custom, a number of prizes in the domain of the industrial arts. In the list of desiderata we note the following: Small motor for domestic workshop; improvement in manufacture of flax and hemp; deadening of shocks caused by block hammers; heckling short textile fibers; instruments of automatic topography (3,000f.); file-cutting machine; improvement of steam engine; new alloy useful in the arts; artificial manufacture of graphite for crayons, manufacture of black diamonds, industrial use of oxygenated water; theory of steel, based on precise experiments (6,000f.); rendering tissues and wood unflammable; sulphuric acid without arsenic, extracted from pyrites; chemical transformation, giving a useful natural product (4,000f.); cast steel or iron improved by alloy with another metal (3,000f.); economical preparation and use of ozone; fixation of nitrogen of the air in nitrates, cyanides or ammoniacal salts; artificial production of fatty bodies (4,000f.); disinfection of gas-purifying cases; permanent disinfection of water closets (2,000f.); rapid dessication of wood; means of preventing the adherence of soot in chimneys; food preservation; application of spectrum analysis in industry; small apparatus giving high temperatures; application of the endosmos of liquids and of gases; destruction of center of attack of phylloxera; utilization of land by fruit trees; distribution of pulverulent manures; employment of photography for typography. The awards are to be made at sundry dates between now and 1882.

PNEUMATIC TRANSMISSION IN GERMANY.—We have alluded to this subject before and reports now are that its success is great. The pneumatic post system, or "blow post" is in operation at Berlin and is being considerably extended. The system when complete will comprise 26 kilometers of tubing and 15 stations. The tubes will be of wrought iron, having a bore of 65 millimeters, and they will lie about one meter below the surface of the ground. The exhausting machines and apparatus required for working the Berlin system are situated at four of the 15 stations. Both compressed and rarified air, or a combination of the two are employed in propelling the "carriers," or boxes, into which the telegrams or letters are placed, and steam engines of about 12-horse power are used in condensing and rarifying the air. Each of the four main stations has two engines, which drive a compressing and an exhausting apparatus, and large containers, or reservoirs, are used for the condensed or rarified air. The tension of the condensed air is about three atmospheres, and that of the rarified about 35 millimeters of mercury; and the former heated to 45° C. by the act of compression, is cooled in the reservoirs which are surrounded with water. The letters and cards which have to be forwarded are of a prescribed size, 20 being the complement assigned to each "carrier." From 10 to 15 carriers are packed and forwarded at a time—a sort of pneumatic "train," in fact; and behind the last vehicle is placed a box with a leather ruffe, in order to secure the best closure of the tube. A train is dispatched every quarter of an hour, each of the two circuits or routes into which the system is divided being traversed in 20 minutes, including stoppages. A "blow post" letter appears to cost 3d. in Berlin, or about one-fourth of the cost of a telegram; and the average time of delivery in any quarter of the city is stated to be one hour.

LOSS FROM HEATED BEARINGS.—In a paper read before the Manchester Mechanical Society Mr. W. H. Bailey, on "Lubricants," he gives an idea of the waste from heated bearings. He said that when friction was produced heat was lost, and all energy thus wasted passed away in that heat which might be measured and valued with nearly as much facility as any article of commerce. From this knowledge they might gather, when they applied it to workshop economy, that if a pedestal or bearing became so hot through friction as to cause one pound of water to be raised 1° Fah. in temperature in one minute, heat had been lost equal to that which would be caused by a weight of one pound falling through a space of 772 feet, or heat had been lost which would lift one pound weight 772 feet; if they applied those illustrations still further, and imagined 41 pedestals or bearings losing heat by friction in a similar manner, they might inform themselves that they were losing one-horse power, and if they knew from their books what their coal cost it would take very little trouble to give them the exact cash value of the friction and destructive action. The maximum of pressure that solid lubricants would bear without destruction was unknown. For steel surfaces, lubricated with best sperm oil moving slowly, 1,200 pounds pressure per square inch of bearing surface has been found permissible. Under the pivots of swinging bridges several thousand pounds per square inch had been found to work, for iron journals 800 pounds per square inch should not be exceeded. He said that the oil which allowed the greatest heat to accumulate with the fewest revolutions, must be a bad lubricant.

WROUGHT AND CAST-IRON BRAKE SHOES.—A correspondent of the *National Car Builder* records the following experiment: Wishing to test the durability of wrought-iron as compared with cast-iron, when used as a brake-shoe, I had a wrought-iron shoe made of the usual form, and applied it to the brake-head of a brake beam in a four-wheel truck of a baggage car, and at the same time used a cast-iron one at the other end of the beam, putting them into service October 25th, 1876. The weight upon each wheel when the car was empty was 4,720 pounds, and when in service the average was about 5,800 pounds—the power used being the Westinghouse air-brake arrangement. The weight of the wrought-iron shoe when now was 14 pounds, and that of the cast-iron one at the other end of the beam 18 pounds. The car was then run between Louisville and Indianapolis until December 15th, 1877, making a total of 82,000 miles, at an average speed of 26 miles an hour, including stops. The wrought-iron shoe, when taken out, weighed eight pounds, having lost by wear six pounds in making the aforesaid mileage. In the meantime five different cast-iron shoes were put in and worn out, excepting the last one. The total weight of these when put in was 90 pounds, and the total weight when taken out was 46 pounds, showing a loss of 44 pounds by wear, or a little more than seven times as much as in the case of the wrought-iron shoe.

A STEAM SLED.—Mr. Cartmel, the English arctic explorer, from his experiences during the expedition of Capt. Nares, came to the conclusion that sledging by manual power was a hopeless method of attempting to reach the north pole, and since his return has been busily engaged in devising a steam sledge for that purpose. This contrivance, as described by the inventor, consists in its general outlines of a flat-bottomed boat with two stern wheels, the midship cross sections being a parallelogram. It would be constructed of steel plates lined with wood, perfectly rigid, and capable of standing the roughest usage. The boat-sledge, as it may be termed, would be highly polished, so as to minimize friction, whilst the how would be stayed and strengthened to the fullest extent, so as to resist concussions. Of course the steam power is intended to be concentrated as much as possible, whilst the steering wheels could be driven directly from the crank shaft.

DAMASCUS BLADES.—There have been some curious features connected with the sword manufacture in early times, says an Eastern traveler. The Damascus blades and the Toledo blades have, each in its own particular sphere, acquired great fame for their excellence; the keenness of the edge and the extensive and perfect elasticity having been carried in them to the utmost point. We have all read of Orientals wearing their swords twisted round their waists, or even coiled up in their turbans, so great was their elasticity; and swords have been made so keen as to cut a silk shawl in two while resting lightly on the edge. Such, at least, have been the reported wonders; but the Easterns may probably in this, as in many other matters, embellish their stories a little.

OIL PIPES IN RUSSIA.—The Russian capitalists who are working the petroleum wells are now laying down iron pipes from the wells to the Black sea coast, where ships will be loaded by pneumatic pumps. It was recently reported that an American company had petitioned the government for a concession to work all the petroleum wells in Asiatic Russia. It was pointed out to the authorities, however, that the Americans are aware that the Russian petroleum will enter into serious competition with American, and that this was an effort to paralyze the trade.

ELECTRIC LAMP LIGHTING.—The *Iron Age* says that the days of the lamplighter are numbered, and the time is at hand when he will exist only in story. Electricity is certain to take his place, because it can work more cheaply. It has been tried for the purpose of lighting and extinguishing 220 street lamps in Providence, R. I., scattered over a district nine miles long. One man attends to the whole business, and does it in 15 seconds. The method has now been on trial for some months, and a saving of \$10 per lamp per year is reported.

DUTY OF SCIENTIFIC MEN.—Prof. Pettenkofer, at the recent meeting of the German Association of Naturalists at Munich, thus spoke of the duty of scientific investigators: "Natural science has but to look for facts and truths, and need never busy itself about the immediate practical application of what has been found, because for them alone it deserves the sympathy of the entire civilized world and the means necessary for its culture and development."

STEEL COMPRESSED BY STEAM.—A gentleman who has just returned from a tour among the Pennsylvania rolling mills, tells the *Iron Age* of witnessing a very interesting process by which steam pressure is applied to Bessemer steel while in the molds, and thus far with excellent results, considerably reducing the bulk and improving the texture.

LEMON WOOD.—A traveler writes: "When in Rome, a few years ago, I was shown some work made out of wood of the lemon tree that was considered almost as good as if made from box."

SCIENTIFIC PROGRESS.

Change of Habits in Toads.

While prosecuting the field work as Paleontologist of the United States Geological Survey of the Territories, under the direction of Prof. F. V. Hayden, in Colorado, during last season, Dr. C. A. White had the opportunity to make some very interesting observations in relation to a change of habits in the common toad (*Bufo Americanus*). The district referred to is that portion of the great plains which lies immediately adjacent to the eastern base of the Rocky mountains, and which is traversed by the South Platte river and its tributaries there. The valleys of these streams are broad and shallow, and the streams, heading in the immediately adjacent mountains, have an abundant flow of water; so that large tracts of land in all those valleys have been brought under cultivation by irrigation. Irrigation is necessary in all that region, for it lies within that portion of the United States domain upon which the annual rainfall is insufficient for the purposes of agriculture.

With the irrigation of the land, came increased and perennial vegetation; with that came increased insect-life, and with that an increase of birds and toads. The irrigating ditches are everywhere numerous, and during the season of growing crops they are frequently visited by men to regulate the flow of water to the land. This, and other circumstances, disturbs the toads, that frequent the shade of the herbage which grows upon the borders of the water. It is no uncommon thing for toads, as well as frogs, to jump into the water when disturbed, but the habit of the former is to make a shallow dive, rise immediately to the surface and swim upon it by a sweeping curve to the shore again, not resting until the brink is gained, upon which they tarry awhile before coming upon the land. Frogs, on the contrary, when disturbed, make a strong dive directly for the bottom, upon which they lie prone, with the legs flexed against the body, and into the mud of which they settle themselves a little. Here they remain, and exhaust the patience of one who may attempt to wait for them to rise. Now the toads in this irrigated region have adopted precisely these common habits of the frogs, when disturbed upon the borders of the ditches, as Dr. White repeatedly witnessed. This is regarded as the resumption of an instinctive trait that has been potentially transmitted from a former race of anouans that were less differentiated than frogs and toads are now from each other; and that the lately introduced change of physical conditions in that region has caused the toads there to resume habits which the frogs have never abandoned.

Chance for Midnight Battles.

"The troops retreated under cover of the darkness" is a sentence which bids fair to go out of use in the history of future battles. The electric light promises to make fighting at night as practical as fighting by day—as though there could not enough bloodshed be enacted while the sun is above the horizon. A number of interesting experiments have been recently carried out at Metz by a committee of engineers and other officers appointed to investigate the practicability of employing electric light during siege operations, and to suggest any modifications which it may seem expedient to introduce in the apparatus at present in use. According to the *Pall Mall Gazette*, on the night of October 20th, Forts Frederick, Charles and Alvensleben were illuminated by throwing the electric light upon them, when it was found that at a distance of from two to three kilometers, not only buildings but also individual men could be plainly made out. On the night of the 27th of October the electric apparatus was arranged on the exercising ground outside the Chamber gate, and the light directed upon a row of targets. Fire was then opened against these latter by a squad of riflemen, and the practice made was nearly as good as that recorded on ordinary occasions when firing by day—a result which was considered exceedingly satisfactory, as a thick mist prevailed at the time, and materially interfered with the action of the light. Altogether the committee concluded that the electric light may in future be employed with advantage not only in siege operations, but also during outpost duty and engagements at night.

The London *Times* says that the parachute light, introduced into the service as a means of revealing the enemy's position and movements at night, is to be superseded by the newest description of star shell. The parachute light, which was invented by Colonel, now General Boxer, when superintendent of the Royal Laboratory Department, Royal Arsenal, Woolwich, is somewhat expensive in manufacture and rather cumbersome in carriage, as it forms, when closed, a large shell, expanding into a huge umbrella, 15 feet high, when opened, the cup of composition which is suspended being designed to burn four minutes and a half. The star shell is much smaller and more portable, and of comparatively trifling cost. It can be fired into the air from a mortar at the required angle to show the enemy's works, and burns with a brilliant light for about half a minute, long enough to take an observation and lay a gun, but not long enough to allow an adverse wind to bring the light back over the firing point, and so turn the advantage in favor of the enemy.

A Monstrous Geologic Reptile.

Prof. O. C. Marsh, in the last number of the *American Journal of Science* states that the museum of Yale college has recently received the greater portion of the skeleton of a huge reptile, which proves to be one of the most remarkable animals yet discovered. It was found on the eastern flank of the Rocky mountains, in beds which are regarded as corresponding nearly to the Wealden of Europe, and which may be classed as upper Jurassic. The remains are well preserved, but are embedded in so hard a matrix that considerable time and labor will be required to prepare them for a full description. The characters already determined point to affinities with the Dinosaurs, Plesiosaurs, and more remotely with the Chelonians, and indicate a new order, which may be termed *Stegosauria*, from the typical genus here described.

In this specimen, some of the teeth preserved have compressed crowns, and are inserted in sockets. Others are cylindrical, and were placed in rows, either in thin plates of imperfect bone or in cartilage. The latter are especially numerous, and may possibly prove to be dermal spines, having all the essential characters of teeth, as in some fishes. The vertebrae are biconcave, their neural arches being cooified with the centra, and the chevrons articulated. The limb bones indicate an aquatic life. The body was long, and protected by large bony dermal plates, somewhat like those of *Atlantochelys* (*Prostostega*). These plates appear to have been in part supported by the elongated neural spines of the vertebrae. One of the large dermal plates was over three feet (one meter) in length.

The present species was probably 30 feet long, and moved mainly by swimming. For its discovery science is indebted to Prof. A. Lakes and Engineer H. C. Beckwith, of the United States navy, who found the first remains in Colorado near the locality of the gigantic *Atlantochelys montanus*, and in essentially the same horizon.

A PARASITIC CATERPILLAR.—We read that Mr. J. C. Bowring has discovered a curious moth, which in the caterpillar state is parasitic on the Chinese lantern fly (*Fulgora candlearia*). The caterpillars are very short and thick, fleshy and about half an inch in length, and, when fully fed, covered with a "cottony coat," which makes them resemble certain bark lice. The pupa is covered by a thick cocoon, and the time in which it remains in the pupa state is very variable; in one instance only nine days, in another "during our cool season"—upward of 12 months. The caterpillars are themselves infested by hymenopterous parasites. Prof. Westwood, who describes the insect in the "Transactions of the Entomological Society of London," under the name of *Epiphyrops anomala*, thinks that the caterpillar feeds upon the waxy secretion of the fulgora. The moth is referred to the arctians by Prof. Westwood; but while it is probably one of the bombycidae, we think it is wrongly referred to the "arctiids."

SCORPIONS AS STRIDULATORS.—While many of the higher insects, as grasshoppers, katydids, crickets, cicadas, and even moths, produce a creaking or stridulating noise by rubbing one part of the body on another, it has hitherto been unsuspected that scorpions have the same faculty. Mr. J. Mason Wood, however, has recently announced the discovery of stridulating organs in the scorpion. After noticing this while dissecting a specimen, he was able to confirm it by experiments on living examples. By placing two large scorpions face to face on a light metal table, and exciting them, they began to heat the air with their palps and simultaneously to emit sounds which were most distinctly audible, not only to himself, but also to the bystanders, above the clatter made by the animals in their efforts to get free, and which resembled the noise produced by continuously scraping a piece of silk woven fabric.

BALLOONS AND SCIENCE.—In conversation with a St. Louis newspaper reporter a few days ago, Prof. Wise, the aeronaut, expressed his views of the possibilities of ballooning, as follows: "Balloons may be made of boiler iron if built large enough. You know it is the hattle of cubes and surfaces. When the surface is doubled the cube is quadrupled, and a balloon of 400 feet diameter of copper boiler plate will lift up a man-of-war ship and sail away with it. With such a balloon stocked with bombs and other munitions of war, think what consternation could be carried into a besieged camp. But the mission of the balloon will be more for scientific explorations. That overshadowing science called meteorology will yet provide its definition in the use of the balloon."

BISMUTH.—No country is so rich in bismuth ores as Bolivia. The mines which yield the largest amounts are those of Tazna, Chorolque, Oruro, and some others in the neighborhood of Guaina-Potosi, Sorata, etc. The bismuth is usually accompanied by tin, frequently by gold and silver. The presence of bismuth has been discovered in several localities of Peru and Chile, but in quantities comparatively very limited.

A NEW THEORY OF THE NATURE OF WATER.—M. Maiche in *Les Mondes* propounds the theory reached after numerous experiments that water is simply hydrogen plus electricity, or oxygen minus electricity; or, in other words, that normal electrified hydrogen constitutes water, and that normal diselectrified oxygen produces the same.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

AMADOR.

A GOOD FIND.—Amador Ledger, Jan. 19: One day last week Marion McCarthy, of Big Oak Flat, while prospecting on the Oak Flat side of the Deer Flat divide, had the good fortune to find \$500 in gold dust. The precious metal was in a "heap," which leads to the supposition when placed there it was in a sack, which had rotted and disappeared by the action of the elements. Let that be as it may, it got there, young McCarthy found it and will have the benefit that amount of gold may do in these hard times.

The first pay-day of the Lincoln company since the resumption of work came last week, to the joy of all hands. The men received their money in checks—a very handy mode of paying.

The first clean-up of the Lincoln mill was made last week. The yield of bullion, we understand, is considered satisfactory.

OPERATIONS at the Moore mine were suspended Tuesday and Wednesday on account of inclement weather.

The flume of the American Flat gravel company, at Fiddletown, was completed last week. It is the best piece of work of the kind in the county. As the heavy rains of the past week have probably started ditches, hydraulic operations will be started immediately.

PLYMOUTH.—We learn that a San Francisco company have purchased the Baldwin mine, near the Central, and will immediately place a gang of men at work to develop it. Quartz mining with us has taken a new start, and every indication favors the opening of several mines in this section this season.

The north shaft of the Phenix is down 1,200 feet. Good ore, showing free gold, has been struck at that depth, which is the first time, we are informed by Engineer Easton, that ore has been struck in sinking that shaft. They are now drifting in the north shaft and sinking the sump.

BUTTE.

BIG BAR.—Oroville Mercury, Jan. 18: The rain has furnished the Big Bar mining company with all the water that it wants for mining purposes. Two chiefs are at work with a full crew of men. Everything is fitted up in the best possible order for working. This company claim that the mine is one of the richest in the State, and they will now have an opportunity to demonstrate it.

LAVA BEDS.—The Lava Beds below town are yielding about \$30,000 each month, though some months the yield reaches the snug little sum of \$100,000. These mines are worked chiefly by Chinamen. There are 10 or 12 steam engines at work in different parts of the Lava Beds pumping out water. About 1,500 men are at work. With the aid of the steam pumps they can get down further, and they find the gravel all the richer.

ANOTHER SHAFT.—Captain Ferguson, of San Francisco, has a crew of men at work on the bluff near the shaft of the Oroville gravel mining company, and are hard at work going down into the earth in hopes to reach the bedrock. They have put some excellent machinery on the claim for pumping water and raising the earth. This shaft, together with that of the Oroville company, will thoroughly prospect the bluff.

CALAVERAS.

PLENTY OF WATER.—Calaveras Chronicle, Jan. 19: For the first time this season the ditch carrying a full head of water, and miners all along the line have been prompt in making use of it. Operations are now being vigorously pressed in all the claims in this vicinity, and the winter's mining campaign may be said to be fairly opened. Within a radius of two miles of Mokelumne Hill there are no less than seven great gravel mines, all of which are now being actively worked. Querel & Co., Duryea, Brown, Veith, Moser & Co., Emerson and Cook & Co., are proprietors of the properties, and there is not a more energetic septette of miners in the State. With the resumption of mining operations we can confidently count upon the departure of "hard times."

NEW MINING ENTERPRISES.—Several new mining enterprises have been instituted in this vicinity lately. Sliter & Co. are opening an extensive gravel claim in Old Woman's gulch, with good prospects of success. They have a large force of hands at work. Kelly & Co. are actively engaged opening a new mine near Sport Hill, and several other companies are prospecting different localities. This is going to be a lively season in a mining point of view.

UPPER COUNTRY JOBS.—At West Point the Champion still is sinking, development continuing of the most satisfactory character. Halsey & Witford are to take 200 tons of ore from the San Francisco mine. The new mill being erected at the Granite mine is nearly completed. The Enterprise Con. mill will be started up immediately. There is upwards of 200 tons of rich ore on the dumps. Everything is progressing favorably at Mosquito. Work is being pushed on all the mines with fully as good results as at any previous period in the history of the district. The San Bruno hoisting works will be in operation in a few days.

INYO.

CERRO GORDO.—Inyo Independent, Jan. 19: The Beaudry furnace of the Union Con. com-

pany is making a steady output of 125 hars per day of probably the richest hase bullion now produced on the coast, mainly from high grade silver ore coming from the San Felipe. The lead mines yield only sufficient ore to furnish the necessary flux and keep the one furnace in operation. In the new shaft drifting is in progress both from the 700 and 900-ft levels, to strike or run under known bodies of ore in the Union and Santa Maria. Everything about the works is running admirably.

BULLION SHIPMENTS.—Coso Mining News, Jan. 19: The Sheldon, on last Sunday, shipped its first bullion, being a bar weighing 76 pounds. We did not learn its value, but it is reported to be about one-half gold, which would make quite a respectable shipment for a five-stamp mill, just starting up and running but a short time. The Emigrant company, on the same day, made its usual shipment of 87 pounds, valued at \$1,650, and on yesterday shipped 80 pounds more, valued at \$1,500; total for the week, \$3,150. As there are 80 tons of first-class ore on the dump, the mill running all right and plenty of good ore in sight in the mine, regular shipments may be expected for a long time to come.

NEVADA.

SWEETLAND.—Grass Valley Union, Jan. 20: Geo. D. McLean, of Sweetland, was in town yesterday. He reports the storm and rainfall a good thing for his section of country, to a certain extent, but there was not enough of it to keep the gravel mines going for the season. Most of the gravel companies have commenced work, but not all of them. More water is wanted, which is very likely to come, now that the storm-kind has got his hand in.

SPLendid rock continues to come from the Centennial mine. It is estimated at \$100 per load.

The Shamrock mine, near Forest Springs, has been milling good pay rock for some time.

The roads are not in good condition, but the quartz teams are kept busy hauling rock to the custom mills.

The heaviest rain of the season fell in Nevada county, yesterday. It came in with a bluster that meant business, being preceded and accompanied with a southwest wind, which gave things a general shaking up. Trees bent before the blast, casements rattled and buildings trembled to their foundations, but they were sounds of melody to many an anxious mine owner, who has stood idle all winter, by his claim waiting for water, which seemed as if it would never come. It was cheering to hear the congratulations exchanged on all sides, everyone appearing as happy as if they had struck a bonanza. It was a bright day in our weather calendar and a hopeful one for the mining industry of this county and doubtless of the whole mining region of the State.

STRUCK GRAVEL.—Nevada Weekly Gazette, Jan. 19: One of the river mines, below Smartsville, is down near 40 feet with its shaft and last Sunday morning struck hard gravel, with indications of being near bedrock. They are washing the gravel coming out of the shaft through sluices and taking out some gold. The prospects are that on the bedrock they will find good pay gravel.

The Rocky Bar mine is doing splendid. They have taken out about 150 loads, that will average over \$50 per load. They will soon have machinery erected on the mine, which will enable them to take out more rock.

The miners are happy now on account of the heavy rain that fell this week. They hope it will continue to rain for one month, so that they can start to work their placer mines. It will make money more plenty, then everything will brighten up and business will be more lively in this county.

PLACER.

RAIN.—Dutch Flat Forum, Jan. 17: It commenced raining here at midnight on Monday, and with slight interruption has continued up to our going to press. With the amount of water already fallen during the storm and the prospect we have of more, we hope, next week, to be able to report a number of our mines busy at work.

BLAST.—A blast of 500 kegs of powder was fired in the Baker mine, last Saturday, doing splendid execution. On Tuesday last, a three-ton blast of powder was fired in the Franklin claim, which also did good work.

The rain storm at the Flat was quite heavy and it is expected that a considerable number of miners will be ready to start up at once.

MICHIGAN BLUFF.—Cor. Placer Herald, Jan. 19: Col. Keown, of the Hazard mine, has got some good prospects lately and is now prosecuting his work vigorously. The Hidden Treasure and Weske mines are both paying well at present and each mine employs a great number of men, and there are but few other mines in this immediate neighborhood doing anything at present.

PLUMAS.

NORTH FORK ITEMS.—Cor. Plumas National: The Carriboo ditch broke last week; about 100 feet slid off. The upper bank broke off for several feet and our little friend, Geo. McGranahan, says he thinks the whole mountain would have slid off but for "scarcity of dump," although there is some 2,000 feet between it and the river. The boys who leased the Dutch Hill tunnel are doing well, making an average of \$6 per day to the hand. The Sunnyside boys are busy pegging away, with very fair prospects ahead. The new tunnel the company are running is progressing splendidly. It is in something over 500 feet at present. The Meager

Gravel company have their claim all fitted up and are now waiting for water.

SHASTA.

FURNACEVILLE ITEMS.—Cor. Redding Independent, Jan. 17: The Afterthought is thundering away, night and day, and with success beyond expectation. I was in the office a short time ago and saw a beautiful sight consisting of several silver bricks. The fact of the wealth of the district is, fully established, other works will be erected early in the spring. The sulphur fumes arising while working, became so offensive and unbearable to the men that flues had to be built to convey the nuisance off. Heretofore the company have had considerable trouble in the working, on account of the large amount of copper obtained; to obviate this a certain amount of limestone is put in the batteries with the ore, and the change in the appearance of the bullion is truly astonishing, the bricks looking almost like refined silver.

SIERRA.

GOOD ROCK.—Mountain Messenger, Jan. 19: Baker & Co. are still taking out good rock at the Ned Leonard mine, and will soon commence crushing at the Gold Bluff mill.

CUSTOM MILL.—What we want here is a custom quartz mill to test some of the thousand and one ledges that are to be found in this vicinity.

BONANZA.—The tunnel to open the Virginia and Bonanza mining claim, at Howland Flat, is now in about 800 feet, and is being pushed forward. The ground is known to be very rich, having been tested by the Empire, which has been one of the richest mines ever opened in that section.

BREAK-DOWN.—The eccentric shaft which carries the pump rods at the Pliocene mine broke on Saturday last, stopping the works. Superintendent Thurston left immediately for San Francisco. The shaft is of cast-steel and was made in the East.

Nevada.

WASHOE DISTRICT.

CON. VIRGINIA.—Gold Hill News, Jan. 23: Daily yield, 650 tons of ore. The mills are all kept steadily crushing and the yield of bullion for January is already largely in excess of the usual yield at this date in the month. An immense reserve of ore is being piled up at the mills and it would hardly be possible to find another as prosperous an outlook as the mine presents anywhere. The ore stopes and breasts on the 1200, 1300 and 1400-ft levels all show well and are yielding good ore at almost every point. The winzes and drifts opening up the southwest ore body on the 1500-ft level are all advancing as usual. There may be some who do not understand the order of the crosscuts on the several levels of this mine. For their benefit, we will state that on all the levels, crosscut No. 1 is the drift very nearly, if not quite always, on the dividing line between the California and Con. Virginia mines, and that the numbers counting from that increase going southward in the Con. Virginia, and likewise increase going northward in the California.

CALIFORNIA.—Daily yield, 750 tons of ore. The mine is looking splendidly in every part. The mills are all crushing to their fullest capacities and the yield of bullion for the month of January is already \$200,000 in excess of the usual yield at this time of the month. Reserves of ore are steadily accumulating at the mills, and the prospects of dividends for many months to come were never better than now. The ore stopes on the 1600, 1650 and 1700-ft levels are looking well and yielding rich ore.

YELLOW JACKET.—On the 2200-ft level the crossdrifts east and west from the main north drift are each in 80 feet and both are in porphyry and quartz. The main east drift at the same level towards the new shaft is still running in hard blasting rock. The new shaft is now down 1,170 feet.

SUTRO TUNNEL.—Face of header in somewhat softer vein matter, requiring close and careful timbering and lagging to guard against possible caves. Slight increase of water. Total length of tunnel, last evening, 18,762 feet.

OPHIR.—Sinking the main incline is going ahead prosperously, the rock in the bottom blasting out well and making an excellent shaft. The bottom is almost entirely dry. The south drift from the 1900-ft station is being steadily advanced, the face in blasting ground, with a considerable flow of hot water. This drift is very hot. The joint Mexican winze on the north line has reached the 1900-ft level, and a drift is being run at that point to meet and connect with the joint west drift from the north drift on the 1900-ft level. This connection will be completed in a very short time. The east drift on the 1800-ft level is steadily advancing in good blasting ground, toward where it is expected to cut the east ore vein found on the 1900-ft level. The air connection with the Sierra Nevada mine on the north is greatly benefiting the mine on all its levels.

LADY WASHINGTON.—On the 850-ft level the main south drift continues in low grade ore. It is all quartz of the finest character, assaying \$12 and more to the ton. This drift will connect with the drift being driven from the Justice mine to meet it inside of 10 days, when good, advantageous ventilation will be afforded. The Lady Washington company will then make a crosscut to the east through the ledge at the Justice line.

BELCHER.—Sinking the north incline shaft is making excellent progress. It is now down 150 feet below the 2100-ft level. The east drift from the 2100-ft station is steadily advancing

toward the ledge, the face in porphyry. An east drift from the bottom of the 1900-ft winze has been started and is now in 45 feet.

JULIA CON.—The new hoisting machinery for the incline below the 1800-ft level arrived at the mine yesterday, and is being placed in position as fast as the nature of the work will admit of. The foundations are all ready to receive it, so that to set it running will be a comparatively short job. Sinking the incline is making steady and favorable progress. Preparations are now about completed for starting a diamond drill in the face of east crosscut No. 1 on this level.

MEXICAN.—The joint Ophir winze has reached the 1900-ft level, at which point a drift is being driven eastward to connect with the west joint winze from the Ophir north drift. This connection is a very important one and will be completed in a very short time. The ventilation obtained by a connection with the Sierra Nevada mine, on the 1600-ft level, is beginning to exhibit its good results in every portion of the mine, the men being able to do almost double the usual amount of work.

ALTA.—Sinking the main shaft to cut and prospect the ore vein in a downward direction is being pushed ahead with all the energy possible. It is now down 73 feet below the 1150-ft level. The south drift on the 1150-ft level is steadily advancing, the ore in the face showing a steady improvement. This drift is also being advanced with all possible speed to reach a point below where the rich ore was found on the 1050-ft level.

GOULD & CURRY.—Retimbering the main shaft will be completed in a day or two more. Sinking the main incline is going steadily forward. An upraise has been commenced from the west drift on the 1900-ft level to drain the water and connect with the bottom of the incline in its downward course. A large new air-compressor, built after the same pattern as that now in use at the C. & C. shaft, is being put in.

UNION CON.—The winze connecting with the Sierra Nevada south drift, on the 1600-ft level, has been thoroughly timbered, and now furnishes splendid ventilation for the mine to that depth.

NEW YORK.—The material at the bottom of the shaft shows considerable improvement. It is hard quartz and porphyry, with streaks of ore which give good assays.

CON. IMPERIAL.—The north drift from the bottom of the winze on the 2400-ft level is being advanced at a very rapid rate.

SENATOR.—Men are employed fixing up the machinery of the hoisting works preparatory to resuming operations in the mine, and a tunnel is being run in the surface workings to better define the top of the ledge. The Sutor tunnel is less than 100 feet from the eastern line of the Senator, and when it has arrived at the proper point, lateral drifts will be run north and south from the tunnel, by the Senator company, arrangements having been made for that purpose. An upraise will also be made to connect with the old Senator workings.

OVERMAN.—The south drift on the 1400-ft level is making steady and favorable progress. A crosscut east has been started on the 1000-ft level, which is making good progress, the face in very favorable ground.

JUSTICE.—The Pacific mill was started up on ore from the mine day before yesterday. There is a good supply of ore already at the mill, and all the winzes and ore chutes in the mine are full to overflowing. It is the intention to soon start other mills on the ore.

UTAH.—The north drift on the 1300-ft level is steadily advancing, the face in much softer ground. The north drift on the 1150-ft level has reached the north line, and a west crosscut has been started at that point.

NORTH CON. VIRGINIA.—Sinking the shaft is making excellent progress, the rock in the bottom being quite hard.

BEST & BELCHER.—Work has been resumed in the face of the north drift on the 1900-ft level. As soon as the water is drained on this level, sinking the deep winze below the 1700-ft level will be resumed to connect with this drift.

CALEDONIA.—The north drift on the 1600-ft level is steadily advancing, the face in good working ground. The east crosscut on this level is developing some very fine quartz.

BULLION.—Sinking the main incline is going vigorously forward and is making fair progress, considering the extreme hardness of the rock penetrated.

SAVAGE.—The foundations are all in readiness and a portion of the new pump-boh is being lowered into position to-day. It will now be but a very few days before everything will be again in good working order.

SILVER HILL.—The new plunger pump at the 800-ft station is working finely. The east crosscut on the 800-ft level is steadily advancing, the face in very encouraging ground.

HALE & NORCROSS.—The water is now only 20 feet above the 2000-ft station and appears to be very weak, the pumps gaining on it easier than at any time for months past.

BALTIMORE AND AMERICAN FLAT.—The drifts and winzes from the 1050 down to the 1400-ft levels are now nearly all repaired and in good working order again.

CROWN POINT.—Daily yield, 60 tons of ore. Sinking the south winze below the 2000-ft level is making steady progress.

CHOLLAR POTOMI.—Sinking the Combination shaft is making the usual fair rate of headway. The old shaft is being retimbered.

LEVIATHAN.—Pushing the incline down toward the 700-ft level at a lively rate. The new hoisting arrangements work finely.

SUCCOR.—Good streaks of low-grade ore con-

tinue to be cut through in sinking the shaft.

TRONAN.—The ore stopes continue their good yield and promise, and about 50 tons per day of ore is being extracted, keeping the Vivian mill constantly running.

BRISTOL DISTRICT.

MAYFLOWER.—*Pioche Record*, Jan. 19: Most of the past week has been spent in straightening and repairing incline. The north and south drifts have been extended each about 12 feet, both having good ore. The ore struck in the north drift assays over \$200. Owing to stormy weather very little work has been done on the road.

CHICK EASTERN.—Owing to the stormy weather but very little work could be done in putting up whin. Expect to finish it and take out loose rock at bottom of shaft, after which work of drifting and taking out ore will commence.

DAY STATE.—The contractors have continued the incline some 10 feet. The whole incline is in good ore, about a foot and a half assaying \$200.

ELY DISTRICT.

PIOCHE BULLION.—*Pioche Record*, Jan. 14: \$18,293.04 in bullion was shipped during the past week, according to the reports of Superintendents.

SHIPPED.—The five-stamp mill at Bullionville has all been taken down and the last of it was shipped to Silver Reef on Tuesday. It will be rebuilt there.

RAYMOND & ELY.—Have had to suspend work on the winze below 11th level on account of water. The other portions of the mine are running about as usual. The 30-stamp mill was stopped five days last week for necessary repairs, but is now running on tailings.

ALPS COMPANY.—The stopes above the 11th drift, and in winze below 11th, are producing high-grade ore. The drift west from 12th station is being run with eight-hour shifts and is now in a distance of 75 feet. The works were closed down three days since last report on account of the freezing of the main water pipes. The mill is running regularly; company shipped \$8,800 fine bullion during past week.

EUREKA DISTRICT.

MINING ITEMS.—*Eureka Sentinel*, Jan. 19: There are 700 tons of first-class ore on the Hamburg dump at the mine. A small lot of ore from the Mortimer mine, worked at the Richmond furnace, yielded \$962. The population of Ruby hill, including both the Eureka and Richmond sides, will reach 1,500. General Connor has shipped a lot of Silver West ore to the Sacramento smelting works. The Ridge-way mine has been sold at Sheriff's sale, and brought \$70, not enough coin to pay the costs. The Eureka Consolidated furnaces are averaging 48 tons of crude bullion a day. Slag-pot explosions were quite frequent last night. The exciting cause was the prevailing damp weather.

The Eureka and Richmond furnaces consume 9,500 bushels of charcoal daily, the same costing \$2,375. The Prospect Mountain tunnel is in 550 feet, the face of it in hard, blue limestone. The crystallizers at the Richmond refinery will suspend operations to-day, but will start up again Monday morning. The cupels will continue at work as usual. The Sacramento smelting works draw largely on Eureka for material. Flue-dust, litharge and rich ores are daily forwarded by General Connor. The Richmond company have piled up, in front of their refinery, an acre of cord-wood and are adding to its proportion daily. About 40 miners, including chloriders, find constant employment at the English company's mine, Mineral hill. The repairs to the K K furnace have been completed and the works are in good order for another prolonged and profitable run. Furnaces Nos. 3 and 4, at the Eureka Consolidated works, are making a very long run, having been nearly five months in constant operation. It was expected that they would have to be relined a month ago, but they are still turning out their daily quota of bullion and are good for another month's campaign.

BULLION.—About \$115,000 worth of crude bullion was shipped last week.

JACKRABBIT DISTRICT.

DAY MINE.—*Pioche Record*, Jan. 19: The winze from south drift has connected with upper tunnel; five feet of good-looking spar, assaying \$38 per ton, and three feet of rich ore, making vein eight feet wide, with an opening at bottom, with a strong current of air. All the work done shows this to be a regular defined fissure vein. The ore in the open cut continues to develop in length and depth. In the lower tunnel have struck a very promising vein of black spar, assaying \$23 per ton; will drift both ways on the vein next week. Teams are now hauling to railroad at Ham Light station. There is now at the mills at Bullionville 350 tons of ore. The 20-stamp mill will start on this ore as soon as quicksilver arrives, which is expected daily.

TEM PAHUTE DISTRICT.

TO BE DEVELOPED.—*Eureka Sentinel*, Jan. 18: The recent organization of the Tem Pahute company, of Chicago, and the arrival of its representatives at this point, is an assurance that the known valuable locations in that district will be developed at an early date. The officers are wealthy men, and the working capital subscribed is sufficient to demonstrate the worth of their property. Col. J. H. Baker, a well-known resident of eastern Nevada, and the original owner of the series of locations that now belong to the Tem Pahute company, has been appointed Superintendent, and since his return

from his visit East, has, in conjunction with the gentlemen who accompanied him, been busy arranging for the forwarding of supplies, machinery and men. They experienced some difficulty in procuring teams to transport their freight, but cut the Gordian knot yesterday by buying outfits of their own, which were loaded and sent forward last evening. Ten miners were also employed, and the force will be added to as the work progresses. It is the intention of the company to build a mill next summer if developments warrant.

Arizona.

HUMBURG DISTRICT.—RICH STRIKE.—*Arizona Enterprise*, Jan. 16: Messrs. D. R. Poland and J. A. Robinson arrived here, yesterday, from Hamburg mining district. We have had a conversation with Mr. Poland and learned the following: A few days ago, a vein of ore, assaying a trifle less than \$20,000 to the ton, was struck in the south claim of the Tip-top company. In addition to the foregoing, McCaunon & Gillespie have struck a very rich vein of gray carbonate ore in one of their claims, the Jenie Greene. TOM BARNUM has all the rich ore he wants in the Basin ledge.

POLAND, Roberts, Billy Gavin and others have sunk six shafts to a depth of 15 feet each, upon six lodes, and they are now sinking, with might and main, upon the Willow and Treasure Trove lodes, which are yielding very rich silver ore.

BIGELOW & Co. and scores of others are piling up ton upon ton of very rich rock.

The Tip-top company have a force of 100 men employed in opening a road to the pine timber on Bradshaw mountain. Said road will be about eight miles long. It is their intention to erect and run a saw-mill.

People are every day arriving in the district, and the excitement is so great that even the oldest "boys" are more or less saturated with it.

The weather is fine in Humburg; no snow and scarcely any frost. Things are now simmering, but they will boil as soon as the Tip-top company's new 10-stamp mill shall have made a clean-up.

MOHAVE COUNTY MINES.—We feel safe in asserting that the new 20-stamp quartz mill of the McCrackin company is now at work, crushing in the neighborhood of 100 tons of ore every 24 hours. The Signal company's 10-stamp mill is reducing nearly 50 tons of ore every day. The mill at Mineral Park is pounding away. That at Hackberry will soon be running, so that our Mohave county friends may expect lively times; that, too, in a very short time. The county is one of the richest in metals and minerals in the Territory, and, being nearer the bases of supplies than the majority of her sisters, her immediate prospects for development are indeed good.

Colorado.

AMERICAN.—*Sunshine Courier*, Jan. 12: The ore body continues good in the drifts of the crosscut vein of the American, and large quantities of ore are being sent up. The 300-ft drifts are producing good ore, with considerable ruby silver intermixed.

G. B. STANLEY is sinking a 10-foot shaft on a new discovery, just north of town, for Harvey Denniston. The surface quartz pans nicely in free gold, and as it is on the belt it promises to make a good mine.

A. SHAEFFER and P. Bucher are at present working the Revenue lode, in Central gulch. The shaft is 27 feet deep, and by specimen assay the ore has run as high as \$540 per ton.

The Corning Tunnel Co. was nonsuited in its case against the Slide Co., in Denver, last week. We hope this will end the litigation, and that vigorous work may soon be done on this piece of property.

The Grand View mine was fully cleared of water last Saturday. A contract for sinking 30 feet was to be let towards the end of the week, and work will be pushed by three eight-hour shifts, the idea being to get down in the least possible time. The shaft was 230 feet deep when work was stopped for want of the facilities which the new engine now provides.

GOLDEN AGE.—Mr. Walker has been piling up the Golden Age ore until he has several hundred tons ahead. The new mill at Jamestown was started Monday night for the first time, and has been running steadily ever since, giving handsome results. There are now 35 hands employed at the mine, and it is expected the force will be increased to 60 men very soon. The shaft is looking splendid in the bottom, at a depth of 63 feet, where they are now taking out the finest ore the mine has ever produced.

Idaho.

SAN FRANCISCO.—*Idaho World*, Jan. 15: The Superintendent of the San Francisco company is pushing work ahead on the Atlanta ledge, in Alturas county. Over 200 feet of crosscuts have been run without succeeding in finding the pay vein, and work is being prosecuted on a drift west, following the ledge, with good indications that pay ore will soon be found. Mr. R. B. Brown, the Superintendent, is very persevering in his labors for the company, and we believe his energy will be rewarded by finding a good ledge yet.

WAGTOWN.—*Idaho Avalanche*, Jan. 10: The Jones mill at Wagtown has resumed operations after being idle for the past few weeks. A considerable quantity of rock has been forwarded from the Lepley mine for crushing. It is expected to make a handsome yield. Favorable reports have again been received relative to the resumption of work in the Empire. The

prospects now are that a fresh start will be made during the coming fortnight. Work is progressing as usual at the Illinois Central. It is announced that the Potosi will start up in a few days.

The Black Jack ledge still continues to wear an unusually promising look, and the work is being rapidly pushed forward.

Much anxiety is still felt relative to the completion of the ledge in the lower levels of the Golden Chariot. The work has not progressed sufficiently far yet to justify the formation of any decided opinion, but the indications are decidedly favorable.

Montana.

BULLION.—*Helena Independent*, Jan. 10: In a little less than one year, ending December 31st, there was melted and run into bars at the U. S. assay office, in this city, gold bullion of the value of \$390,911, and silver bullion valued at \$229,766—total, \$620,677. It is estimated that the gold and silver bullion produced in Deer Lodge county in the month of December last exceeds \$125,000, of which \$30,000 came from A. J. Davis' mill, at Butte. Verily the production of gold and silver in Montana is but in its infancy.

HOPE AND NORTHWESTERN.—*New Northwest*, Jan. 10: The mills of the Hope and Northwestern companies at Philipsburg are running regularly, and both mines are being worked with full crews of men. For the past five months the prospects of both companies have been continuously flattering.

A FINE body of ore was developed in the 260-ft level of the Speckled Trout mine, and now speculation is general as to what the developments are at the 310-ft level. Good ore having been sent up from the winze all the time, we have good reason to hope for favorable reports.

The Raymond & Ely Mine.

The annual meeting of the Raymond & Ely Mining Co. was held on Tuesday.

The President said that the most important work now in progress was a crosscut on the 1200-foot level into a new body of ore called the "black ledge." There was \$60,000 worth of supplies on hand, and the mine and mills were in good condition. The railroad was paying expenses. The schedule of the property shows an aggregate value of \$781,664.89.

The following is a condensed statement of the receipts and disbursements:

RECEIPTS.	
Cash on hand last annual report.....	\$2,293 50
From bullion.....	295,155 74
Ore sales.....	6,416 60
Sundry sources.....	51,621 23
Total.....	\$355,487 07
DISBURSEMENTS.	
Ore extraction.....	\$38,617 00
Dead work and prospecting.....	49,632 41
Supplies for mine.....	21,201 79
Wages.....	40,254 83
Supplies for mills.....	54,195 40
Ore purchases.....	25,683 40
Bullion discount.....	24,689 73
Cash on hand December 31st, 1877.....	15,940 36
Sundries.....	85,216 15
Total.....	\$455,487 07

The report of the Superintendent shows 2,596 tons of ore extracted, at an average cost of \$19.69 per ton; 2,372 tons were reduced at the mill, the average assay value being \$76.73 per ton, and bullion was produced amounting to \$154,416. Tailings amounting to 16,832 tons were reduced, the average value being \$26.37 per ton, and produced bullion amounting to \$135,932. There are now 19,000 tons of tailings on hand, estimated to be worth \$1,440,000, or \$18 per ton.

Academy of Sciences.

The regular meeting of the California Academy of Sciences was held on Monday evening last, Prof. Davidson in the chair. A paper was read by the President, from information derived from Capt. Thos. W. Williams, on "The Habits of the Walrus." A paper by Dr. G. F. Becker on "Rainfall in California" was also read. Mr. Lockington described "A New Species of Fish." Prof. Gustaf Eisen submitted a paper "On Anatomy of Oenodritus." B. B. Redding read an important and valuable paper on the "Climato of California," which we publish in full.

The following new members were elected: Miss Caroline L. Hunt, Mrs. L. M. F. Wanger, C. C. Cadman, Alex. Del Mar, Francis A. Holman, G. P. Rexford, Miss S. A. Plummer, Mrs. J. H. Sargent, Miss Jessie Smith, E. S. Parker, J. G. Lemmon, John T. Evans, Miss Helen Thompson, Mrs. M. E. Edwards. These ladies are the first ever admitted to membership in the Academy.

BULLION SHIPMENTS.—Since our last issue shipments of bullion from the prominent mines have been as follows: Manhattan, Jan. 15th, \$7,296.94; Grand Prize, Jan. 21st, \$30,760; Alps, Jan. 21st, \$2,389; Northern Belle, Jan. 19th, \$4,824.67; Endowment, Jan. 21st, \$1,375.79; Con. Virginia, Jan. 19th, \$139,736; California, Jan. 19th, \$153,206; California, Jan. 22d, \$212,902.22; Con. Virginia, Jan. 22d, \$198,143.75; Alps, Jan. 23d, \$5,460; Martin White, Jan. 22d, \$30,037.

A. L. FISH & Co., of this city have sold to the Town Trustees of the town of Vallejo one of the Clapp & Jones steam fire engines, for which they are agents. The engine is a very handsome one, and is bought subject to test.

News in Brief.

A \$10,000 fire occurred at Virginia City on Tuesday.

EUROPE is anxiously awaiting the peace negotiations.

FURTHER depredations by border thieves in Texas are reported.

NEARLY a hundred murderers were hanged in the United States last year.

The weather at sea off this coast has been very tempestuous of late.

The temperance movement is still progressing successfully in this city.

By the recent Connecticut railroad disaster, 13 persons were killed and 46 wounded.

THE United States has sued the Erie railroad to recover \$67,000, alleged back taxation.

SLADE, the "Medium," after being expelled from Vienna went to Berlin, whence he was also expelled.

THE Western Union company has increased its rates to the various points west of New York about 20%.

A BILL has been introduced into Congress to amend the law governing the appointment of postmasters.

RECENT shipments of American goods to Ceylon have been so successful that orders have been sent for more.

JOHN W. MACKAY and W. S. Keys have been appointed commissioners from Nevada to the Paris exposition.

THE funeral of McCarthy, the Fenian, at Dublin, is said to have been the most imposing display since O'Connell's burial.

JAMES GORDON BENNETT has purchased the steam yacht *Pandora*, and it is said she is again to be used for an Arctic expedition.

An official statement of the Russian Minister of Finances estimates the extraordinary expens occasioned by the war at 432,000,000 roubles.

THE run on several of the savings banks in this city this week was soon over, the depositors feeling assured that the draw was unwarranted.

THE Governing Committee of the New York Stock Exchange have voted to expel Netter and Bonner, who failed after re-hypothecating customers' collaterals.

J. W. BONES, the "Workingmen's candidate," has been elected State Senator from Alameda county, to fill the unexpired term of the late Senator Nathan Porter.

THE Supreme court has affirmed the decision of the lower court, in the case of John Runk, convicted of murder in the first degree, and he will therefore be hanged.

THE Empire pipe line, which carries the oil from wells in the Pennsylvania oil regions to the railroad, has been purchased by the United pipe line for about \$1,100,000.

THE Cherokee nation object to the Senate bill allowing Indians to become citizens of the United States. They think the bill is in conflict with the treaty obligation and acts of Congress.

THE Senate Finance Committee agrees to recommend the passage, with sundry amendments of the bill introduced by Senator Davis, of Illinois, to remit taxes on insolvent savings banks.

THE House Committee on Appropriations has finished the Fortification bill. It does not differ materially from the bill passed last year. It appropriated about the same amount, \$275,000.

OVER 1,000 men applied for work at \$1 per day in digging on the Southern Pacific R. R. ground on the Potrero. The men are paid every night. This is an indication of the "hard times" in this city.

AFTER a short deliberation, the jury in the case of Kearney, Wellock and Knight, on trial for misdemeanor, for the use of incendiary language tending to riot and breach of the peace, brought in a verdict of not guilty.

PROF. GEO. DAVIDSON delivered a lecture last Saturday evening on "Irrigation," being one of the course being given for the benefit of the Oakland Free Reading Rooms. The lecture was instructive, practical and interesting.

GEO. A. CROFUTT, author of "Crofutt's Trans-continental Guide," has lately been on a tour over every railroad in this State. He returned East this week and can be addressed at the Briggs' house, Chicago, for the present.

A CONSIGNMENT of 500,000 white fish eggs from the State hatching house at Northville, Michigan, have arrived in the city for consignment to New Zealand. A shipment has also been received for distribution in this State.

THIEVES and pickpockets are unusually numerous in this city at present. During the first 20 days of this month some 30 citizens have been garrotted, and either beaten or robbed, while on the way to their homes or places of business.

THE funeral of Victor Emmanuel, which took place in Rome on the 16th inst., was very impressive. The official portion of the procession was a mile long, and there were also 2,700 deputations from different parts of the kingdom.

TO SUBSCRIBERS.—We have recently made a contract with the publishers of *Hall's Journal of Health*, New York, to furnish us that old and popular publication, for any of our subscribers at 75 cents a year, postage paid. Any subscriber, old or new of the PRESS, can have the advantage of club rates for *Hall's Journal of Health* by sending us 75 cents. Regular subscription price, \$1.50.

THE ENGINEER.

Losses to Railway Investors in 1877.

We see by the *Railway Age* that during the year just closed the process of winding up and reorganizing railway corporations have gone on in the United States with even greater rapidity than in the previous year, whose record gave such an impressive and startling picture of the losses of railway investors. While the year 1877 has given, as was hoped, many encouraging evidences of the approach of better times, and the net earnings of most of our roads have shown a considerable improvement, still it was inevitable and expected that many more inflated enterprises would collapse under the shrinking process that has so mercilessly brought down values based on the standard of the era of speculation. It was hoped, however, that the number and aggregate amount of the bankruptcies for 1877 would at least not exceed those for 1876, but this hope, it will be seen, has been disappointed.

The *Age* gives a table showing a list of the railways sold under foreclosure during 1877. These cover 54 roads in all, whose total bonds, debt and stock (capital invested) was \$198,984,400. Total miles of roads 3,875. This is a truly appalling record of loss, as it must be remembered, foreclosure sales, as a rule, mean the absolute "wiping out" of the capital stock, and often of all mortgage liens except the first, though the purchasers under the foreclosing mortgage sometimes pay the floating indebtedness, that and their mortgage and the accrued interest representing the cost of the property to the purchasers, and therefore its approximate value after the shrinkage has been completed.

In addition to this is given a list of roads against which foreclosure proceedings have been commenced, generally accompanied by their transfer into the hands of the receivers, during the year. There is a total of 44 roads in this condition, whose total bonds, debt and stock (capital invested) amount to \$320,681,980. There are 5,409 miles of these roads.

There are also a number of roads ordered sold in 1877 but not yet placed on the auction stand. There are a total of 16 of these roads, comprising 2,388 miles, with total bonds, stock and debt (capital invested) of \$255,921,900.

Summarizing now from the above we have the following approximately correct comparative statement of the result of the wiping-out process during the last two years:

COMPARATIVE STATEMENT FOR TWO YEARS.			
	No. of Roads.	Mileage.	Capital Invested.
1876—			
Sold under foreclosure.....	30	3,846	\$218,000,000
Proceedings commenced.....	46	7,576	\$38,000,000
1877—			
Sold under foreclosure.....	54	3,875	\$198,984,400
Proceedings commenced.....	60	7,797	\$56,437,230

Eighty-four roads, with a complete mileage of 7,721 miles, or one-tenth of the entire railway system of the United States, and representing an apparent investment of \$400,000,000, also about one-tenth of the entire railway capital of the country, have in two years been sold under foreclosure, and have been "scaled down" to perhaps something like 50% of their original valuation. The figures for proceedings commenced, etc., are only given for the purpose of comparing the two years, as a number of the roads reported for 1876 under this head have during 1877 moved on to sale. But during the past year proceedings have been commenced against 44 roads with a mileage of over 5,500 miles, and it is safe to estimate that as a result of the two years' work at least 100 roads are soon to be sold, with an aggregate mileage of 12,000 miles and representing something like \$500,000,000! This fearful array does not by any means include all the roads already doomed to foreclosure, but still when these have passed through the ordeal and like their predecessors started anew on the basis of real values the awful era of foreclosures, it is safe to say, will be practically over, and capital, even though invested in railways, will again receive some return.

Irrigation in India.

On the 13th of December, at a meeting of the English East India Association, Gen. Sir A. Cotton read a paper on "The Prevention and Counteraction of Indian Famines." Sir A. Cotton insisted, says *Iron*, that there was no guess work or uncertainty about data on which he advocated irrigation and navigation works in preference to railways. Their necessarily higher rates greatly restricted traffic, and in case of disturbance they could not be so easily protected as water communication could be by armed steamers. There existed thousands of old tanks dependent on local rains, and these ought to be at once supplied by channels cut from the rivers. He differed from those who complained of the hopeless state of India, and believed that its advance was indicated by the increase of trade even without cheap transit, the increase of railway traffic at ruinous charges and the increase in the consumption of salt, of which the poor people did not eat half what they required. He contended that this concurrence of testimony justified the demand for a commission of known and approved men, independent of the India Office, to investigate the subject. Mr. John Jones dwelt upon the fertility of and the absence of famine in the district watered by the Madras Irrigation Company. Mr. Small, from Rajpootana, testified

that well-supplied tanks had promoted a material prosperity which secured the loyalty of a large population at the time of the mutiny. Mr. Bowden, an agriculturist from the Godavery district, testified to the traffic on its canals and the absence of famine in their neighborhood. Mr. Wood, who had been connected with a railway in Bengal, showed that canals were feeders of railways.

The Madras Irrigation and Canal Company, during the season from July, 1876, to April, 1877, had irrigated about 95,000 acres, being an increase of previous seasons of about 28%. The engineers of the company state that there is a growing feeling in the minds of the natives in favor of irrigation.

THE FUTURE OF THE ENGINEERS.—At a meeting of the Liverpool Engineering Society, December 19th, Mr. Graham Smith, gave an address on the "Status and Prospects of Engineers." The speaker said that the remains of canals, aqueducts, reservoirs and other works are to be found in Egypt, India, China, and, in fact, all over the world, clearly denoting that the ancients possessed men answering the description and filling the position which the engineer of the present day occupies. He said the works of the ancients were held in estimation by their kings and rulers, for among the titles of the god, Vul, were those of "Lord of Canals," and "The Establisher of Irrigation Works." At the present time the profession was little recognized, and titles were sparsely distributed to the leaders of the profession, but an engineer ought to care little about them, as by his own work he may gain more distinction and honor than it was in the power of all the crowned heads of Europe to bestow. To succeed as an engineer, a man must have ability and training to do his work, and he must love it, or the disappointments and hardships encountered during the earlier part of his professional career will possibly cause him to underestimate his capacities, and render him wanting in self-reliance and decision of character. Nevertheless, trials are almost necessary to the proper development of an engineer, just as iron must pass through the fire before it is converted into steel. The difficulties facing a young man about to enter upon a private practice he thought greater than those experienced in other professions, and remarked in conclusion that magnificent works yet remained to be carried out which would immortalize the names of the engineers.

HUDSON RIVER TUNNEL.—Work has been suspended until spring on the tunnel under the Hudson river, New York. Two shafts will be sunk, one in Jersey City, the other in New York, near Morton street. Then the excavation of the tunnel can be begun underneath the river, two bodies of men being at work. The ground on which the Hoboken (Jersey City) shaft is being sunk is made ground, and great precaution is necessary to guard against the possible caving in of the sides. A circular brick shell was first built. As fast as the earth was excavated from under it the wall sunk, while a gang of workmen kept piling more brick at the top, and in this manner the shaft has reached its present depth of 30 feet. It is to be 70 feet deep when finished. The tunnel will be 26 feet feet wide, 24 feet high, and, if the enterprise is profitable, it will be carried under New York and the East river, it is stated, to Brooklyn.

THE SUEZ CANAL.—Mr. Consul Perceval, in his annual report to the foreign office on the trade of Port Said, shows that the depression in trade has affected the traffic through the Suez canal, but he adds: "Notwithstanding the decrease in the total number of ships, 1,092 vessels under the British flag, amounting to nearly 75% of the whole traffic, with a tonnage of 1,578,238 tons net, passed through the canal during the year, being an increase both in British ships and tonnage of 31 in the former, and 100,492 in the latter. The canal has been kept in good working order, and the requisite depth of water maintained, with the usual amount of dredging, and the company have faced the hanks in various places with stone to prevent the sand falling in."

NORWEGIAN RAILWAYS.—The Norwegian railway system is being rapidly extended. There are now 364 miles of line in operation; these lines have been constructed at a capital outlay, including rolling stock, of £2,705,500. Further lines are in progress to the aggregate extent of 670 miles; the estimated cost of these lines is £4,230,780. Some of the Norwegian lines are on a 4ft. 8½ in. gauge, and others on a 3ft. 6 in. gauge. The 4ft. 8½ in. lines cost £7,930. per mile. The 3ft. 6 in. lines cost £5,070. per mile.

PROGRESS ON THE BROOKLYN BRIDGE.—The *Iron Age*, learns from Engineer Paine, of the East River Bridge company, that the close of the old year was signalized by finishing eight strands of the 19 which will form each of the four great cables. The cable work, therefore, is eight-nineteenths done, and the whole will be finished next summer. Work is going forward satisfactorily, with no delay from any cause other than that occasioned by short days.

IRON BRIDGE IN JAPAN.—A massive iron railway bridge over the Roktigo river, constructed for the use of the Tokio and Yokohama line, at an estimated cost of \$320,000, was opened for traffic on November 27th.

Old Bridges in China.

The most remarkable evidence of the mechanical skill and science of the Chinese at an early period, is to be found in their suspension bridges, the invention of which is assigned to the Han dynasty. According to the concurrent testimony of all their historical and geographical writers, Sangleang, the commander of the army under Kaou-tsoo, the first of the Hams, undertook and completed the formation of roads through the mountainous province of the Shersa to the west of the capital. Hitherto, its lofty hills and deep valleys had rendered communication difficult and circuitous. With a body of 100,000 laborers he cut passages over the mountains, throwing the removed soil into the valleys, and where this was not sufficient to raise the road to the required height he constructed bridges, which rested on pillars or abutments. In another place he conceived and accomplished the daring project of suspending a bridge from one mountain to another over a deep chasm. The bridges, which are called by the Chinese writers, very appropriately, flying bridges, and are represented to be numerous at the present day, are sometimes so high that they cannot be traversed without alarm. One still exists in Shensa, stretching 400 feet from mountain to mountain over a chasm of over 500 feet. Most of these flying bridges are so wide that four horsemen can ride on them abreast, and balustrades are placed on each side to protect travelers. It is by no means improbable (as Mr. Pauthier suggested) that as the missionaries to China made known the fact over a century and a half ago that the Chinese had suspension bridges and that many of them were made of iron, the hint may have been taken from thence for similar construction by European engineers.

A LONG ESTATE.—It is stated (with how much truth we do not know), says the *American Manufacturer*, that the oil producers have secured the actual ownership of a strip of ground extending from the oil region to the seaboard and of a width of one rod, through which to lay their proposed pipe-line. If one or more pipe-lines are laid to the seaboard, it will of course have the effect to diminish the number of inland refineries and build up refineries at the eastern terminus of the line, or lines.

The Emma Mine.

The renewal of shipments of ore from the celebrated Emma mine will naturally cause all who are or have been shareholders in the now almost defunct English company formed for working it to consider anew the value of the property they so thoughtlessly threw away. Throughout all the clamor as to the alleged deception practiced in the transfer of the mine to the English shareholders, as well as since, it has invariably been asserted in the *Mining Journal* that if any reliance was to be placed in the opinion of practical miners who had visited the property, but were peculiarly disinterested in the result of the working, the Emma was unquestionably a good mine, and worthy of development. That the English paid a large price for the mine is admitted, but that price was known to the whole world before the public invested one penny, so that the capitalists who speculated were like children who spend their money in coveted toys, then cry because the money is gone, and smash the toys to vent their spite. As the London Emma shareholders have now neither the capital invested nor the property, they can dispassionately consider their position, and estimate the advantages of patience and common sense in the conduct of mining operations, as compared with rashness and the love of litigation. From the time the Emma mine passed into the hands of the English company exploration (the one thing necessary to secure permanent profits in mining) was entirely neglected, and a system of careless management was carried on, which in a few months would bring into the winding-up courts even such properties as the Cape Copper, Liuares, Fortuna, Fontgibaud, and others equally successful. The London Emma shareholders appeared to suppose that even ordinary business energy and judgment were unnecessary, and that nothing had to be done but to receive the periodical dividends forever. Such marvelous benefits are not secured in mining any more than in any other business.

And the puerile simplicity of the shareholders is the more apparent when it is considered that the fact that the property was being ruined by bad management in the shape of neglect to provide for the future was well known to the shareholders long before it was too late to retrieve their position, and when even a small outlay upon explanatory work would have made the Emma property rank at least with the Richmond, or any other American concern on the English market, as a permanently profitable undertaking. Foremost in his reiterated assertions that the Emma was being crippled through inattention to development, was an esteemed correspondent of the *Mining Journal*—Mr. Henry Sewell—and the few of his facts republished last week suffice to show how small a drag upon the returns from the mine would have sufficed to do all that was necessary. Well may Mr. Sewell wish the readers of the *Journal* to be reminded how often he requested Mr. A. MacDougall to accept the £50,000 offered to the English shareholders by Messrs T. W. Park and Albert Grant to work the mine. It should be remembered that this sum was to be returned

only in case the mine paid for it—that is three-fourths of the net proceeds were to be for the English shareholders, the remaining one-fourth to be devoted to the payment of the £50,000. Mr. Sewell thinks there is no doubt that the English shareholders have been badly directed in their law-suiting business, and he mentions that he predicted to Mr. MacDougall that he would never gain this suit in America, which was a greater reason that the £50,000 should have been accepted.

The character of the rock in which the Emma mine is situated rendered exploration of even more than usual importance; and hence Mr. Sewell remarked in his pamphlet on the Emma (published when there was still time to have avoided the subsequent litigation, which very properly deprived the company of the mine altogether) that, owing to the geological features of the district, and especially the nature of the rock between which the ore body was found—stratified limestone—the future prospects, assuming ore to continue, would entirely depend upon the due working of the mine, so as to have proper reserves, and the due arrangements for development, such as provision for ventilation, and proper machine power for pumping and for raising the ore, and thus pushing on of exploratory works, so as to find further bodies of ore both horizontally and towards depth, as the then existing ore body in the deepest part of the mine showed signs of compression, and so might be expected soon to be reduced, and go off to a mere thread. Mr. Sewell was well aware that limestone formations, such as are found at the Emma mine, and in which he had some years' experience in Spain, Chile, Peru, and Mexico, and in which some of the richest ore bodies have been found, were often affected by such compressions, but so long as there was a continuance of the vein, however thin, there was a fair prospect of its again opening out, and producing as valuable a body of ore as was then being worked. He mentions that even in the celebrated Potosi mines, which for 246 years yielded the Spanish government £800,000 per annum as royalty, the veins were constantly being affected by these compressions, varying from several yards to the thickness of a pen-knife blade.

It is but justice to Mr. Sewell to state that his views appear to be now receiving full confirmation although at the time he wrote they were ignored from the circumstance, probably, of his opinion being diametrically opposite to those of Mr. Warren Hunsley, one of the original vendors and a large local shareholder; of Mr. Silas Williams, the mine agent; of Mr. George Attwood, the mine manager; of Mr. Clarence King, a celebrated American geologist; Prof. Murray, a mineralogist; and Mr. John Longmaid, who condemned a neighboring mine as containing no ore worth raising, though the succeeding proprietor quickly raised 2,000 tons of silver-lead ore, and continued to turn out regularly 300 tons per month with good profit. That Mr. Sewell wrote from actual knowledge, and not from mere hypothesis, seems evident, since in July, 1872, he made an affidavit in one of the local courts that the Emma mine was a bed vein and that it would be proved to be the same as the Flagstaff, Vallego, and several other mines in the district. The correctness of this has now been proved by subsequent events, for the Emma mine is continuous for about 10,000 feet, and is not an isolated body of ore as was supposed by some. Upon these facts Mr. Sewell very reasonably argued that the length of the Emma vein having been proved by actual work of the mines that are situated on the same vein for a distance of 10,000 feet, such as the Flagstaff, Vallego and other, to be a master vein, it is but reasonable to suppose that new ore bodies will be found in depth as well as in length, as already stated. Mr. Sewell explained that the Emma, at the time he examined it, exhibited distinct and marked characteristics of a well-defined segregated strata vein; the footwall has a regular pitch into the hill of about 45°, and a course in a north-westerly direction, corresponding with the footwall in the Flagstaff mine, which development will, in his opinion, prove to be identical with that of the Emma. The accuracy of Mr. Sewell's views will certainly add to his already high reputation as a mining engineer, and, although the Emma mine has been lost to the English capitalists a compensation may be found in the neighboring mines which are still in English hands.—*London Mining Journal*.

RED BLUFF.—The population of Tehama county is a little upwards of 7,000. Nearly one-half the number are residents of Red Bluff, the county seat, and one of the best business points found anywhere on the upper Sacramento. It is eligibly located, on the line of the Oregon and California railroad, and neatly laid out on an elevated bench on the west bank of the river, but by no means on an abrupt bluff of very considerable height, as one might be led to imagine from the name. Both its situation and surroundings, may well be looked upon as more than usually attractive and beautiful. Its court house and other public buildings, inclusive of a very large brick school house, are of the most substantial character, to say nothing of a large public hall, and similar buildings erected by the Masons and Odd Fellows, two fine churches and the many neat private residences that adorn the town and its suburbs. The Sacramento is spanned at this point by a well-constructed bridge, which puts the town in easy communication with Antelope valley, one of the richest and most beautiful in the county. It is all settled up by well-to-do farmers.

The Small Districts in Utah.

Several years ago, says the Salt Lake Tribune, there was quite a breeze of excitement raised here over the discovery of mineral in City Creek canyon. Many discoveries were located and a new district organized, extensive prospect work was done on several of the claims, but no rich strike was made, though extensive bodies of ore carrying a large per cent. of iron and a limited number of ounces of silver were found. It did not pay, however, to ship except for flux, and the discovery of plenty of good material of this character near Ogden and in Tintic about the same time, shut the City Creek mines out of the market. The claims, however, were never abandoned, and last summer about 30 men were at work in the camp taking out iron ore for fluxing and shipping it to the smelters of Salt Lake county.

Last March the discovery of silver-bearing rock in

Red Butte Canyon

Was made, and caused some excitement, but there was something of a "job" about the affair, which caused all hands to drop it with disgust. Ore very strongly resembling that found in Leeds, is to be found there, and honest assays made of it showed it to carry from 12 to 20 ounces of silver and considerable copper. There is another district on the same mineral belt as the City Creek mines, situated in

Hard Scrabble Canyon,

In Morgan county, where a number of claims have been worked to considerable extent, with about the same results as have been obtained in City Creek, the ore taken out being chiefly iron, together with some pyrites and sulphur.

Since the Carrio Steele mine changed hands, little or nothing has been heard from

Camp Floyd District,

Through a number of miners still are picking away in their claims there, and are shipping a few tons of rich ore from time to time. It is true this camp has gone down badly, but it is not the fault of the mines, as there are some very fair prospects in the district which need only a little outlay of capital and labor to make them paying properties. But the camp has been in bad repute because some New Orleans men made a bad investment there and then accused the whole Territory of being a fraud.

In Dugway District

There are some fine pieces of mining property which need development only to bring them to the front. The district is situated near the line between Utah and Nevada, and is not a great distance from White Pine. In the summer of 1876 a Chicago company went in there, built a smelter, got possession of the best prospects without paying for them and then drew out. The whole property was thrown into litigation soon after and has since been lying idle.

Clifton District

Is south of Dugway, approaching nearer in its location to Osceola, Nevada, where the dry placer gold diggings are panning out so well. Several miners have spent the summer in Clifton and have located a number of claims bearing rich rock. Everything in.

Columbia,

West of Great Salt Lake, has been quiet during the past summer. There are several very fine claims in the district, but cheap transportation, more capital, enterprise and energy are wanted to make them pay. In this connection it will be well to call the attention of the country to the fact that our numerous

Coal and Iron Fields

In Southern Utah remain undeveloped. Near that Valley of Death where the saintly Mormons butchered a train of emigrants 20 years ago, there is a mountain of iron lifting its head thousands of feet above the sea and spreading its base over miles, and many miles of country. Its quality is very fine, being equal, as experiments show, to some of the best kinds of iron produced in America. What is true of our iron mountains is also true of our coals. The beds already discovered in southern Utah in close proximity to the iron, are simply immense; so that in the not distant future this Territory is destined to rank as the leading iron and coal State on the Pacific coast.

Table Mountain Mining District.

The miners in Table Mountain district have instituted a move towards giving a new impetus to the mining interest in that district, and thereby developing the rich mines that are to be reasonably supposed exist in the mountain. We notice their having revised the district mining laws in several important particulars, with a view of removing what heretofore has been the main source of the depressed state of mining in the district for the past 12 years, many claimants having taken the full benefit of the law which has been in force, that by payment of \$1 it made the titles to claims valid for one year without the performance of any labor whatever. The effect has been to drive capital and labor from the district. It is the generally expressed opinion that the action of the miners, which met at the Raw-Hide school house, is wise and the course pursued is just and proper, and will inevitably tend to the rapid development of the extensive deposits of gravel known to exist in the mountain and the working of the same on a more extended scale than the old system of working. The wealth stored up in the mountain, which only awaits the energy and

perseverance of the sturdy miner, with pick and shovel to unearth it, is immense. It may be considered as the commencement of a new era in mining in that district. The opening out of claims in the mountain requires, as a matter of course, a great amount of labor; and labor, we say, is cash, yet naught but labor accomplishes the end. Cash capital necessary to open out the claims located or that may be hereafter located on Table mountain gravel range, in every instance, we believe, can be commanded by any company of miners that show a determination of pushing forward and overriding every obstacle that may present itself, with the view of searching the channel at all hazards. This channel or ancient river bed lies hundreds of feet beneath the volcanic matter of which the mountain is formed. There is a vast extent of these Table mountain gravel deposits in this county, unapproached by the prospector's pick. There is no reason to doubt the existence of as rich deposits in the unexplored portions of the channel as has ever been discovered. It is interesting to know the miners, instead of abandoning hope, are preparing in the right manner to revive the mining interests which has languished for years.—*Tuolumne Independent.*

USEFUL INFORMATION.

Cheap Fuel.

The recent rise in coal has caused considerable excitement among steam users, and the old question comes up again, "What can we use to reduce the cost of fuel?" The *American Manufacturer* says: Coal screenings are becoming more in use, and with a small mixture of bituminous coal can now be burnt without using a blast under boilers set with the Jarvis furnace. For years attempts have been made to utilize immense fields of peat in the New England and Middle States. To do this it was necessary to carefully cut it in squares and dry it. Machinery was invented to do this, but the cost of cutting and drying was so large, especially the long time required in drying, that at the present time the matter has been generally abandoned. Recent experiments have been made with fresh dug peat wet from the meadow, without even cutting in squares or drying, and it has been found that with a small mixture of coal screenings or soft coal this can be used under boilers set with the Jarvis patent furnace without using a blast. It makes an immense heat with very little smoke. Before burning dry peat it was found that the gases would fill up the flues, but in the Jarvis furnaces these are fully utilized by the hot air supplied on the top of the fires and the flame varies from white to a clear green color.

SWISS PATENTS.—The *Public Ledger* says in an article upon the subject of patents in Switzerland, that public sentiment in Switzerland is beginning to look with favor upon patent laws, and a loss of a good deal of their watch-making trade, mainly because a Swiss inventor could not be protected, has caused considerable feeling on the subject. Federal Councillor Droz has prepared a bill for a patent law, which has been published in the Swiss journals, and is thus presented to the people. Patents of importation will be granted to inventors living abroad only on the principle of reciprocity. The maximum duration of a patent is to be 15 years. An application fee of 30 francs will be charged, and an annual fee of 30 francs each for the second and third years. Every subsequent year a surcharge will be levied at the rate of 20 francs more than the amount paid in the preceding year. If the inventor refuses to permit the use of his invention by voluntary agreement, the question may be submitted to the Federal Tribunal. The Federal Patent Office may, under certain conditions and circumstances, declare a patent void or withdraw it. The Patent Office is to be composed of three permanent members, elected by the Federal council for six years, and several examiners. The Patent Office must transmit the appeal of an applicant who gives serious reasons for impugning the decision by which his invention was refused a patent to a court composed of at least three examiners, among whom must be none who made the first examinations. The applicant may appeal from this court to the Federal Tribunal, which, hearing fresh experts chosen from Switzerland and abroad, gives the final judgment. No additional fee is charged for an appeal against a first decision. The judgment of the Federal Tribunal is always accompanied with the costs of the appeal.

DOSE FOR RODENTS.—The following cheap and simple method is said to be used in Germany: A mixture of two parts of well-bruised common squills and three parts of finely-chopped bacon is made into a stiff mass, with as much meal as may be required, and then baked into small cakes which are put down for the rats to eat. Several correspondents of the *German Agricultural Gazette* write to announce the complete extermination of rats and mice from their cow-stalls and piggeries since the adoption of this simple plan.

VIOLET INK FOR RUBBER STAMPS.—Mix and dissolve the following: Aniline violet, two to four drachms; alcohol 15 ozs.; glycerine, 15 ozs. The solution is to be poured on a cushion and rubbed in with a brush.

SETTING A BOILER.—In setting a boiler, the location should be as near the engine as possible and free from exposure to currents of air, and should afford convenient access to the flues and fill-pipe connections and general convenience to the fireman. If possible, an out-building should be selected. As it is important to keep the boilers level and to maintain a uniform water line, good foundations must be secured. The side walls must be 12 to 16 inches thick; the furnace and front wall lined with fire-brick; the top should be covered with brick and the steam dome and pipes with felt or other material, to prevent radiation. If the boilers are not suspended, the front end should rest on the fire front and the back end on a stand of cast iron. If a mud drum is used, it should have a rest of good masonry, but the weight of the boiler must not be sustained by it. The stand-pipe should not be used for supporting and supplying the boilers. It makes a joint in an inaccessible place and is liable to leak and rust the sheet to which it is attached. If a mud drum is not used, supply into the back end of the boiler with wrought-iron pipe, using the same pipe for supply and blow-off. A new furnace wall is liable to crack. This should be repaired at once. And at all times the furnace walls and coverings should be kept in perfect order.

A SUBSTITUTE FOR TIN.—It is stated that columbium has been found in large quantities, in Marion, U. S., and in the Amazon stone of Colorado. In color it stands midway between nickel and tin. It can be applied to the surface of other metals like the two just named, and the *Manufacturer and Builder* prophesies that we shall soon hear of columbium-plating. It is slightly lighter than tin, and in its chemical properties, while somewhat similar to the latter, are more nearly allied to those of bismuth and antimony. At present there is little immediate prospect of its becoming an article of commerce. But we must remember that aluminium was not many years ago as little known and rarely seen as columbium, *alias* niobium.

LOST FREIGHT.—The item of lost freight in railroad affairs amounts to a good deal in the course of a year. The Pittsburg, Fort Wayne and Chicago road employs four clerks to look after lost freight. Much of it is found and restored to owners, but the losses in one year to the road amount to about \$20,000. This includes goods of all kinds, principally boots, shoes, and the finer grades of dry goods.

IRON GRINDERS.—Instead of millstones, chilled iron rolls are beginning to be used in England for the purpose of reducing wheat and other kinds of grain.

GOOD HEALTH.

Why Gum and Pine Trees are Good Neighbors.

EDITORS PRESS:—There have been many contradictory rumors abroad in this State respecting the desirability of gum trees around dwellings. We lately were solemnly assured that they were poisonous. No doubt this rumor has reached many readers. As I once heard Spurgeon say: "A lie runs round the world while truth is putting his boots on."

Truth's last new boots then, must be as to gum trees, that they exhale those powerful purifying, antiseptic compounds, peroxide of hydrogen and camphoric acid. A Mr. Kingzett, in England, has been paying much attention to the subject, and has succeeded in producing a new disinfectant, called "Sanitas," containing these compounds. His method consists in decomposing water and turpentine, placed in juxtaposition, by a blast of hot air. "Sanitas" is not only useful as a disinfectant, but also as a preservative in curing meat; preventing and even overcoming decomposition.

The lesson is, keep your houses salubrious and your meat untainted by encircling your dwellings with blue gums.

EDWARD BERWICK.

Monterey Cal.

[The points made by our correspondent are fortified by experience in Africa. It is hardly more than 15 years since the first eucalyptus trees were introduced into Algeria, yet their growth has been extraordinarily rapid. Some remarkable examples are given of the action of the eucalyptus in improving the sanitary condition of unhealthy districts. Formerly it was impossible for the workmen at the great iron mines of Mokta-el-Hadid to remain there during the summer; those who attempted to do so died, and the company was obliged to take the laborers to the mines from a distance by train every morning, and to carry them back every night. From 1868 to 1870 the company planted more than 100,000 eucalyptus, and now the workmen are able to live all the year through on the scenes of their labor. The entire works and the railway leading to them are bordered with thick belts of these trees, and each of the miners has his cottage and kitchen garden surrounded with them.—*Eds. Press.*]

MATHEMATICS AND MEDICINE.—Mark Twain, in *Atlantic* for November, says: Among other talks to-day, it came out that whale ships carry no doctors. The Captain adds the doctorship to his own duties. He not only gives medicines, but sets broken limbs after notions of his own, or saws them off and sears the stump

when amputation seems best. The Captain is provided with a medicine chest, with the medicines numbered instead of named. A book of directions goes with this. It describes diseases and symptoms, and says: "Give a teaspoonful of No. 9 once an hour," or, "Give 10 grains of No. 12 every half hour," etc. One of our sea captains came across a skipper in the North Pacific, who was in a state of great surprise and perplexity. Said he: "There's something rotten about this medicine-chest business. One of my men was sick—nothing much the matter. I looked in the book; it said give him a teaspoonful of No. 15. I went to the medicine chest and I saw I was out of No. 15. I judged I'd got to get up a combination somehow, that would fill the bill, so I have into the fellow half a teaspoonful of No. 8 and half a teaspoonful of No. 7, and I'll be hanged if it didn't kill him in 15 minutes! There's something about this medicine chest system that's too many for me!"

Cause of Decayed Teeth.

A writer in the *British Medical Journal* gives some valuable suggestions on the preservations of the teeth: The general prevalence of dental caries is chiefly owing to food remaining on and between the teeth after meals—from breakfast time till the following morning—when, according to custom, the teeth are brushed; brushed, but probably not cleaned, as the brush is more often used to polish the surface merely than to assist in removing what has accumulated between them. Experiments have been referred to that prove the solvent action of weak acids on the teeth; and I think it will be conceded without proof that, were portions of our ordinary food, mixed and moistened as in mastication, kept during the night at the high temperature of the mouth, the compound would be sour. It follows that dental caries must continue to prevail as now, while it is the custom to allow the food to remain in contact with the teeth all night.

The following observations show the dependence of caries on food remaining in contact with the teeth. When the teeth are wide apart food is not retained, and they generally remain free from caries. The lower front teeth are seldom attacked by caries when, as is generally the case, the spaces between are closed to the entrance of food by tartar. The backs of all the teeth, upper and lower, being kept free from food by the tongue, are seldom affected by caries. Lodgment of food takes place between the bicuspid, between the molars, in the depressions on the masticating surface of these teeth, and on the buccal walls of these molars, and these are the chief seats of caries. While mastication is performed by the molars and bicuspids, the upper front teeth remain free from food and from caries; but, when they themselves are made to do the work of lost or diseased molars, and the food gets between them, caries is certain to follow before long. Further proof cannot be required that, if no food remained in contact with the teeth after eating, they would be free from caries, unless acted on by acidity from other sources. The only indications, therefore, for the prevention of dental caries are the neutralization of acid applied to the teeth and the removal of food before it has become acid. The food should be removed after every meal, and all who have not the opportunity of doing so should not fail to remove it every night at bedtime by rinsing, as the brush cannot be trusted to remove the food from between the teeth.

Wholesome Water.

At a recent meeting of the New York Academy of Science Prof. A. R. Leeds read a paper on the relation between fish and plant life and the probability of drinking water. The subject of the wholesomeness of drinking waters was brought prominently before the public of this section by the excessive mortality of the fish in the Passaic river during last June. This appeared of such importance to the Professor that he made two visits to Paterson to collect information. No naturalist appears to have examined into the nature of the disease. Its external indication was the formation of a soft spot on the side of the fish, and death speedily followed the rapid growth of this spot. That the refuse of factories was not the cause was plain from the fact that the fish had died in great numbers above the falls even in the tributaries of the Passaic, and also in isolated bodies of water like Rockland lake. Mr. John Roe, one of the fish wardens, stated that the water was unusually low during the epidemic and the weather had been excessively hot. Where the disease was most prevalent, the depth of water varied from three to eight feet. It appeared also that at this time unusual amount of aquatic plants of a low order had invaded the stream. The following inferences may be drawn: 1. That the rapid development of vegetable growth may be attended with the production of spores or gemmules forming a specific poison to fish life. 2. That the organic impurities arising from the action of the sun upon shallow water and the gases evolved may originate disease. 3. The supply of oxygen might fall below the point requisite to the support of life by being consumed in the oxidation of vegetable matter; by the partial exclusion of the air from the water by the crust of floating algae; and by a diminution in the supply of highly aerated water from levels by reasons of the drouth. A very heavy rain put an end to the epidemic. The third hypothesis seems the strongest.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—The American Pipe Company's Pipe; Ball's Excavator, 49. The Week; The Climate of California, 56-57-61. The Raymond & Ely Mine, 53.

ILLUSTRATIONS.—Patent Wooden Pipe for Water, Gas, Etc., 49.

CORRESPONDENCE.—From Globe District, Arizona; Heath District, Idaho, 50.

MECHANICAL PROGRESS.—French Rewards for Inventors; Pneumatic Transmission in Germany; Loss from Heated Bearings; Wrought and Cast-Iron Break Shoes; A Steam Sled; Damascus Blades; Oil Pipes in Russia; Electric Lamp Lighting; Duty of Scientific Men; Steel Compressed by Steam; Lemon Wood, 51.

SCIENTIFIC PROGRESS.—Change of Habits in Foods; Chance for Midnight Battles; A Mysterious Geological Reptile; A Parasitic Caterpillar; Scorpions as Stridulators; Balloons and Science; Bismuth; A New Theory of the Nature of Water, 51.

MINING SUMMARY from the various counties of California, Nevada, Arizona, Colorado and Montana, 52-53.

NEWS IN BRIEF on 53 and other pages.

THE ENGINEER.—Losses to Railway Investors in 1877; Irrigation in India; The Future of the Engineers; Hudson River Tunnel; The Suez Canal; Norwegian Railways; Progress on the Brooklyn Bridge; Iron Bridge in Japan; Old Bridges in China; A Long Estate, 54.

USEFUL INFORMATION.—Cheap Fuel; Swiss Patents; Dose for Rodents; Violet Ink for Rubber Stamps; Setting a Boiler; A Substitute for Tin; Lost Freight; Iron Grinders, 55.

GOOD HEALTH.—Why Gum and Pine Trees are Good Neighbors; Mathematics and Medicine; Cause of Decayed Teeth; Wholesome Water, 55.

MISCELLANEOUS.—The Bonanza; Temperature and Rainfall; Rainfall at Sacramento; Mines about Pine Grove and Salt River Nevada, 50-58. The Emma Mine; Red Bluff, 54. The Small Districts in Utah; Table Mountain Mining District, 55.

MINING STOCK MARKET.—Sales at the San Francisco, Pacific and California Stock Boards. Notices of Assessments, Meetings and Dividends, 60.

NEW ADVERTISEMENTS.

Combination Pipe, American Pipe Company, S. F.; Skid more's Mining Statistics, Sumner Whitney & Co., S. F.; Drawing Instruments, Etc., G. S. Woolman, N. Y.; National Pronouncing Dictionary; The Climate of California; Farm for Sale, Dewey & Co., S. F.

The Week.

The past week has been such as we have been hoping for. The welcome rain has been falling pretty continuously all over the State, and already some of the farmers in the northern coast counties are beginning to cry "hold, enough!" To the miners, however, the bounteous rains are welcome and the more the better. The nozzles are hard at work in every direction throwing the streams of water into the gravel banks; the quartz mills which are run by water power and have been "hung up" so long are pounding away at the accumulated ore on the dumps and the miners are happy. A good mining season is already assured and we are pretty certain to reach the twenty millions' product of bullion this year. The mining news from all directions is cheering, and consequently altogether different from what it has been for the past few months. As we write, Thursday, the rain is pouring down heavily.

We give considerable space this week to an article by Mr. Redding on the "Climate of California," which is worth of careful consideration. The length of the article prevents our giving the usual illustration on the ninth page of the paper, but the occasion warrants the omission.

The suspension of Robert Mitchell & Co., brass founders and plumbers, of Montreal, is principally due to the competition of American goods. Their creditors have given them permission to carry on business under an inspector. Their liabilities are \$100,000.

The Climate of California.

The following interesting paper was read at the last meeting of the California Academy of Sciences by Mr. B. B. Redding. The subject is so important and is treated with such skill and thoroughness, that we give the paper in full. Mr. Redding has had exceptional facilities for collecting statistics on the subject, and has been gathering data for this article for the past six months. The highly valuable information it contains is given in a condensed form, and the paper affords a better explanation of the laws governing the climate of California than has heretofore appeared in print. The article is worthy of careful perusal and preservation:

The temperature of the air, course of the wind, rain and snowfall, are taken daily at 7 A. M., 2 P. M., and 9 P. M., at 83 stations of the Central Pacific and Southern Pacific railroads and their branches, extending from San Francisco to Ogden, Lathrop to Fort Yuma, San Francisco to Soledad, Sacramento to Redding, Sacramento to Willows, and Vallejo to Calistoga and Petaluma. The temperature of the water is also taken at several points, including five stations on the Sacramento and San Joaquin rivers.

In addition to the observations made by the United States Signal Service, the Coast Survey and those made at all the military posts, we thus have three daily observations recorded at 83 stations on the Pacific Coast, extending through eight degrees of latitude and 12 degrees of longitude. These have been kept for the use of the companies, and for the benefit of the people residing in the vicinity of the various stations. As each new station is reached in the construction of a railroad, the agent is supplied with proper instruments, and the record required to be kept. On all the roads first constructed the record has been kept for more than 10 years. On the new road over the Colorado desert from the San Bernardino mountains to Fort Yuma, of course the record is only for the past year. The record of these three daily observations, for even 50 stations for 10 years, makes an army of figures that it is almost appalling to attack; yet, when reduced, and the mean obtained, the results are of great importance, not only to the farmer, but to every citizen. As an illustration of the

Financial Importance of these Records,
That came within my personal observation: In 1869 some gentlemen made an investment of nearly \$50,000 near Summit Station, in the construction of sheds over some lakes under which to cut ice for the San Francisco market. They found it impossible to erect any wooden structure sufficiently wide for their purpose that would bear the weight of snow that annually falls at that point. Their structures are in ruin, and every dollar put into the enterprise (other than it gave a small army of men employment in the erection of their buildings) is lost. Could the gentlemen have consulted these records they would have seen that the annual average rainfall at this point is more than five feet. Nearly all of this falls in the form of snow, and is equal—if the snow that falls did not become compact or melt—to a bank of snow on their lakes and the roofs of their buildings, each winter, of 60 feet in depth. If the farmers who have made settlements on the west side of the San Joaquin river, and have tried unsuccessfully for years to raise crops upon them without artificial irrigation, could have seen the results in the hard, unyielding facts these figures disclose, they would know that they hope in vain for rain, and also hope in defiance of the laws that control climate. They live in a section of the State that is an exemplification of the truth of the law, well stated by Guyot: "That when a mountain chain opposes a horizontal wind the air is forced up along the slopes; its vapors are condensed, and water the side exposed to the wind, while on the opposite slope the same wind descends into the valley dry and cloudless." The western slope of the Mount Diablo range, in the latitude of San Francisco, receives about an annual average of 20 inches of rainfall. Ellis, in the same latitude, on the eastern side of the same range, has but an annual average of 9 and 22-100 inches. Modesto, a few miles further south, on the opposite side of the San Joaquin, has but 8 95-100 inches. Still further south these averages continue to decrease, until, on the west side of Tulare lake, the annual rainfall cannot exceed three inches. The record of this point has been kept for so short a period that the amount cannot be stated positively, but applying to this section of the State the well-known

Laws Controlling Climate.

It will be found in time that this estimate is not far from correct. I have thought it of interest to condense some of the results of all these observations, as they show that considering the elements of disturbance in the facts that this State has, on one side, the vast Pacific ocean, presenting a uniformly radiating and absorbing surface, and on two other sides, vast tracts in the Colorado, Mohave and Nevada deserts, presenting rapidly absorbing and radiating surfaces. Yet California is controlled by the same universal laws that control climate in other places. A statement of some of these laws and the application of them to the records obtained of the temperature, prevailing wind,

and annual rainfall, it will be seen that until the isthmus of Panama sink beneath the ocean, and allows the Gulf stream to pursue its way into the Pacific, or some other great change takes place in the physical geography of the earth, the climate of any given section of this State is not exceptional, but just such as these laws show it should be.

Prof. Joseph Henry, in his "Contributions to Meteorology," has done so much to clear up the

Mystery of the Winds.

And has stated these laws so concisely, that it is a pleasure to quote from him. He says: "If the earth were at rest, it is obvious that the air expanded by the sun's heat at the equator would rise up and flow over, descending as it were an inclined plane towards the poles, where it would reach the earth's surface, and flow back to the equator, and thus a perpetual circulation would be maintained. It is further evident that since the meridians of the earth converge, all the air that rose at the equator would flow along the upper surface entirely to the poles, but the greater portion would proceed on further north or south than latitude 30°, for the surface of the earth contained between the parallel of this degree and the equator is equal to that of half of the whole hemisphere. Portions, however, in the northern hemisphere would flow on to descend at different points further north; and of these portions, some probably would reach the pole, and there sink to the surface of the earth, and from that point diverge in all directions in the form of a northerly wind. Between the two ascending currents near the equator there would be a region of calms or variable winds. The currents which flow over towards the poles, would descend with the greatest velocity at the coldest point, because there, the air would be densest. Now, the earth is in rapid motion on its axis from west to east, and every particle of air, therefore, flowing from the north to the equator, would partake of the motion of the place at which it started, and would reach in succession lines of latitude moving more rapidly than itself. It would therefore lag behind continually and appear to describe on the surface of the earth a slightly curvilinear course towards the west, and hence the northeast trades in the northern hemisphere and the southeast trades in the southern hemisphere—where the conditions are reversed, but both blowing towards the belt of greatest rarification. The particles of air approaching the equator will not ascend in a perpendicular direction, but will rise continually as they advance towards the west along an ascending plane, and will continue for a time their westerly motion in the northern hemisphere. After they have commenced their return towards the north, and until they arrive at parts of the earth moving more rapidly than themselves, they will gradually curve towards the east, and finally descend earthward to become again a part of the surface trade-winds from the northeast. The atoms will move westward as they ascend; 1st., on account of the momentum in that direction, and 2d., because as they reach a higher elevation, they will have less easterly velocity than the earth beneath. They will also be affected by another force, first pointed out by Mr. Ferrell, due to the increase of gravity which a particle of matter experiences in traveling in a direction opposite of that of the rotation of the earth. The last mentioned cause of deflection will operate in an opposite direction on atoms when they assume an easterly course. The result of the complex conditions under which the motive power acts in such a case would be to produce a system of circuits inclined to the west, the eastern portion of which would be at the surface, and the western portion at different elevations even to the top of the atmosphere. The greater portion of the circulation would descend to the earth within 30° of the equator, giving rise to the trade-winds; another portion would flow further north, and produce the southwest winds, and another portion flowing still further north would descend to the earth as a northwest wind. The air which descends in the region of the north pole would not flow directly southward, but on account of the rotation of the earth would turn toward the west and become a north-easterly current. It might appear at first sight that the north wind which descends from the polar regions would continue its course along the surface until it joined the trade-winds within the tropics; but this could not be the case on account of the much greater western velocity which this wind would acquire from the rapidly increasing rotary motion as we leave the pole. There would therefore be three distinct belts in each hemisphere—namely, the belt of easterly winds within the tropics, the belt of westerly winds within the temperate zone, and the belt of northwesterly at the north."

Without doubt these laws would operate uniformly if the earth were a perfect smooth sphere with a uniformly radiating and absorbing surface, but it is broken by mountain chains, covered by large tracts of desert which rapidly absorb and as rapidly radiate heat; about three-fourths of its surface is water, which slowly absorbs and as slowly gives up its heat; the water of the ocean is in circulation producing great currents which in this hemisphere carry a portion of the heat of the tropics into northern latitudes, and the cold of the north into warmer latitudes. All of these causes interrupt the uniformity of the

Flow of the Aerial Current.

Changes its temperature, and give rise, as well

as direction to local winds. The zones of tropical winds move bodily to and fro with the vertical sun, northward during our summer, and southward during our winter; the belts of westerly winds in the temperate zone move north and south with these. As California is within the northern temperate zone, it is primarily to the movement as a body, north and south, of this belt of wind, that we are indebted for our dry summers and winter rains, where, within the tropics, the northeastern and southeastern trade-winds meet, is a region of calms and rains. This belt of calms and rains, as has been stated, moves northward and southward with the sun's declination, where within the temperate zone the northern and north-westerly winds from the polar regions meet the westerly return trade-winds, is a region of storms and rains. These belts also follow the sun's declination north and south.

Applying these Laws to this Coast.

At our midsummer, the vertical sun would be on the Tropic of Cancer, and in that vicinity the northeasterly and southeasterly trade winds would meet, create ascending air, consequently calms; this air, laden with moisture, would rise into cooler regions, when a portion of its moisture would be precipitated, making tropical rains; this air would flow north and south towards the poles. Confining our view to that portion which would flow towards the north pole, the larger part of it must descend to the earth within 30° of latitude, under the law as stated by Prof. Henry; as in going north it continually has to pass over a portion of the earth which is moving less rapidly than the portion it has left, it is deflected and becomes a south-westerly wind. The greater portion of this upper current, having descended to the earth within 30°, and returned to join the trade-wind, the remainder would flow towards the pole, portions descending in its course at all points where the rarification of the air near the earth's surface would permit. These descending currents cause the local variable winds of our temperate zone, but the aggregate of all of them is the prevailing southwest return trade wind. The descending currents cannot give rain, as they can only fall to the earth when they become colder than the air near the earth's surface. In falling they are constantly arriving at places of warmer temperature than those they have left; they, therefore, change to a condition of taking up moisture rather than of parting with it. Where the great body of the descending return trade-wind reaches the earth between latitudes 25° and 35° must therefore on this coast be comparatively a rainless region.

Other lessening portions of the upper current would pass on until they met the prevailing northerly wind from the polar regions, when their temperature would be lowered and their moisture condensed, and fall as rain. The conflict of this descending current with the polar wind would create storms and give rise to electrical phenomena. The prevailing northerly polar wind reaches to about latitude 60° varied by the declination of the sun. This view of the causes of the tropical, temperate and polar zones of prevailing winds, is in accordance with the theoretical deductions of Prof. Ferrell concerning the course of atmospheric currents moving on a sphere, and appears to be confirmed by the belts of low barometer prevailing in the vicinities of the equator, and of latitude 60°. The polar wind being colder is heavier than the return trade-wind, and where they meet the tendency is for this polar wind to become a surface wind and prevent the upper current from reaching the earth, until it has been reduced to the same temperature.

The operation of these general laws can be

More Clearly Seen on this Coast

Than on that of the Atlantic and Gulf States. There, the northeast trade-winds are forced into the great cauldron of the Gulf of Mexico. The Cordilleras of Central America and Mexico form a wall against their progress, they rise, turn to the north as an upper current, and return to the earth as southwest winds. The Rocky mountains, one great chain of which extends from the center of the continent northwesterly to the Arctic ocean, assisting in the deflection. The great prairies extend in an unbroken line in the same direction from the mouth of the Mississippi to the same frozen ocean at the mouth of Mackenzie river in about latitude 62°. Prof. J. W. Foster, in his work on "The Physical Geography of the Mississippi Valley," states that the sources of the Mississippi river are but 1,600 feet above the ocean. Prof. Coffin has shown from the records in the Smithsonian Institute, in his article on the "Winds of the Northern Hemisphere," that between latitudes 60° and 66° there prevails a belt of easterly and northeasterly winds. These winds coming from the Arctic ocean meet the great chain of the Rocky mountains, are deflected into north-westerly winds and pass unobstructed along this great stretch of prairie land into the States east of the Rocky mountains. The conflict between the northwest polar winds, and the moisture-laden southwest wind from the Gulf of Mexico gives all the Atlantic States north of Florida, their summer rains. As far back as 1850 Prof. Espy, in his second report on meteorology to the Secretary of the Navy, without, at that time, more than suspecting the cause, reported, as the result of a long series of observations, that in the northern part of the Atlantic States the winds generally, in great storms set in from the north of east and terminated from north of west, and in the south-

ern part of the Atlantic States they set in from south of east and terminate from south of west.

The States east of the Rocky mountains are the great battle ground on this continent of these hot and cold winds. It is doubtful if the Atlantic trade-winds ever give rain to California. That portion which passes the mountains through the Valley of the Rio Grande precipitating its moisture on the White mountains and Black hills of Arizona, which, by the meteorological records of the Smithsonian Institute, are shown to have an annual average of 20 inches of rain.

Application of These Laws to California.

That these general laws may be applied to California as the cause of our climate, I will assume to follow a given portion of air along well-known points on the coast. At midsummer, at noon, the sun would be vertical in southern California, just north of Cape St. Lucas. In this vicinity this portion of air having been a part of the trade-wind would have become heated, and saturated with moisture. It would rise until it met colder regions, when it would part with some of its moisture; a portion would return to the earth within 30°, again to join the trade-wind, and another portion return towards the north as a part of the greater upper current.

Under the operation of Prof. Henry's law, the greater part must return to the earth between latitude 30° and say latitude 35°; the remainder would flow on towards the poles, until it met the prevailing polar northwesterly winds; at these points there would be fogs and summer rains. Wherever the polar wind forced its way south of this, it would condense the moisture of these descending trade-winds and give rain. This they would do until they had passed so far south that their temperature would be raised to that of the descending return trades, when, of course, no moisture could be precipitated. It is these polar winds, forcing themselves among the descending trade-winds, that give British Columbia, Washington Territory and northern Oregon their summer showers. Should they force themselves further south, they in their passage have to pass into warmer latitudes; they would also meet the heat of our great valleys and deserts, and become as warm as our prevailing summer wind, and therefore could not give California summer rains.

But from midsummer, the sun is for six months moving south, taking with him the great belts of the winds of the tropical, temperate and polar zones, until, at our midwinter, his rays at noon are vertical just north of the northern part of Chile in South America. These belts moving south with the sun during six months, the region of conflict between the polar wind and the variable winds, which in summer was over British Columbia, Washington Territory and Oregon, has now moved south over Oregon and the northern and middle parts of California. The temperature of the earth's surface, and the air in contact with it, have been lowered by the withdrawal of the sun's more direct rays, and the polar winds are permitted to reach further to the south without increasing their temperature. The region of calms and the southern limit of the variable winds have, of course, also moved south with the sun beyond the Tropic of Cancer. At this season, in the Pacific, the trade-wind is not usually found north of latitude 13°. When in winter the descending return trade-wind, coming from the southwest, meets the coast south of Cape St. Lucas, it is forced by the Cordilleras and the configuration of the main coast into the Gulf of California, and is deflected into a course from the southeast, or, to be more exact, as shown by the records kept by Dr. Gibbons, into a course from the south-southeast. Without doubt, the southwest trade-wind, which strikes the coast of Lower California in winter north of Cape St. Lucas, is deflected by the high mountains parallel to the shore, and also passes over our coast counties as a southeast wind. H. L. Warner, in a paper read before the American Association for the Advancement of Science, at its Baltimore meeting in 1858, was the first to note the fact, that the waters of the Gulf of California supply the moisture to the southeast wind that bears to us our rains. It may be objected that the Gulf of California has not sufficient area from whence could be delivered the great volume of southeast winds that at times, during our winters, flows over this State. The Gulf is not the cause of this wind, but it is the channel through which it flows and gives to it direction. When the sun is vertical on the coast of Bolivia, just north of Chile, at our midwinter, he has carried south with him the northeast trade-winds, until, as has been stated, they do not prevail north of about latitude 13°. The region of calms, where the great body of the upper current returns to the earth again to join the trade-winds, is at this season between latitudes 13° and 18°. North of this region of calms, at this time, those portions of the upper current which pass further north descend to the earth, under Prof. Henry's law, as southwest winds. At latitude 20°, the west coast of Mexico projects a bold headland into the Pacific ocean, known as Cape Corrientes. South of the Cape the trend of the coast for nearly 2,000 miles is east-southwest. North of this Cape, the trend for more than 100 miles to Mazatlan is north. From Mazatlan to the head of the Gulf of California, a further distance of 600 miles, it is north-northwest. The Sonora arm of the Cordilleras rises above the table land of Mexico at latitude 20°, and runs north northwest along the coast nearly to the head of the Gulf of California.

All of these southwest Winds that Strike the Coast.

From Cape Corrientes north to Cape St. Lucas, are deflected by these mountains and forced up the gulf as south-southeast winds. The United States Coast Survey have lately completed the survey of this gulf and parts of the Mexican coast, north of Cape Corrientes. When their record of observations of the course of the prevailing winds in winter, the barometric pressure and the temperature of the air and water is published, I feel confident that it will be found that the southwest return trades prevail in winter north of Cape Corrientes, and are turned by the mountains and the coast up the Gulf of California, and so over this State as our southeast winds. It comes from this gulf warm and laden with moisture and passes over the Colorado and Mohave deserts. These deserts, as shown by the meteorological records of the Smithsonian Institute, have a mean winter temperature of from 48° to 56°. This is not sufficiently low to precipitate its moisture and it passes on until it meets the Sierra Nevada and Coast Range mountains. In ascending these, it rises into cooler regions, finds a mean winter temperature of 40° and gives up some of its moisture. When it flows down into the southern end of the great valley of the Tulare, it meets a mean winter temperature of 48°, which is higher than that of the mountains it has just passed. It therefore retains its moisture and passes on, until it meets a cold polar wind and has another portion of its moisture condensed in a rain storm, or failing to meet this, passing still further north, until its moisture is condensed by the prevailing low temperature of a higher latitude. It is of frequent occurrence in winter, that a gentle southeast wind will blow for days, giving no rain south of the latitude of San Francisco, but cloudy weather at the northern end of the Sacramento valley and light showers and rains from Red Bluffs to Oregon. Therefore the northern part of the State should receive more rain than the southern and the mountains more than the valleys. The least rain should be in the hot deserts and on those sides of valleys most sheltered by mountains from the moisture-bearing winds. The first proposition that the northern part of the State should receive more rain than the southern, appears to be confirmed by the following exhibit of the

Rainfall in the Sacramento, San Joaquin and Tulare Valleys.

These, in fact, constitute one great valley. All of it has the Sierra Nevada on the east and the Coast Range mountains on the west. A line drawn through its center, in the line of the rain-bearing wind, south-southeast from Fort Reading to Sumner, would at all points be about an equal distance from the ocean and also an equal distance from the Nevada desert. All the stations relatively to their surroundings are, therefore similarly situated and general laws have full operation free from local disturbance. Commencing at the north end of the valley, the record is as follows:

Rainfall at North End of Valley of California.

Stations.	Latitude.	Longitude.	Height above ocean —feet.	Extent of series.	Annual mean of rain in inches.
Fort Reading.....	40° 30' 122° 05'	674	1852-56	20.11	
Red Bluff.....	40° 10' 122° 15'	307	1872-77	18.41	
Tehama.....	40° 122° 08'	222	1870-77	16.30	
Chico.....	39° 40' 121° 50'	193	1871-77	21.00	
Marysville.....	39° 21' 121° 30'	67	1871-77	17.46	
Sacramento.....	38° 34' 121° 28'	30	1840-77	18.75	
Stockton.....	37° 57' 121° 17'	23	1854-57 1871-77	13.23	
Modesto.....	37° 40' 120° 55'	01	1871-77	0.60	
Merced.....	37° 20' 120° 20'	171	1871-77	0.36	
Borden.....	36° 55' 120° 27'	187	1875-77	3.32	
Tulare.....	36° 14' 119° 18'	252	1875-77	4.83	
Delano.....	35° 43' 119° 12'	313	1875-77	4.03	
Sumner.....	35° 23' 118° 58'	415	1875-77	3.02	

Mountains have More Rain than Valleys.

The second proposition, that the mountains should receive more rain than the valleys, is also confirmed by the following exhibit, wherein have been selected successive stations on a line as nearly as possible east from San Francisco, thereby avoiding any increase of precipitation due to increase of latitude. The law, as stated by Guyot, deduced from experiment and observation, is that an elevation of 350 feet is sufficient to diminish the mean temperature of a given place by 1° of Fahrenheit; that is to say, the effect is the same as if the place were situated 70 miles further north.

Commencing near the center of the Sacramento valley, at the lowest elevation above the sea, the following results are shown:

Center of Sacramento Valley.

Stations.	Latitude.	Longitude.	Height above the sea—feet.	Extent of series.	Annual mean of rain in inches.
Stockton.....	37° 57'	121° 17'	23	1854-57	13.23
Sacramento.....	38° 34'	121° 28'	30	1871-77	18.75
Rodlin.....	38° 45'	121° 12'	249	1870-77	17.30
Auburn.....	38° 52'	121° 02'	1363	1870-77	20.70
Colfax.....	39° 06'	120° 55'	2421	1870-77	22.72
Alta.....	39° 12'	120° 52'	3612	1870-77	47.32
Emigrant Gap.....	39° 18'	120° 35'	5230	1870-77	51.49
Gisno.....	39° 19'	120° 28'	5539	1870-77	55.32
Summit.....	39° 20'	120° 15'	7017	1870-77	58.48

That the least rain should be in the deserts,

is confirmed by the records kept at various stations.

Commencing south and proceeding north, the following statement is shown:

Stations.	Latitude.	Longitude.	Height above Sea.	Extent of Series.	Annual mean of Rain, In.
Fort Yuma.	32° 44' 114" 36'	200 ft.	1855 to '67 1861 to '73	3.06	
Pt. Mohave.	35° 09' 114" 35'	604 ft.	1854 to '70 1863 to '73	2.05	
Wadsworth.	39° 42' 119" 15'	4077 ft.	1870 to '77	3.21	
Hot Springs	39° 51' 119" 02'	4070 ft.	1870 to '77	3.19	
Brown's	40° 00' 118" 35'	3925 ft.	1870 to '77	3.53	

The Great Deserts.

Fort Yuma and Mohave, on the Colorado and Mohave deserts, are in the zone where the great body of the descending southwest return trade-winds reach the earth. It has been shown that these descending currents cannot give rain, as, in falling, they continuously arrive at regions of increasing temperature. It is therefore in this zone, on both sides of the equator, that almost all the great deserts of the earth are situated, and primarily to this cause is their existence due. The Mohave and Colorado deserts are in the same latitudes north of the equator as the deserts of Sahara and Arabia. The great desert of the interior of Australia is in the same latitude south of the equator as the desert of Atacama in South America.

The stations of Wadsworth, Hot Springs and Brown's in the above table are in Nevada and in the region of variable winds, and are made desert by want of rain; but better illustrate the last proposition, that less rain should fall on the opposite side of mountains to that exposed to the moisture-bearing winds.

Rainfall on Mountain Sides.

For further illustration of the proposition: I have selected stations in different parts of this State and Nevada. *Fort Tejon*, latitude 34° 53' north; longitude, 118° 53' west, on the south side of the Tehachapi mountains, were the Sierra Nevada and Coast range unite, forming a wall against the southeast wind, has an elevation of 3,240 feet. From a record of five years, it has an annual mean of 19.53 inches of rain. *Caliente*, a station of the Southern Pacific railroad 30 miles northeast, elevation 1,290 feet upon the north side of this range, from a record of two years, has but an annual mean of 6.38 inches; and *Sumner*, 31 miles north of Tejon, with an elevation of 415 feet, receives but 3.92 inches. The Tehachapi mountains precipitate some of the moisture from the southeast winds and under the law as stated by Guyot, they descend into the valley dry and cloudless. The *Summit of Mount Diablo*—elevation 3,856 feet—from a record of two years, receives an annual mean of 20.85 inches. *Livermore*—in one of its valleys—elevation 485 feet, from a record of six years, has an annual mean of 13.28 inches; while *Ellis*, at its northeastern base, with an elevation of 76 feet, from a record of six years, receives but an annual mean of 9.22 inches. *Benicia*, at its northwestern base, elevation 64 feet, from a record of 13 years, receives an annual mean of 13.7 inches. This increase at Benicia shows an interference with the law which, I think, may be explained by the indraft of air into San Pablo bay from the Bay of San Francisco through the narrow channel, on the bank of which Benicia is situated. Gen. Myer, Chief of the Signal Service, in his circular on the practical use of meteorological reports, says: "That wind which in the ocean would blow with a certain velocity will have but one-half or one-third of that velocity, when blowing over a hilly country." While *Diablo* robs Benicia of its rain, it is, in part, compensated from the currents of moisture-laden air that flow up the Straits of Carquinez, in consequence of meeting with less resistance. The *Summit of the Sierra Nevada* where it is crossed by the railroad, as has been shown, receives an annual mean of 58.48 inches. *Boca*, 13 miles northeast in an air-line, but 1,484 feet below, on the eastern flank, for the same number of years, receives but an annual mean of 14.58 inches; and *Reno*, 31 miles in an air-line in the same direction, and 1,510 feet below the summit, and nearer the eastern base of this range of mountains, receives for the same time but an annual mean of 4.78 inches. There are two stations, one on each side of the Sierra Nevada, whose elevations above the sea are nearly the same—*Alta*, on the southwestern side, and *Brown's* on the northeastern. The first has an elevation above the sea of 3,612 feet, the latter of 3,925 feet. *Alta* received during a record of seven years an annual mean of 47.32 inches, and *Brown's* for the same period 3.53 inches.

Moisture-Bearing Winds.

Dr. Henry Gibbons has shown from his daily record of the climate of San Francisco, that whatever course the wind may have near the surface of the earth at this place, the upper currents of air, whenever their clouds could be seen, were moving from the southwest. The records of the station at the summit of the Sierra show the same fact. It is not uncommon that the Sacramento valley is filled with a southeast wind, it may be giving rain, while a cloud bearing southwest wind is blowing at the summit. When this southeast wind becomes a storm, it flows up the canyons, ravines, gulches and river courses as a southwest wind and joins this upper current, for the general course of all the ravines and river courses of the Sierra is from the northeast to the southwest, and the wind, like other fluids, takes the

course of least resistance. It is believed that an early fall of snow in the Sierra increases the rainfall in the Sacramento valley. There is not yet sufficient data to hazard a positive conclusion on the subject. All the moisture-bearing winds pass from the valley over this snow into the great basin of Nevada, therefore, an early fall of snow storing up a cold temperature would probably increase the subsequent fall on the Sierra. If it shall be found to increase the rainfall in the valley, the cause can be ascribed to the fact, that the belt of snow is a store-house of cold, lowering the temperature of the adjacent air, which, by increase of weight, flows down into the valley and lowers the temperature of the air at the lowest places in the valley. Tulare, near the shore of Tulare lake, which is the lowest point of that portion of the valley (the town being 282 feet above the sea), is at the base of the highest mountains in California. The cold air flowing down from these mountains reduces its winter temperature (December, January and February) to a mean of 45.57°, while Auburn, 158 miles further north, and with 1,087 feet greater elevation, situated on the long spur jutting into the valley which the railroad climbs to cross the mountains, for the same months, has a mean temperature of 46.70°, the mean of the winter at Tulare being more than one degree colder than at Auburn. Chico, 206 miles north of Tulare, and eighty-nine feet less in elevation, has a winter climate one and a quarter degrees warmer than Tulare, its mean winter temperature being 46.82°.

If it were not for the cold air from the mountains flowing to the lowest places in the valley, Tulare would be entitled to a winter temperature of 51° warmer than that of Auburn, two being due to decrease in latitude, and three and a half to decrease in elevation.

The coast counties are controlled by the same general laws that govern other parts of the State. There is more rain north than south, more on the hills than in the valleys, more on the south side of the hills than on their northern and eastern exposures. Their proximity to the ocean gives them a more even temperature than in the interior, making them cooler in summer and warmer in winter. From the sea coast to the summits of the Coast range of mountains, they are also subject to the

Influence of the Japan Gulf Stream.

This stream, according to Prof. Davidson, in the "Alaska Coast Pilot," "starting with a maximum temperature of 88° sweeps across the Pacific and about latitude 45° to 50° in longitude 148° divides. The main body stretches directly towards the coast of America, is deflected southward and eastward and runs down the coast of Oregon and California. A branch of this current continues direct to the Alexander archipelago, and striking the southern part of the coast, deflected to the northward and westward. It is the warm Alaska branch which causes the high isothermal lines that exist directly on the Alaska coast." The temperature of this Alaska branch, as observed by him in September, 1876, was from 50.06° to 47.01°, decreasing irregularly. The prevailing westerly winds of those latitudes, warmed by this gulf stream take from it moisture which is condensed into fog and precipitated in rain upon the coast, when they meet its glacial mountains and the cold air and water flowing down from them. The influence of this current in producing summer rains extends as far south as the Columbia river; the meteorological records of the Smithsonian Institute showing that, at the mouth of this river, there is a mean for the summer of six inches of rain, and an annual mean of 78 inches. At Sitka, as shown by the "Alaska Coast Pilot" from a record kept from 1847 to 1854 and from 1855 to 1864, the annual means is 82.66 inches. For the purpose of ascertaining the

Effect on our Climate

Of that branch of this gulf stream where it passes down our coast, I procured from Capt. Bradbury, the logs of 24 voyages of the Occidental and Oriental Co.'s steamers between San Francisco and Yokohama. These voyages were between November 16th, 1875, and December 26th, 1876. From these I have gathered the temperature of the air and water taken at noon for a distance of 900 miles west from San Francisco, and the temperature of the water for the same distance east from Yokohama. Yokohama and San Francisco being very nearly in the same latitude. These distances were selected on each side the ocean, because there is no marked increase or decrease in temperature either near San Francisco or Yokohama until these distances have been passed. There has also been gathered the temperature of the water in mid-ocean between these two ports; one series for each month at about latitude 42° and longitude 180°; and one series for each month at about latitude 32°, and longitude 180°. The steamers coming from Yokohama to San Francisco usually going north to 42°, and the steamer from San Francisco to Yokohama going south to 32°. The mean temperature of the water for a distance of 900 miles east of Yokohama for the year was 65.40°. The mean of the warmest temperature of the water for the year, was 65.16°. The mean of the coldest was 60.37°. The warmest on any day was September 7th, 1876—750 miles east of Yokohama, when it was 84°. The coldest was January 14th, 1876, at the same distance, when it was 49°. The means of the air and water, for each month, for a year for a distance of 900 miles west of San Francisco, are, as follows:

DEWEY & CO.

American & Foreign Patent Agents

OFFICE, 202 SANSOME ST., N. E. COR. PINE, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) sooner than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free

Home Counsel.

Our long experience in obtaining patents for inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

DEWEY & CO.

United States and Foreign Patent Agents, publishers Mining and Scientific Press and the Pacific Rural Press, 202 Sansome St., N. E. corner Pine, S. F.

Scientific and Practical Books

on Mining, Metallurgy, Etc.

Published or issued wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST

Roasting of Gold and Silver Ores, and the Extraction of their respective Metals without Quick Silver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and contains full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.

Price, \$2.50 coin, or \$3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, \$7.50

Testing and Working Silver Ores.

The above is the title of an illustrated work of 114 pages, for miners and prospectors, by Chas. H. Aaron, which has just been issued by Dewey & Co. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope:

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working same, appliances for testing, roasting, etc. Under the head of "Working Ores" the author describes Aaron's process, has something to say of superheated steam, preparation of dichloride of copper and protochloride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amalgam, Patchen's process, etc. He also describes the methods of working roasted ores, treatment of base metals, stirring, heat of furnace, want of sulphur, etc. Under the head of "Leaching Processes" are the titles: Smelting, Mexican process, Chilean process, Kroschke's process, etc. Under "Pulverizing Machines" are described the arastra and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Noice's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, grinding the ore, directions for making a barrel, preventing mechanical wear, use of quicksilver, copper in bars, Freiberg barrel, cheap barrel trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improvised retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous mention may be found Aaron's leaching apparatus, with two or three different arrangements, a small mill, sampling tailings and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

The book is a serviceable one for miners and prospectors' use. Price, post free, \$2.00. Address Dewey & Co., MINING AND SCIENTIFIC PRESS, 202 Sansome Street, San Francisco.

Contents of Pamphlet on Public Lands of California, U. S. Land Laws, Map of California and Nevada, Etc.

Map of California and Nevada; The Public Lands; The Land Districts; Table of Rainfall in California; Counties and their Products; Statistics of the State at Large.

Instructions of the U. S. Land Commissioners.—Different Classes of Public Lands; How Lands may be Acquired; Fees of Land Office at Location; Agricultural College Scrip; Pre-emption; Extending the Homestead Privilege; But One Homestead Allowed; Proof of Actual Settlement Necessary; Adjoining Farm Homesteads; Lands for Soldiers and Sailors; Lands for Indians; Fees of Land Office and Commissioners; Laws to Promote Timber Culture; Concerning Appeals; Returns of the Register and Receiver; Concerning Mining Claims; Second Pre-emption Benefit.

Abstract from the U. S. Statutes.—The Law Concerning Pre-emption; Concerning Homesteads; Amendment Act Concerning Timber; Miscellaneous Provisions; Additional Surveys; Land for Pre-emption; List of California Post Offices. Price, post paid, 50 cts.

Published and sold by DEWEY & CO., S. F.

OUR AGENTS.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. L. THARP—San Francisco.

B. W. CROWLEY—California.

C. KNOX—Pacific Coast.

C. N. WEST—Santa Cruz, Monterey and San Benito counties.

A. C. CHAMPION—Tulare, Fresno and Inyo counties.

EDWARD S. BAKER—Australian Colonies and Sandwich Islands.

W. D. WHITE—San Bernardino and Los Angeles counties.

J. W. A. WRIGHT—Sacramento, Placer and San Joaquin counties.

B. E. LLOYD—Alameda, Contra Costa and Napa counties.

E. M. DENNY, Oregon.

F. B. ANDERSON, Nevada.

H. E. HALL—San Joaquin, Yolo, Yuba, Sutter and Colusa counties.

THE EXPLORERS', MINERS' AND METALLURGISTS' COMPANION.—Comprising a practical exposition of the various departments of exploration, mining, engineering, assaying and metallurgy; containing 972 pages and 33 engravings. By J. S. Phillips, M. E. Price—cloth, \$10.50; in leather, \$12; postage 50 cents. Sold at this office.

TWENTY-FIFTH YEAR 1878.

Hall's Journal of Health.

Contents of a Single Number:

The Little Courtships of Life; Coughing in Consumption; Influence of Christianity on Medical Science; Languor and Ill Health; Rage and Ruin; Kindness the Best Punishment; Grass in Rum; Valuable Table; Incurable Insanity; Consumption A Suggestion; The Spirit Rapper; Premium on Rabies; Our Proverbia; Wrecked Clergymen; Marrying Well; The Lifting Cure; Sea Sickness; Face Painting; A Filthy Atmosphere; The Latest Crazy Man; A Suggestion; The Erie Railway; Sick Children.

Published in New York. E. H. Ginn, M. D., Editor.

This Journal has maintained the highest record of any health journal issued in the English language. It is not the amount of matter published which makes it the most valuable journal, but the plain and condensed truths it furnishes concerning that which is of ever vital importance to its large list of readers.

Annual subscription (post-paid).....\$1.50.

To subscribers of this paper.....75 cents.

UNITED STATES

Mineral Land Laws, Revised Statutes,

AND INSTRUCTIONS AND FORMS

UNDER THE SAME.

We have just issued a pamphlet containing the General Mineral Land Laws of the United States, with instructions of the Commissioner of the Land Office. The contents of this pamphlet comprise all of the Government laws with relation to mineral lands of interest to the mining community, as follows: Mining Statute of May 10th, 1872, with instructions by the Commissioner of the Land Office; Mining Statute of July 26th, 1806; Mining Statute of July 9th, 1870. Forms required under Mining Act of May 10th, 1872, as follows: Notice of Location; Request for Survey; Application for Patent; Proof of Posting Notice and Diagram of the Claim; Proof that Plat and Notice remained Posted on Claim during Time of Publication; Registers' Certificate of Posting Notice for Sixty Days; Agreement of Publisher; Proof of Publication; Affidavit of \$500 Improvements; Statement and Charge of Fees; Proof of Ownership and Possession in Case of Loss or absence of Mining Record; Affidavit of Citizenship; Certificate that no Suit is Pending; Power of Attorney; Protest and Adverse Claim; Non-Mineral Affidavit; Proof that no Known Veins Exist in a Placer Claim, etc. There is also given the U. S. Coal Land Law and Regulations thereunder. The work comprises thirty pages, and will be sold, post-free, for 50 cents. It should be in the hands of every one having any mining interests. DEWEY & CO., Publishers of the MINING AND SCIENTIFIC PRESS, S. F.

Questions of the Times.

Which are the most reliable watches?

American watches, they are driving those of foreign make out of the market.

Which is the best American watch?

The Hampden watch, made at Springfield, Mass.

Why is it the best watch?

Because it is substantial in all its parts, constructed on the best principles and embodies those improvements which experience has shown to be most desirable.

Why is the Hampden watch so popular?

Because in buying one you are sure of getting a good time-keeper. While purchasing a watch of most other makes is like investing in a lottery—a great many blanks to one prize.

Which is the cheapest watch?

The most economical is the Hampden watch. For you can get one of these excellent time-keepers for less than it costs in a short time to patch up a poor watch, which benefits no one but the repairer.

Where can I get a Hampden watch?

By addressing the long established, practical watch-makers and jewelers, DEWEY & JOHNSON, 433 Montgomery St., San Francisco, who will send you a descriptive price list, including the following styles of movements: "John Hancock," "Geo. Sam. Rice," "Chas. E. Hayward," "Aaron Bagg," "Theo. E. Studley," "Chester Wolworth," "Frederick Billings," "Railway," "John L. King," "E. W. Bond."

TO QUERISTS.

In propounding questions to the editorial, patent or business departments of this office, letter writers should be careful to enclose a stamp and addressed envelope if they wish prompt answer. If we were to furnish time, paper, envelopes and stamps, ALL free to parties who address this office on matters of mere interest to themselves that to us, FIVE HUNDRED DOLLARS A YEAR would not cover the expense. This hint, however, is not intended for parties writing in our own or the public interest, or who would be obliged to delay writing at any time for want of an extra stamp.

Thanks for Six Patents, Etc.

SACRAMENTO CITY, November 28, 1877.

MESSES. DEWEY & CO.—Dear Sir:—Please accept my thanks for the prompt and successful manner with which you have conducted my business in obtaining patents for fire brick, and for a smelting and condensing furnace, making six patents I have obtained through your patent agency. Four of the above patents were for the purpose of saving fine gold, quicksilver and amalgam, and the concentration of ores of all kinds. I can cheerfully recommend the firm to all with whom I may come in contact, especially inventors. I remain, respectfully yours, GEO. R. EVANS.

EVERY new subscriber who does not receive the paper and every old subscriber not credited on the label within two weeks after paying for this paper, should write personally to the publishers without delay, to secure proper credit. This is necessary to protect us and the subscribers against the acts and mistakes of others.

Among the advantages gained by this holder are the following:

It can be opened and closed quickly. The points are less obstructed while the articles to be filed are being placed.

The papers (wholly or partly folded) can be either "straddled" over the lower bar, or filed in regular book order.

The elastic hinge and band accommodate and hold firm either a large or small number of papers.

With less material, it is lighter and less cumbersome than other holders, and approaches nearer to bookbinding. It has no rigid hooks, hinges or loose parts to break or get lost.

It has proved durable in practice. The file is adjusted but 52 times a year for a weekly paper, and a sample holder can be opened and closed 1,000 times without showing wear.

Five sizes are made to suit the dimensions of different papers, viz.: 18, 22, 26, 30 and 34 inches, inside measure. Single samples will be mailed from office for 50 cents, (and upward, according to size), postpaid. Wholesale and retail agents wanted.

Mining and Scientific Press

Is the leading mining journal in America, and enjoys a large circulation among the more intelligent operators and workers in the gold fields of the world.

As a scientific and mechanical representative of the Pacific Coast, it is decidedly popular and a standard journal with the most thrifty industrial people of the Pacific States and Territories. Its authority is of the highest order, and its usefulness in its special sphere unrivaled.

Every public library, mining engineer, metallurgist, mining operator and intelligent mechanic and manufacturer will find profit by its reading.

Subscription, \$4 a year in advance. Sample copies, post paid, 10 cents.

DEWEY & CO., Publishers, S. F.

PROMPT AND SUCCESSFUL.—Messrs. Dewey & Co.—Gentlemen: Your Circular letter, 12th inst., informing me of successful termination of my application for patent received. Please accept thanks for the prompt and successful manner in which you have managed this business. Yours respectfully, J. H. CAVANAUGH.

Walla Walla, Dec. 24th.

Buy the Best.

Before purchasing an American Watch, examine the different styles manufactured by the HAMPDEN WATCH COMPANY, at Springfield, Mass. They are the latest and best improved manufacture. You can depend upon them for fine finish, durability and perfect time. They are sold at favorable prices—in fact, no higher than many of the inferior styles. Examine into the merits of this Watch before you buy any other. Our word for it, you will not regret it.

DEWEY & JORDAN, Agents,
433 Montgomery St., S. F.**Peerless Corn Sheller.**

It is so cheap (costing only \$6), that almost any one can afford to buy one. It is so rapid, it will shell almost as fast as a \$40 machine, and seven or eight bushels per hour is not above its capacity. It weighs only 13 pounds and is simple and durable. For particulars, address

THE O'HARRA CHLORIDIZING FURNACE

Guaranteed to Chloridize from 85 to 95 per cent. of any gold or silver ores that are not more profitable for smelting. Will also desulphurize ores and put them in proper shape for working in cupola furnaces.

Cost of Roasting and Chloridizing 20 Tons in 24 Hours by this Process:

One man.....	\$ 4 00
One man.....	3 00
Wood—2½ Cords at \$3 per cord.....	5 25
Salt—1,600 lbs at 2½ cents.....	40 00
Cost of 20 tons.....	\$52 25
Cost of one ton.....	2 61½

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

The furnace is now working successfully at the Poe Cou solidated Co.'s mines, in Peavine District, Nev., and at the Exchequer mill, Alpine Co., Cal. For further information, apply to

THE ILLUSTRATED

National Pronouncing Dictionary

—OF THE—

ENGLISH LANGUAGE.

Orthography, and Pronunciation according to the best English authorities, with an appendix containing abbreviations, foreign words, phrases, and forms of address. TWO HUNDRED AND FIFTY ENGRAVINGS.

The design of an English Pronouncing Dictionary is to exhibit the pronunciation of the language as it is current in educated society. It must be admitted that of all the expedients which have been devised to serve this important end, the phonetic is by far the simplest and most effective. The orthoepical department of this dictionary is, therefore, phonetical. The usual orthography of every word is re-spelt in such a way as to show at once how it ought to be pronounced. By means of this mode of spelling, combined with proper accentuation and syllabication, a correct pronunciation is exhibited without confusing the eye or perplexing the memory, with a long array of orthoepical notation—an advantage of the utmost importance in any dictionary.

The generally accepted orthography of the language is maintained throughout the work, and the definitions are sufficiently numerous for all ordinary requirements. The illustrative engraving—an entirely new feature in a school dictionary—will greatly aid the pupil in understanding the given definitions.

On the whole, it is not too much to say, that this dictionary meets a great requirement of the age. By reason of the completeness of its component parts, the compactness of its form, and the lowness of its price, it is sure to command a very extensive circulation wherever the English language is spoken.

The Latest and Most Complete Manual.

THIRD EDITION OF

Skidmore's Mining Statutes,

WITH INSTRUCTIONS, DIGEST OF JUDICIAL AND

DEPARTMENTAL DECISIONS, RULES OF PRACTICE, FORMS FOR SECURING AND CONVEYING TITLE, SPECIAL STATUTES,

AND INDEX.

We have no hesitation in announcing Mr. Skidmore's popular work, as revised and enlarged, the most complete, reliable, and useful Manual of Mineral Law extant. It contains many features not found in other works, such as the Rules of Practice established by the Department of the Interior, the Coal and Saline Acts, the Timber Regulations, and Digest of the most recent and Important Judicial Decisions. The ordinary Forms of Incorporation and Conveyancing of Mining Claims in use in California have been added, and a full Index renders the various matters easy of reference.

The Digest gives the dates of the decisions and reference to the periodicals and works in which they may be found, and the introduction of index words and phrases in capitals and bold-faced letters renders it easy to find at once the particular information needed.

Mr. Skidmore's Commentaries is a more elaborate work, a treatise for the lawyer, but even to those of the legal profession who have that work, this will be a convenient and valuable hand-book.

Mr. Skidmore seems determined to retain the enviable reputation established for his work as the most complete and reliable

Manual of Mining Law.

It is beautifully printed upon the best paper; contains 140 clearly and closely printed octavo pages, and is published at the low prices of \$1 in pamphlet and \$1.50 in law sheep binding.

Mailed, post-paid on receipt of price.

FINE RANCH FOR SALE.

PRICE, \$8,000.

The ranch is situated on the direct stage road between Mendocino City and Cloverdale, in Mendocino County. Forty miles from Cloverdale, 20 miles from Navarro Ridge and one mile from the Christine Postoffice.

It Consists of a Total of 2,000 Acres,

Of which 640 are secured by Government title and the balance by possessory title. It consists of

150 Acres of Rich Bottom Land,

Which is adapted to the raising of Wheat, Barley, Oats, Potatoes, Corn, Vegetables, etc., and will raise as large crops as any land in the county. There is 1,210 acres of Fine Rolling Land which is a No. 1 pasture land, and capable of keeping 1,000 head of Sheep, or 100 Dairy Cows. The whole ranch is well fenced with picket and post and rail fence, and has eight good buildings on it, consisting of a good substantial and comfortable

Dwelling House of Six Rooms.

Two Barns, one of them 100x40 feet, and the other 40x40 feet, a Granary, Woodshed, Chicken House, and a No. 1 Dairy House, new last year. There is a bounteous and never failing supply of good soft water at both the Dwelling and Dairy Houses.

On the ranch is a large quantity of Redwood timber, suitable for all purposes. There is a

Fine Orchard of Some 300 Trees,

Of the choicest varieties of Peach, Apple, Pear and Plum, as well as a large quantity of Grapevines, Currant and Gooseberry bushes, and other small fruit. There is 100 acres sown to Wheat and Barley, which is now up four or five inches, and promises an abundant harvest in the fall.

The owner has also about 40 head of Cattle, a few Sheep, five horses, 150 head of hogs, 100 Hens, and a large supply of all necessary Farming Utensils, which he will dispose of to the purchaser at very reasonable terms if desired.

The neighborhood is as good as could be desired, only one mile from a store and one-half mile to a good schoolhouse, as well as one-half mile from a church.

The owner's reasons for selling are his wife's health and his dislike of the business. At the price at which it is offered it is the cheapest ranch in Mendocino County, as the crop bids fair to be worth when harvested, \$4,000.

For Terms are \$3,000, one-half cash and the balance secured by a mortgage at one per cent. For full information, address

THE CLIMATE OF CALIFORNIA.

A thoroughly studied and ably written treatise on this subject by Hon. B. B. Redding, appears complete in the Pacific Rural Press for January 26th, and also the MEXICO AND SCIENTIFIC PRESS. Based upon facts, figures and careful and extensive observations made in various parts of the State on this important subject, it is a volume of reliable information, interesting to every resident of the State. The information is condensed in a paper read before the California Academy of Sciences, and is published in the Press as read before that Society without any alterations or omissions. Extra copies, post-paid, 10 cents. Address DEWEY & CO., Publishers, 202 Sansome Street, San Francisco.

PACIFIC MAIL STEAMSHIP CO.

The Company's Steamers will sail as follows, at 12 M.:

CITY OF TOKIO.....February 5th.

For YOKOHAMA and HONGKONG.

GRANADA.....February 5th.

For PANAMA and New York, calling at Acapulco, Mazatlan and Manzanillo.

Tickets to and from Europe by any line for sale at the lowest rates.

SOUTH CAROLINA.....February 8th.

For PANAMA, calling at Acapulco and all ports south of Acapulco.

AUSTRALIA.....February 18th at 12 o'clock, noon

or on arrival of the English Mails, for HONOLULU, AUCKLAND and SYDNEY.

\$10 additional is charged for passage in Upper Saloon.

DAKOTA.....January 30th.

For Victoria, Port Townsend, Seattle, and Tacoma, connecting at Tacoma with Northern Pacific Railroad for Portland, Oregon.

Tickets must be purchased before 11 A. M. on day of sailing.

For freight or passage apply at the office corner First and Brannan streets.

An Important Improvement in Ice Manufacture.

A San Francisco Invention.

There seems to be no finality in science or in scientific mechanism. One improver comes after another in such swift succession, that each improver soon finds himself improved. A few years ago, the production of ice by artificial means was considered something quite wonderful, even taking into account the great cost attendant upon the earlier efforts. But by successive discoveries and improvements, the cost of the artificial production of ice has been greatly diminished, and the simplicity of the process so wonderfully advanced, that within the past year or two art has fairly superseded nature, even in the most favored localities, like New York, where the Ice King holds undisputed sway over river, and pond, and lake, for full one quarter of the year. To give some idea of the economic progress which has been made in this direction, it may be remarked that fifteen years ago, it cost nearly or quite \$20 to produce one ton of artificial ice; ten years ago the cost had been reduced more than one half, since which time the cost has been reduced from time to time, by added improvements, until by the machine herein described, pure crystal ice can be made at a cost not to exceed one dollar per ton.

For a century or more, the great problem has been to convert heat into power at the cheapest cost—as by the steam engine. The progress in this direction has been very slow and unsatisfactory. Much better success has been achieved in the solution of the later problem of converting power into cold by the ice machine.

The Latest Improvement.

However, and the one which entirely distances all others, is of quite a recent date, at least in its practical demonstration, and has been made in our own city of San Francisco, by Mr. J. F. Gesner, who has recently come hither from New York for the special purpose of putting into actual use a discovery which he conceived some three or four years ago in his little laboratory in the last named city. This improvement consists mainly in the employment and in the adaptability of machines for the employment, as a refrigerating agent, of

An Entirely new Fluid.

One scarcely known at all out of the laboratory of a fine chemist, and one never before employed as a refrigerating agent. The advantages of this fluid are manifold, some of which may be enumerated as follows:

1st. It is non-explosive, entirely safe and quite pleasant to the sense of smell.

2d. It is anti-corrosive, having no action, whatever, on any of the metals.

3d. Its condensing and evaporating points come nearer together than those of any other fluid known, an advantage which is readily appreciable to any expert in the manufacture of ice.

4th. It is exceedingly volatile and mobile, especially when placed under the action of the air pump.

5th. This last quality is, perhaps, its most important one, and is so perfect that while the ethers and the various lighter products distilled from petroleum, now in quite general use, as well as sulphurous oxide, compressed air, etc., have to be used in connection with a non-congealing liquid such as salt and water to intervene as a carrier or conveyer away of the heat from the water, this new liquid acts as its own carrier, and may be used in direct contact with the walls of the vessel containing the water to be frozen. This quality greatly simplifies and reduces the weight and bulk of the machine, and the whole process of artificial ice manufacture.

6th. This fluid condenses under from five to ten pounds pressure, while ammonia requires from 80 to 120 pounds, and the various other fluids in use vary from 40 to 50 and upwards all the way to the condensing point of ammonia.

7th. By reason of the low condensing point of the Gesner fluid there is great economy in the amount of power required over any other, while the machine itself may be constructed of lighter materials, as well as made lighter in weight. For the same reason there is less liability of leakage in the joints. In fact every joint

used in the Gesner machine may be held securely by ordinary soldering—a method which gives the cheapest as well as the tightest possible joint. Another advantage of a low condensing point is the less liability to leakage of the pump, around the piston of which, and from the high pressure required to condense other fluids, there is always much loss.

8th. The low condensing point of this fluid admits of its ready use in warm climates when other machines are either utterly impracticable or attended with great expense, especially in the use of power. It is not doubted but that one of these machines could be made to operate even in the lower levels of the Comstock mines, where the thermometer stands constantly at 120° Fahr. or even higher.

It would be useless to further enumerate the advantages derivable from the use of this new fluid in the manufacture of ice. Suffice it to say that the discovery of its application marks the most important era in the progress of ice manufacture, since the first introduction of a regular ice machine by Carre, some thirty years ago.

In order to give our readers some idea of the

condensed liquid collected in the condenser to the freezers; *L*, the pipe conveying the condensed freezing liquid from the self-acting valve to the freezing cells. These cells are fed at the bottom, as shown. *N*, the vacuum gauge; *O*, the pressure gauge; *P*, the driving pulley. In operation the water tank, *A*, is closed by a removable water-tight door in front, not shown in the engraving.

How Artificial Ice is Made.

For the benefit of such of our readers as may not be familiar with the theory and practice of artificial ice making, we will try to describe it. Ice is water deprived of a certain measure of heat. Now, if by artificial means we can take away that measure of heat from the water, we have ice. Put any very volatile fluid, such as ether or ammonia, in your hand and you will feel a strong sensation of cold, produced by the rapid evaporation of the fluid from the warmth of the hand—that is the heat is extracted from the hand by means of the evaporation which takes place. The quicker the evaporation, the more intense the cold. If now, the hand could be placed in a closed vessel and the air pumped

again converted into vapor, and so continue its regular round.

The process, as will thus be seen, is exceedingly simple, and all the more effective because the refrigerating effect is applied direct to the water, through the thin metallic walls of the containing cells. No other liquid known, than the one here used, will do its work in the manner described. All other liquids except this, require the intervention of a non-congealing liquid, such as salt and water, or glycerine and water, etc., which must be provided for by extra machinery, and at a considerable loss of power and refrigerating effect.

We are pleased to state that a company has already been organized in this city to build and operate one of these machines here. The cost of one with a capacity for making 50 tons of ice per day, including the right, to use for a corresponding amount of territory, would be about \$50,000, including steam engine.

A small machine, merely to demonstrate the principle, has been in operation for several months at Klemm's Lounge Factory, on Brannan street, between 5th and 6th, where it has been examined by a great number of our citizens, who are curious or interested in such matters.

For Refrigerating Purposes.

This machine, or rather this fluid employed in a very simple manner—a modification of the ice machine—is most admirably adapted for cooling purposes, for cars, breweries, cooling houses for fruit or meat, for skating rinks, etc. For refrigerating cars, its lightness and simplicity render it peculiarly applicable. It may be employed for a single car or for an entire train. There is no method known by which the same degree of cooling effect can be produced in so compact a space, with so little weight or such small expenditure of power as in the use of one of these machines. Arrangements are now being made for the construction of a large skating rink, cooling house, etc.

Ice has now passed out of the category of luxuries to take its place among the necessities of life, and the natural supply being so uncertain and difficult of attainment to the great masses of our population, we hail with pleasure this new improvement for producing it more cheaply, and all the more because it is placed to the credit of the already long list of valuable California inventions. Letters patent for this invention have already been obtained through the MINING AND SCIENTIFIC PRESS Patent Agency, and other patents are now pending. Any further information in relation to the above may be obtained by communication with this office.

NEW DIGGINGS.—And now comes Santa Monica, Los Angeles county, with a great excitement, which we hope will pan out better than those of most of the southern counties of the State, but have our doubts. A dispatch from there dated the 29th ult. says: Considerable interest is being felt here in a report quietly circulated that gold has been found in the hills near by, under circumstances that promise material results. A nugget of sufficient size was found to induce further exploration, which has developed gold in paying quantities. The prospectors are reticent as to their location, but enough has leaked out to set the people on anxious inquiry. An expert of undoubted reliability has declared the fact that gold in paying quantities exists here between Point Dume and Santa Monica.

THE BELCHER.—At the annual meeting of the Belcher mining company this week the following trustees were elected without opposition: James Newlands, A. K. P. Harmon, J. D. Fry, R. F. Morrow and J. H. Dobinson. James Newlands was elected President, John Crockett, Secretary, and H. N. Smith, Superintendent. The financial statement of the mine is briefly as follows: The mine was in debt at the last annual meeting, \$88,000. Since then it has produced \$414,000 in bullion, \$407,000 from assessments, and \$77,000 was paid to it by Crown Point on joint shaft account. The disbursements have been all the above, or \$986,000, and \$48,000 besides, the last sum being the amount the company is in debt now to the Bank of California.

A MINER named Wm. Callicoat was killed on Friday last by falling down the pump compartment of the main shaft of the Gould & Curry mine.

GESNER'S ICE MAKING APPARATUS.

simplicity of this machine, we have prepared the accompanying illustration. The simplicity of this machine over any other ever before constructed will be at once apparent to every one at all acquainted with the different machines for manufacturing ice. While it may be worked on the largest possible scale, it is also peculiarly adapted, from its simplicity of construction, for operation on a small scale of from one to three or four tons per day or less.

By reference to the engraving, the arrangement of the machine will be understood. *A*, water-tank in which the ice is made; *B*, ice in process of formation; *D*, the freezers or cells in which the freezing liquid is placed, and against which the ice is formed; *C*, water; *F*, condenser filled with water, through which a coil of pipe passes from *H* to *K*, and in which the freezing liquid is condensed; a larger coil may be used with a spray, if desirable; *M*, the gas chamber, which is connected with all the freezing cells; *G*, the pipe connecting the gas chamber with the vacuum side of the pump and through which the gas is drawn off for condensation; *E*, the pump, double-acting; *H*, the pipe connecting the condensing side of the pump with the condensing pipe coiled in the tank *F*; *K*, a self-acting valve which passes the

out of the same. the ether would evaporate much more rapidly, and the hand would be frozen. If a cup half full of water be placed in a vessel and another cup filled with ether be placed within the cup of water, the two placed under the receiver of an air pump and the air pumped out, the evaporation is so rapid that the water is quickly converted into ice.

This is precisely the principle of artificial ice manufacture. In the machine herewith shown, the cells *D*, *D*, *D*, are partly filled with the highly volatile fluid described, and the air pump, *E*, is put in motion to remove the air and vapor from the cells. The rapid evaporation thus produced causes the water in contact with the outside of the cells to freeze, as shown at *B*. The ice gradually accumulates until it reaches the desired thickness, when by a simple device the ice is separated from the walls of the cells, slid out of the tank and cut up into blocks suitable for the market. As the vapor is pumped out through the pipe, *G*, the pump being double-acting, it is forced, under pressure, through pipe, *H*, into the coil not shown, but placed within the tank, *F*. Here the pressure reduces the vapor again to its liquid condition, when it passes on, automatically, through the valve, *K*, and pipe, *L*, into the bottom of the cells *D*, *D*, *D*, as shown, to be

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents—Eds.

The Eclipse Mining Company.

EDITORS PRESS:—Will you do me the favor of publishing the following in answer to a statement made at the last meeting of the Eclipse gold mining company, as reported in the London Mining Journal of December 22d, 1877. The statement is mischievous, and if uncontradicted is very likely to prove injurious:

The Eclipse mine, as of course you know, is in Inyo county, California, and is a most valuable property. Mismanagement and carelessness on the part of the home directors have resulted in the collapse, for which I, being several thousand miles away, am made the scapegoat. Two facts in reply to the imputations of incompetency and dilatoriness.

From April to August of last year I kept the mine constantly running under the burden of law suits, attachments, labor troubles and want of funds. Statement after statement of how matters stood was forwarded to the home office, to none of which I received a reply. Everything went on from bad to worse until, despairing of relief, and literally unable to obtain credit, I saw the Sheriff in possession and was compelled to leave for San Francisco. Even here I have heard nothing from headquarters, and it was only from the chance remark of a third party that I learned of the reported liquidation. In the second place, I have simply to say that statements were forwarded to Finsbury Circus regularly as possible under the existing circumstances at the time, and have since then kept them informed of vital matters relating to the mine, etc.

The foregoing is in answer more particularly to that portion of the Secretary's report, as copied in the journal referred to above, of which I extract the following:

"Mr. Nelson who had been sent out had proved of no service whatever, and he (the Secretary) had never been able to obtain any information from him relative to the accounts."

In conclusion I would add that if English capital invested as this had been, if properly managed by the officials at headquarters, shareholders would have obtained ample returns for their money invested and the blame of non-success is attributable to them (Directors) and not to their representatives on this side of the Atlantic. Although still these representatives here can but say that every assistance has been offered for their welfare, but they have not thought it worth while to avail themselves or appreciate the same.

C. S. NELSON.

Eclipse G. M. & Q. Co., Inyo Co.

The Report of the Meeting.

A special general meeting of shareholders was held at the offices of the company, Finsbury Circus, London, on Wednesday, Mr. Potts in the chair, to consider the present position of the company and the desirability of a voluntary winding up. The Chairman said the Directors had called the present meeting in order to lay before the shareholders such information as Mr. Rickard had sent over, relative to the position of the property. The Directors had delayed calling the present meeting in the hope that Mr. Rickard would have returned from America, and been present, in order to state the fullest particulars regarding the property. Unfortunately, Mr. Rickard had not returned, having been engaged in some mining speculation in America. After the letters of Mr. Rickard had been read, perhaps some of the shareholders might think there was a ray of hope with regard to prosecuting the mine, but they had spent money without any return, that possibly they might not think it worth while to go in any further. He might mention that himself and Mr. Wild did not intend to advance any more money and Mr. Hulbert had also lost heart. That being so, there was only one course, to wind up voluntarily and appoint liquidators. As regards the accounts, the Secretary would be able to render an account with regard to England, but it has been utterly impossible to get any reliable accounts whatever from the other side.

The Secretary then read extracts from the most recent letters from the mine, showing the present unfortunate position of the property and the utter impossibility of continuing operations unless further money was forthcoming. The Secretary also mentioned that a debenture holder in this country had already lodged a petition for the compulsory winding up of the company. The Secretary, in answer to questions, said it would take about £5,000 to pay off the present indebtedness, but it would leave no capital to go on with and they would require another £5,000 to develop the property. Some time since a telegram was sent over from here, saying that funds were required to release the property; and in answer to a question as to how much it would take, the reply was \$4,000. A sum of £800 was subscribed and sent over to enable the property to be released, but it was afterwards found that considerable more than that amount was required, as the £800 only went a small way towards paying the workmen and such like things. Mr. Nelson, who had been sent out, had proved of no service whatever, and he (the Secretary) had never been able to obtain any information from him relative to the accounts. A shareholder said, it was

clear that unless a certain sum of money could be raised, it was utterly impossible to continue operations at the mine. The property was mortgaged to secure the debentures, which were a first charge upon it. It is impossible to raise money in operations. The proper course to pursue would be to direct the Board to place the company in a proper condition for liquidation. A lengthened conversation ensued, in the course of which several legal points were raised, which were replied to by the solicitor. Eventually it was decided to liquidate the company voluntarily, and Mr. I. H. Taylor and Mr. Bluett were appointed liquidators.

Poisoned Arrows.

EDITORS PRESS:—Entomological investigation is now receiving special attention at the national capital, and at the last two or three meetings of the Philosophical Society here, papers have been read on the subject of poisoned arrows. At the meeting of the Society held on the 22d of December, Maj. Powell advanced the belief that poisoned arrows were not and had not been in use by any of the American aboriginal tribes. At the last meeting of the Society, Dr. Elliott Cones, Secretary of Prof. Hayden's Geological Survey, made some remarks on the subject, based on his own observations as a surgeon in the army, having, on frequent occasions, while stationed at military posts in the Indian country, dressed wounds inflicted by poisoned arrows used by Indians, on soldiers and others. Dr. Cones was also fortified by many facts, placed in the form of notes by Dr. Hoffman, of the Hayden Survey, based on his own experience, coupled with many illustrations obtained from other reliable sources.

During the time of Dr. Hoffman's residence at the military station at Grand river, D. T., in 1872-3, as Post Surgeon, he devoted most of his spare time to the study of the language of the Dacotahs, in addition to observations upon their customs, ceremonies and the mode of manufacturing weapons, implements and utensils. The whole number of names upon the rolls at the Agency here amounted to 13,500; 8,500 of this number avoided the settlement and were known as "hostiles." The remaining 5,000 lived in various localities, at from five to 40 miles from the agency. As most of these encampments were permanent, frequent excursions were made to some of them.

As the custom of poisoning arrows is not in general use in this day of firearms, a description of the mode of preparing the poison and its subsequent application to the arrow points will be of some interest.

The arrow-maker and the owner of the weapons go to one of the numerous prairie-dog towns, in and about which rattlesnakes (*Candisona confluenta*), say, are to be found. One of the Indians is armed with several sticks, each from three to four feet in length, some of which are forked at one end; likewise the liver of an antelope or deer, usually the former, as they are more easily procured. When a rattlesnake is found, its escape is prevented by being gently but securely held to the ground by means of one of the forked sticks, which is placed about the middle of the body. The other Indian now impales the liver upon a slightly pointed stick, and by thrusting it at and teasing the snake, the latter becomes enraged and buries its fangs repeatedly in the liver. When the reptile has exhausted itself or refuses to bite any longer, it is killed. The liver is then carried back to camp and there placed upon a pole for exposure to the rays of the sun to hasten decomposition. This usually takes place in the course of a day, the actual length of time depending upon the state of the atmosphere. After the liver has become putrid, it is carefully taken down, put into a small vessel, where it is crushed and beaten into a plastic mass. The points of the arrows are then dipped into the viscid scum which accumulates upon the surface, after which they are allowed to dry. Finally they are placed, point downward, into one of the compartments of the quiver, reserved for poisoned arrows, and secured about the top with an extra thong, so as to prevent mistakes in their use. The other portion of the quiver contains the ordinary arrows employed in the chase.

A bow and quiver of arrows always forms a part of a warrior's outfit, and these are frequently brought into requisition on account of the noiseless manner in which they can be used. Whether the fatal effects of poisoned arrows are due to the presence of the venom, is a subject that requires investigation. The opinion of Dr. Hoffman is that the venom plays a very important part. The fact that the Indians have vegetable antidotes, and understand their application and effects, illustrates that they learned the fatality of the bite of the *Candisona*, and their ultimate employment of the venom as a toxic agent upon their arrows.

The Coyotero Apaches in the vicinity of Camp Apache, Arizona, are also known to occasionally use poisoned arrows. The Indians at this place exhibited many arrows which they said were poisoned, and it was perceived that the base of the arrow head in each case was covered with a dark brown, gummy substance, which was absent in the ordinary types. Dr. Milan Soule, who was for several years Post Surgeon at the above named locality, states that this sub-tribe of Apaches sometimes use poisoned arrows.

Dr. Elliott Cones, of the U. S. Army, furnishes, among others, ("Medical and Surgical Reporter," Vol. XIV, pp. No. 17, 321-324), an in-

teresting case of an arrow wound, which, on account of its peculiar progress and fatal termination, was, very justly, considered by him to have been a poisoned one. This case also was observed in Arizona.

Mr. James Stevenson, of Prof. Hayden's Survey, states that the Crows, Blackfeet, Assiniboines and Northern Dacotahs poison their arrows. The latter named tribe has already been alluded to. The other three prepare their poisoned arrows in the following manner, viz.: A rattlesnake is secured, and so tantalized or provoked that it will bite a piece of smooth wood or bark held by one of the Indians, after which the arrow points are rubbed upon the venom, and allowed to dry. The venom, just after it has been deposited upon the bark, is semi-translucent, and of a glutinous consistency. Frequently the heads of rattlesnakes are kept on hand for future use, when the poison sac can be extracted, and the venom utilized as required.

Prof. F. V. Hayden substantiates the above statement, and in addition says that these operations could be seen whenever there was any considerable gathering of Indians, such as when making the necessary preparations for a grand hunt, or a hostile expedition.

The very reason that some of the quivers are divided into two partitions, one of them as the receptacle for so-called poisoned arrows, is sufficient to show that these Indians apply some substance intended to insure the death of the subject upon which it may be used.

Some of the "Diggers" living in the upper portion of California are known to use the juice of the wild parsnip, mixed with the putrid liver of a dog. Mr. W. H. Dall, of the U. S. Coast Survey, has observed that the natives living in northeastern Siberia poison their weapons by dipping them into the putrid liver of the white bear. The liver is said by Mr. Dall, to be poisonous even when fresh. The natives use their poisoned arrows in the destruction of beasts of prey, and other animals whose flesh is unfit for food, such as wolves, foxes, etc.

The use of the woorara poison by some of the South American Indians is a well known fact. Schombergk says: "The woorara or ourara poison is prepared by the Makosio Indians from the pirarira and by the Warpeshanes of the Eonoco mountains on the Orinoco from a new strychnos, toxifera." N. H. Schombergk; strychnos toxifera; foliis ovato lanceolatis, acuminatis, 3-5 nervis utrinque ramulique ferrugineo tomentosis, bacca polysperma (Oken's Isis, hd. xxxi, 1835, p. 100.) ["The Lond. and Edin. Philosophical Mag. and Jr. of Science," vol. x, 1837, p. 72.]

It was at one time supposed that the origin of venereal diseases was due to the poison employed in the destruction of fish and game. In this connection Dr. Rees (The Cyclopaedia, or Universal Dictionary of Arts, Sciences and Literature, by Abraham Rees, etc., Phila., vol. 1, under the title of "America,") says: "It has been pretended, that the flesh of fish intoxicated with the cururu, ape and the flesh of the game killed with arrows poisoned with a species of woodbine called woorara, produced this contagion among them." This quotation has reference to the West India Islands, the Caribbees, Florida, Mexico and Peru. Mr. Rees further states that "In the Island of San Domingo, where the venereal disease was extremely rife, the use of poisoned darts was not in practice as among the Caribs and several families on Terra Firma."

Sufficient evidence has been obtained to illustrate the fact that poisoning arrows is still practiced by tribes within the limits of the United States, without having to hunt elsewhere to show that such customs exist or ever did exist.

Washington, D. C., Jan. 21.

Mines or "Prospects."

Why does the *Citizen* persist in calling Conelly's mine the Guanajuato, when the owners call it the Whana Whata, the Whana Uhata, and other names? It has been incorporated as the Wana Juata—they knew there was a "Q" in it somewhere. There has been such a clashing of cymbals and tooting of horns over this location that there is danger of California thinking that Arizona considers this phonetically named mine the biggest thing we've got. Some of us fellows, who have never seen it, are beginning to think its owners are developing their bonanza with gas rather than with blasting powder. We have no doubt it is a pretty good property, but there has yet occurred nothing that gives it rank, even among our third rate mines. There has been no reason in the laudatory spasms of the Los Angeles papers—unless they got some of the stock. Solid silver from it was shipped to San Francisco in sacks and boxes—and proved to be chiefly manganese and magnesium. Assays were promised of thousands of dollars per ton—results gave only hundreds. Of two lots, one assayed 138 ounces and the other about 200. Such things hurt the country. When a man tries to interest capital in a really meritorious property, he is forced to prove that it is not another phonetic Guanajuato. This premature puffing of mere croppings has always injured mining districts. The proper time for blowing and flourish of trumpets arrives when a mine has been passably opened, is turning out hullion and has something in sight. Then it is safe to let the eagle scream a little. Puffing croppings is like blowing up a bladder; too much inflation bursts the outfit. We have good mines enough to boast of, without wasting ourselves on good places for dumps.—*Arizona Sentinel*.

Eastern Oregon Mining Prospects.

A correspondent of the *Idaho Avalanche* says: If past endeavor may be considered an earnest of future attempt, eastern Oregon has much to expect during the coming year, from the labors of the prospecting miners scattered throughout her territory. Evidence of the efforts made by these fortune hunters to unearth the treasures concealed in our mountains, streams and gulches abound on every hand. Indeed, the long ditches, deep shafts, wide cuts and giant piles of quartz and gravel speak more eloquently on their behalf than anything I could hope to write. If faith, hope, energy and industry were of themselves sufficient to the complete development of our mineral resources, a prosperous future for this section of the country would be insured. Apart from what has been done during the past year in the way of placing our quartz mines on a paying basis, through the agency of these attributes alone, much that is worthy of notice has also been accomplished in the way of opening the placer claims of Baker and Union counties. As far as the yield of gold from quartz is concerned every miner knows that it must depend in a great measure on the caprice of capital, if that essential can be called caprice. But with surface diggings it is different. Fortunately for their development, capital is not in all cases required, and much can be accomplished by individual effort where corporate action would be essential to the successful working of quartz. Given a fair prospect, a decent "grub stake" and any possibility of getting water on to the claim, the average miner will, in nine cases out of ten, have a ditch on to the premises if nerve and muscle will do it.

Despite the scarcity of water, there has been much activity displayed in all our placer fields during the season of '77. From Pocatontas, Auburn, Clark's creek, El Dorado, Malheur, Mormon Basin and Rye valley returns are reported commensurate with those of more favorable seasons. Here on Snake river and in the vicinity of Burnt river some 20 claims have been opened, paying all the way from \$2 to half an ounce per day to man. Foremost among the enterprises of this kind that have occupied the attention of the public must be placed the successful termination of Mr. Thomas Huffman's project to bring Douglas Bar near the mouth of Connor creek, under the potent influence of a bydraulic head. This Bar is said to be one of the richest spots on Snake river. Judging from external appearances it may be appropriately termed a foothill of the Snake river mountains, lying as it does at the very foot of the range, with no apparent line of demarcation between the wash gravel of which it is constituted and the talcose state of the ridge it borders. Taking as a point of departure the left bank of Connor creek it extends in a northerly direction a mile from that stream, and has an average width of 150 yards. The subsidence of Snake river from this, its old channel, to its present bed, has left the surface of the bar at an elevation of 200 feet above the level of that stream. The mean depth of the gravel is 15 feet. Before attempting to bring water on to the ground Mr. H. prospected it carefully at different points and was encouraged to proceed from the flattering nature of the prospects discovered. Satisfied of its richness, nothing remained to be done but to introduce the water to make it a source of revenue. The way was not clear, however. There were obstacles to be met and overcome. With the resolution of an old-timer Mr. H. set to work, confident that the attainment of his end would fully compensate him for the outlay of time and trouble. He was met at the outset with more claimants to the water, as he expressed it, than you could shake a stick at. By one means and another, however, he succeeded in acquiring the title and started to excavate his ditch in August last. Much of its course lies through hard rock, and blasting had to be resorted to. A half mile of the distance had to be flumed, and 17,000 feet of lumber were used for that purpose alone. Nearly \$3,000 were paid for labor and the result of this expenditure of time, and thought, and labor and money is a conduit three miles long with a capacity for 300 inches of water, which will have a fall of 125 on to the ground, that has yielded as high as \$2.50 to the pan. Mr. Huffman has just received an offer of \$8,000 for the property.

Messrs. Grayson, Woods & Thompson own a claim embracing 1,000 feet of this bar and with commendable industry and prudence are energetically pushing a drift across their property to test the value of the same.

On Connor creek, near the site of the old Sleeper mill, Frazer, Way & Bohena are attempting to reach bedrock. An incredible amount of work has been done at this claim and, from present indications more remains to be done before bedrock is reached. Good prospects have been found from the surface down for a depth of 30 feet. Recently a derrick has been erected which will facilitate the handling of the boulders encountered. The Connor Creek mill and mining company are running 15 stamps, crushing 27 tons of ore per day of 24 hours and are reported to be cleaning up at the rate of \$7,000 per month. Only eight miners are employed.

A MAN who recently went to the Black hills, wrote back to his friends as follows: "Offer a premium at your next fair for the biggest fool in the country and I will try and get there in time."

MECHANICAL PROGRESS.

Hints for Iron Melters.

The man who prepares and charges the cupola in a foundry holds the key to the production of good castings, no matter how successfully the molder may do his work. It is important, then, that all melters should study their business and learn what are the points of success. In the course of an able series of articles on iron-founding, which Edward Kirk is writing for the *Iron Age*, we find the following hints on the work of the melter: The practical and scientific melter is the melter who understands his business and attends to his business; he chips out his cupola, and daubs it up in proper shape; he puts up the iron bottom and sees that it fits close and solid and is properly supported; he puts in the sand-bottom, and sees that it is packed solid and even, and has the proper pitch, without any hills or hollows in it; he puts in the front so that it never blows out, and he sees that the spout is in proper shape; he always has the tapping bars drawn down to a sharp point, so that he can tap with ease, and have the tap-hole large or small; he has his bod clay thoroughly mixed, and his bod-sticks always handy and in good shape. When he wants to stop-up he takes the bod-stick and sees that there is a bod on it in proper shape; he then puts the bod right over the tap-hole and gives it a sudden downward pressure, and stops the iron with ease. He puts in the shavings to light the fire with, and sees that they are properly spread over the sand-bottom, so as to light the wood evenly—the wood is cut short and split, and every piece is laid in the cupola in proper shape, so as to give the fire the best possible chance to burn and light the coke or coal evenly; he selects a few small pieces of coal or coke that will light easily, and puts them in on the wood; he then puts in the bed. If the cupola has a good draft he puts in all of the bed before the fire is lit, if the cupola has a poor draft, he only puts in part of the bed before the fire is lit, and the balance after the fire has got thoroughly started. He sees that the bed is evenly burnt and level on top before the iron is charged; he charges the iron compactly together, so that it will get the good of all the heat from the fuel; he sees that every charge of iron is level and even on top when all in; he sees that every charge of fuel is properly distributed over the iron, so that it will melt the next charge of iron properly, and at an even temperature; he increases or diminishes the amount of coal or coke in the bed, or between the charges of iron, at the rate of 25 or 50 pounds at a time, until he finds the exact amount required; he increases or diminishes the amount of iron on the bed, or in the charges, at the rate of 100 pounds at a time, until he finds the exact amount of iron that can be melted in that particular cupola with the smallest percentage of fuel; he then continues that charging without any variation; if he gets in a poor lot of fuel, he may increase the bed and charges of fuel a few pounds; or, if the fuel is extra good, he may decrease a few pounds, but always with caution and safety; he watches the direction the wind blows, and notes the effect that a north, south, east or west wind has upon the draft of his cupola, and he lights his fire accordingly, so as to have the bed burnt as near alike every day as possible; he inspects the blast-pipe and tuyeres every day to see that there are no holes in the pipe through which the blast may escape, and to see that the tuyeres are in proper shape, so that the blast will not escape up behind and through the lining, in place of through the stock; he notices the exact effect of the blast upon the cupola, and he knows when he is not getting enough blast, and at once complains to the foreman or engineer; he looks around the shop, toward the last of the heat, and sees or asks the foreman how much more iron is wanted; he then looks into the cupola, and if he thinks there is not enough iron in to pour off with, he throws in a little more, before the stock gets too low to melt it. The practical and scientific melter does everything according to rule, and not by guess, and the foundrymen can depend upon him having good, hot, clean iron every day, if it is possible to make it in his cupola.

Notes on Concrete.

Concrete in this State is widely used for foundations and for other building purposes. The following hints from *Seward's Journal* will be found valuable: Much harm is done, time wasted and annoyance caused by the habit of inexperienced persons picking and poking at cement samples of work, before it has had time to get strength. To such persons quick-setting, light-weight cements would appear to promise good results; but it is now well known by every one practically acquainted with the use of cement, that the well-burned, heavy, finely-ground, slow-setting concretes, are the best for concrete purposes.

The water for mixing concrete should be clean. It is possible to destroy much of the strength of cement by using dirty or polluted water. Sea water has not been found injurious, but it is supposed to delay the setting. Respecting the quantity of water to be used there is more danger to be apprehended from using less than from using more than the right quantity. The correct quantity of water is of course sufficient to convert the cement into a thin paste, that shall completely coat and

causo to adhere all the particles of the aggregate.

Concrete mixed by hand is preferable, as it is important to have the materials all mixed dry before mixing with water. Crystallization, or setting, begins at once with the addition of the water, and as little time as possible should be spent in thoroughly mixing and placing into the mold, or apparatus, after water has been added. There are many various concrete mixing machines, most of them being unnecessarily complicated; the best being a plain revolving cylinder working horizontally. Concrete mixed in machines is generally over-mixed after the addition of water.

The only liability to defects in cementing on concrete walls or floors, is where two coats are used, and when idle and ignorant workmen, to save themselves trouble, use too large a proportion of cement for the thin finishing coat; then in consequence of the variation in the contraction of the two coats, the outer one is liable to show fine surface or (as they are often called) sun cracks, and even in some cases to peel off. Of course this liability being known, can easily be provided against.

FORGING AND TEMPERING IRON AND STEEL.—The forging and tempering of iron or steel, says *Iron*, can be greatly enhanced, according to Herr Edward Blass, of Cleve, Prussia, by dipping the metal, in whatever form, in fused salt. This dipping in salt is also well adapted for annealing steel without the oxidation of the surface. If the metal be rusted, it must be allowed to remain some time in the bath. Borax can with good effect be mixed with the salt. Metal "purified" by such an immersion is very susceptible to galvanic depositions, and can easily be coated with copper, zinc, tin, nickel, silver, etc. For iron, in the spongy or powdered state, as obtained from the reduction of the ores, the salt bath is especially adapted, for it augments the combination of the particles by making their surfaces free from impurities. To prepare the bath for an application as here proposed, the salt must be fused in a puddling furnace, and the iron sponge, with the addition of a flux, be added in small quantities so as not to vitrify the salt. The iron is left in the furnace till the flux has combined with all the impurities and formed a slag, whereupon the iron is taken out and forged together. While the iron is in the furnace, it should be constantly covered with the salt, so that oxidation be prevented. For the hardening of iron, the salt is fused in a convenient vessel and the object immersed and from time to time a small quantity of ferrocyanide of potassa added, one or two pounds per 100 pounds of iron. The articles, according to their thickness, are permitted to remain from five to 30 minutes in this bath and are then plunged in water containing, in 100 parts, one part of hydrochloric acid, five of wine vinegar and one of salt. If the objects are to have a silver luster, they should be immersed for a few minutes in a mixture of three parts wine vinegar and one of hydrochloric acid.

PRIZE FOR STEAM WAGON.—Pennsylvania now promises to take her place in the list of States which offer a reward to the inventor of a successful steam road wagon. We read in the *American Manufacturer* that it is proposed, in a bill presented to the Pennsylvania Legislature, and now in the hands of the proper committee, to pay a premium or reward of \$10,000 to any citizen of the State who shall, within 10 years, construct upon plans of his own, and place in practical operation on the common roads, an engine or locomotive, propelled by steam power. The test required is that the engine shall propel itself a distance of 200 miles in a continuous direction, at an average speed of four miles an hour, and draw at least one vehicle carrying a weight of one ton. The construction of the apparatus is required to be such that it will conform to the track of the common wagon, turn out readily to pass other vehicles, ascend or descend grades of at least 300 feet to the mile, and apply power to at least one set of wheels on each carriage of the train designed to be drawn.

STEEL INSTEAD OF BRONZE.—The officers of the royal gun factories, says *Iron*, have been informed that the French government has resolved to discard its present system of bronze field-guns and make its guns of steel rings, puddled and cast. It has been under the consideration of the French artilleryists to adopt the English system of built-up, wrought-iron coils, including the muzzle-loading principle; but this would have required a new and extensive plant of machinery, whereas the transition from bronze to steel can be effected with very little trouble and expense, the substitution of a different metal being almost the only change. The preference of the French for breech-loading cannon is to be gratified by the application to these guns of the "screw relieve," or French system, and two kinds of field-pieces are to be produced—one rather larger than the English 16-pounder and the other somewhat smaller than the English nine-pounder, corresponding in size more nearly to the German than the English artillery.

CAST-IRON GLAZED TILES.—The *Deutsche Allgem. Zeitg.* says: At the iron works of Groeditz, near Riesa, Germany, glazed cast-iron tiles for roofing are now made. They are not heavier than ordinary tiles and are very strong. The railroad depots of Loebau and of Reichenbach, and of many private houses of Hamburg and Dresden are roofed with them.

SCIENTIFIC PROGRESS.

New Genus of Lumbriculidæ.

At the last meeting of the San Francisco Microscopical Society, Dr. Gustav Eison called attention to a new worm, about 20 inches long, which he had discovered in an irrigation ditch in Fresno county. His remarks were illustrated by exquisite drawings. The worm was a member of a new genus of *Lumbriculidæ*, which family had hitherto not been known to exist outside of Europe. Of this family, only five genera were previously known, viz.: *Stylocyrtus*, *Lumbriculus*, *Rhynchelmis*, *Phreatothrix*, *Trichodrilus*. The new genus added to the list was *Acerodrilus*.

Lumbriculidæ differs from all other families of *Oligochaeta*, in having four efferent ducts in the segment. *Stebificidæ* and other families had only two ducts in the same segment. From the genera in the same family, *Acerodrilus* is most remarkably distinct, clearly all its organs showing characteristics which even would place the genus in a new family. As very little is known of the anatomy of the *Oligochaeta* or earth-worms, every contribution is valuable and interesting.

In all other genera of *Lumbriculidæ* the ventral vessel is divided in some of the anterior segments; in *acerodrilus* the same vessel is entire. In all other genera of *Lumbriculidæ* the dorsal vessel is entire. In *Acerodrilus*, on the contrary, said vessel is divided in three branches, all three connecting in every segment with each other and with the ventral vessel. The alimentary canal is in the *oesophagus*, furnished with two large sack-like appendices, not met with elsewhere in this order. In the eighth and ninth segments, we find two pair of large pulsating hearts. In the other genera no hearts are met with.

Two pair of minute testes are found attached the disjunctments in the eighth and tenth segments. In other genera the testes are seldom found in pair and always very large, often filling a large part of the body. The ovaries are situated in the eleventh setigerous segment, and the oviducts, which, contrary to what is generally the case, are very large in the thirteenth setigerous segment. The efferent ducts are from the upper quarter, grown together, and at their lower end not furnished with any prostrate glands; neither do they enter a common atrium, which is elsewhere always the case. But the most remarkable characteristic of *Acerodrilus* is that the efferent ducts and the receptacle opens into the same external pore into the sixteenth segment, a fact not elsewhere met with. The receptacle, which is extraordinarily long, extends from the sixteenth to the twenty-fifth segment and sometimes further back.

Besides *Acerodrilus*, the Doctor has also found a species of each of the genera *Lumbriculus* and *Rhynchelmis*, the former in marshes in Sierra Nevada, the latter in the old mountain lake, near the Marine hospital, San Francisco. Besides, the Doctor thought that many new and interesting worms could be discovered in the many lakes and ponds of California, and called the attention of the members of the Society to the value and interest of even the smallest contributions, which he would most thankfully receive.

CONVERSION OF MOTION INTO HEAT.—M. Oliver gives, in the *Journal des Debats*, the following accounts of his interesting experiment in the illustration of the conversion of motion into heat: One end of a square bar of steel is held by one hand in the middle, and pressed strongly against a rapidly revolving emery wheel, by which means the extremity so applied becomes considerably heated. The band at the middle of the bar does not feel any change of temperature, but that at the other extremity is soon obliged to let go, the temperature rising to the point of burning the skin. This effect, which appears paradoxical at the first glance, is thus explained by M. Oliver: The heat that burns the hand is not generated at the other extremity of the bar and transmitted thence, but is produced directly at the place; movement and heat being synonymous; the movement destroyed by the hand at the outward extremity of the bar by the stoppage of the vibration is converted into heat, while, there being an interval of repose at the middle of the bar, no heat is perceived at the time. A curious feature of the experiment is that at the outer extremity the thermometer does not show any exceptional temperature, because the thermometer does not stop the vibration. To produce the heating effect, the hand should grasp the end of the bar with force enough to arrest the movement.

CLIMATIC CHANGES.—It would seem that not only is the climate of Iceland growing so cold that grain cannot ripen there, but that of Scandinavia and western Europe is becoming more severe. This is due, it is supposed, to the steady descent of the ice of the far north upon the shores of Iceland. It has been ascertained that the temperature of Greenland was once much more mild than at present. Plants have been discovered in a fossil state there which cannot now show a sign of life. In the Atlantic, also, ice has been found much further south than formerly. Is another ice age slowly making its approach?

The Liquefaction of Oxygen.

One of the most interesting of late advances in chemistry is the forcing of oxygen to take a liquid form. This has been done before with several other gases, and now we have but hydrogen, nitrogen and some of their compounds left in gaseous form. The achievement with oxygen was accomplished by a Frenchman, Raval Pictet, at Geneva, Switzerland, on December 22d, and at once telegraphed to Prof. Tyndall. The liquefaction of oxygen was accomplished in this way: By a double circulation of sulphurous acid and carbonic acid the latter gas, as is well known, is liquefied at a temperature of 63° of cold under a pressure of from four to six atmospheres. The details of the experiment are then as follows: The liquefied carbonic acid is led into a tube four meters in length; two compound-action pumps make a barometric vacuum in this acid, which solidifies, owing to the difference of pressure. In the interior of this first tube, containing the solidified carbonic acid, passes a smaller tube, in which there circulates a stream of oxygen. The oxygen is yielded by chlorate of potash in a strongly made cylindrical generator with egg-shaped ends. The generator will resist a pressure of 800 atmospheres. On the morning of the 22d the apparatus as described was put in proper trim, and when the pressure reached 300 atmospheres a jet of liquid oxygen spirted from the end of the tube at the moment when the compressed and frozen gas passed from this high pressure to that of the atmosphere. The great interest of the experiment lies in the experimental demonstration supplied by it of the mechanical theory of heat, aiding as it does in the proof that all the gases are vapors capable of successive transmutation from the gaseous to the liquid, and from the liquid to the solid form.

The degree of cold is not mentioned in the above hurried report. From Prof. Tyndall's telegram it appears to have been 100° C.; the pressure in the telegram is given 320 atmospheres, not 300.

It is also claimed in Geneva that about a fortnight ago M. Cailliet succeeded in liquefying the binoxide of nitrogen, under a pressure of 146 atmospheres, at a temperature of 11° of cold, but the experiment is not fully authenticated.

SPONTANEOUS GENERATION.—An interesting series of experiments has been conducted in London, says the *Polytechnic Review*, to decide the question of spontaneous generation; that is to say whether vegetable or animal life can start into existence itself or whether all life is but the perpetuation of life already existing. Prof. Tyndall declares the question "practically set at rest for the scientific world" in the negative. His last experiment was on the Alps, he took with him from London, packed in sawdust, 60 flasks containing infusions of animal and vegetable matter, boiled to destroy all living organisms and sealed while the fluid was still in ebullition. The necks of six of the flasks were broken by accident, and were found filled with organisms. The other 50 remained for six weeks perfectly clear and pellucid. Twenty-three of the flasks were then opened in a hay loft. The other 27 were opened at a high elevation, and on the edge of a precipice, where the air was absolutely pure and free from "spores." The two groups were then placed in a warm kitchen. The 27 flasks opened out of doors remained pure, and without any indication of microscopic life. Of the 23 opened in the hay loft 21 were instinct with life, and filled with darting, dancing minute forms. Two of the 23 remained clear.

A PHYLOXERA EATER.—The *London Farmer* says that at a recent sitting of the Paris Academy of Sciences a letter was read from M. Laliman, in which he describes a larva or grub which had been seen to devour 94 phylloxeras in the course of 10 minutes. He proposes for it the name of "Phylloxera cannibale." M. Balbini says that the larva belongs to the genus *Syrphus*, or some closely allied one, but declines to classify it more closely until he has seen the perfect insect. The larva destroys the phylloxera by seizing upon it and sucking out its fluid contents, and this maneuver it repeats until satisfied. Repletion is not readily reached it appears, for it thinks nothing of 12 dozen victims for a mere early breakfast.

ANT IN AMBER.—At the late meeting of the Microscopical Society, Mr. Woodward exhibited a fine specimen of mounting, performed in nature's laboratory, in the way of an ant in a piece of amber. This relic of cretaceous life had the good fortune to drop himself into the fluid resin as it escaped from the amber-fir, one of the conifers of that age; and thus embalmed, was preserved in the same manner objects are now mounted in Canada balsam, and when placed under a two-inch objective, was found to be perfect in detail as well as general form. It was fixed in a slide by Mr. Kinne, and placed in the cabinet for future examination.

NORTHERN EXPLORATION.—The Dutch are fitting up a vessel to engage in the exploration of the waters of Spitzbergen and Barentz next summer. Recent discoveries in these waters make it probable that this expedition will have a commercial value.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

The Eclipse Mining Company.

EDITORS PRESS:—Will you do me the favor of publishing the following in answer to a statement made at the last meeting of the Eclipse gold mining company, as reported in the London Mining Journal of December 22d, 1877. The statement is mischievous, and if uncontradicted is very likely to prove injurious:

The Eclipse mine, as of course you know, is in Inyo county, California, and is a most valuable property. Mismanagement and carelessness on the part of the home directors have resulted in the collapse, for which I, being several thousand miles away, am made the scapegoat. Two facts in reply to the imputations of incompetency and dilatoriness.

From April to August of last year I kept the mine constantly running under the burden of law suits, attachments, labor troubles and want of funds. Statement after statement of how matters stood was forwarded to the home office, to none of which I received a reply. Everything went on from bad to worse until, despairing of relief, and literally unable to obtain credit, I saw the Sheriff in possession and was compelled to leave for San Francisco. Even here I have heard nothing from headquarters, and it was only from the chance remark of a third party that I learned of the reported liquidation. In the second place, I have simply to say that statements were forwarded to Finsbury Circus regularly as possible under the existing circumstances at the time, and have since then kept them informed of vital matters relating to the mine, etc.

The foregoing is in answer more particularly to that portion of the Secretary's report, as copied in the journal referred to above, of which I extract the following:

"Mr. Nelson who had been sent out had proved of no service whatever, and he (the Secretary) had never been able to obtain any information from him relative to the accounts."

In conclusion I would add that if English capital invested as this had been, if properly managed by the officials at headquarters, shareholders would have obtained ample returns for their money invested and the blame of non-success is attributable to them (Directors) and not to their representatives on this side of the Atlantic. Although still these representatives here can but say that every assistance has been offered for their welfare, but they have not thought it worth while to avail themselves or appreciate the same.

C. S. NELSON.

Eclipse G. M. & Q. Co., Inyo Co.

The Report of the Meeting.

A special general meeting of shareholders was held at the offices of the company, Finsbury Circus, London, on Wednesday, Mr. Potts in the chair, to consider the present position of the company and the desirability of a voluntary winding up. The Chairman said the Directors had called the present meeting in order to lay before the shareholders such information as Mr. Rickard had sent over, relative to the position of the property. The Directors had delayed calling the present meeting in the hope that Mr. Rickard would have returned from America, and been present, in order to state the fullest particulars regarding the property. Unfortunately, Mr. Rickard had not returned, having been engaged in some mining speculation in America. After the letters of Mr. Rickard had been read, perhaps some of the shareholders might think there was a ray of hope with regard to prosecuting the mine, but they had spent money without any return, that possibly they might not think it worth while to go in any further. He might mention that himself and Mr. Wild did not intend to advance any more money and Mr. Hulbert had also lost heart. That being so, there was only one course, to wind up voluntarily and appoint liquidators. As regards the accounts, the Secretary would be able to render an account with regard to England, but it has been utterly impossible to get any reliable accounts whatever from the other side.

The Secretary then read extracts from the most recent letters from the mine, showing the present unfortunate position of the property and the utter impossibility of continuing operations unless further money was forthcoming. The Secretary also mentioned that a debenture holder in this country had already lodged a petition for the compulsory winding up of the company. The Secretary, in answer to questions, said it would take about £5,000 to pay off the present indebtedness, but it would leave no capital to go on with and they would require another £5,000 to develop the property. Some time since a telegram was sent over from here, saying that funds were required to release the property; and in answer to a question as to how much it would take, the reply was \$4,000. A sum of £800 was subscribed and sent over to enable the property to be released, but it was afterwards found that considerably more than that amount was required, as the £800 only went a small way towards paying the workmen and such like things. Mr. Nelson, who had been sent out, had proved of no service whatever, and he (the Secretary) had never been able to obtain any information from him relative to the accounts. A shareholder said, it was

clear that unless a certain sum of money could be raised, it was utterly impossible to continue operations at the mine. The property was mortgaged to secure the debentures, which were a first charge upon it. It is impossible to raise money in operations. The proper course to pursue would be to direct the Board to place the company in a proper condition for liquidation. A lengthened conversation ensued, in the course of which several legal points were raised, which were replied to by the solicitor. Eventually it was decided to liquidate the company voluntarily, and Mr. I. H. Taylor and Mr. Bluet were appointed liquidators.

Poisoned Arrows.

EDITORS PRESS:—Entomological investigation is now receiving special attention at the national capital, and at the last two or three meetings of the Philosophical Society here, papers have been read on the subject of poisoned arrows. At the meeting of the Society held on the 22d of December, Maj. Powell advanced the belief that poisoned arrows were not and had not been in use by any of the American aboriginal tribes. At the last meeting of the Society, Dr. Elliott Cones, Secretary of Prof. Hayden's Geological Survey, made some remarks on the subject, based on his own observations as a surgeon in the army, having, on frequent occasions, while stationed at military posts in the Indian country, dressed wounds inflicted by poisoned arrows used by Indians, on soldiers and others. Dr. Cones was also fortified by many facts, placed in the form of notes by Dr. Hoffman, of the Hayden Survey, based on his own experience, coupled with many illustrations obtained from other reliable sources.

During the time of Dr. Hoffman's residence at the military station at Grand river, D. T., in 1872-3, as Post Surgeon, he devoted most of his spare time to the study of the language of the Dakotahs, in addition to observations upon their customs, ceremonies and the mode of manufacturing weapons, implements and utensils. The whole number of names upon the rolls at the Agency here amounted to 13,500; 8,500 of this number avoided the settlement and were known as "hostiles." The remaining 5,000 lived in various localities, at from five to 40 miles from the agency. As most of these encampments were permanent, frequent excursions were made to some of them.

As the custom of poisoning arrows is not in general use in this day of firearms, a description of the mode of preparing the poison and its subsequent application to the arrow points will be of some interest.

The arrow-maker and the owner of the weapons go to one of the numerous prairie-dog towns, in and about which rattlesnakes (*Candisona confueta*), say, are to be found. One of the Indians is armed with several sticks, each from three to four feet in length, some of which are forked at one end; likewise the liver of an antelope or deer, usually the former, as they are more easily procured. When a rattlesnake is found, its escape is prevented by being gently but securely held to the ground by means of one of the forked sticks, which is placed about the middle of the body. The other Indian now impales the liver upon a slightly pointed stick, and by thrusting it at and teasing the snake, the latter becomes enraged and buries its fangs repeatedly in the liver. When the reptile has exhausted itself or refuses to bite any longer, it is killed. The liver is then carried back to camp and there placed upon a pole for exposure to the rays of the sun to hasten decomposition. This usually takes place in the course of a day, the actual length of time depending upon the state of the atmosphere. After the liver has become putrid, it is carefully taken down, put into a small vessel, where it is crushed and beaten into a plastic mass. The points of the arrows are then dipped into the viscid scum which accumulates upon the surface, after which they are allowed to dry. Finally they are placed, point downward, into one of the compartments of the quiver, reserved for poisoned arrows, and secured about the top with an extra thong, so as to prevent mistakes in their use. The other portion of the quiver contains the ordinary arrows employed in the chase.

A bow and quiver of arrows always forms a part of a warrior's outfit, and these are frequently brought into requisition on account of the noiseless manner in which they can be used. Whether the fatal effects of poisoned arrows are due to the presence of the venom, is a subject that requires investigation. The opinion of Dr. Hoffman is that the venom plays a very important part. The fact that the Indians have vegetable antidotes, and understand their application and effects, illustrates that they learned the fatality of the bite of the *Candisona*, and their ultimate employment of the venom as a toxic agent upon their arrows.

The Coyotero Apaches in the vicinity of Camp Apache, Arizona, are also known to occasionally use poisoned arrows. The Indians at this place exhibited many arrows which they said were poisoned, and it was perceived that the base of the arrow head in each case was covered with a dark brown, gummy substance, which was absent in the ordinary types. Dr. Milan Soule, who was for several years Post Surgeon at the above named locality, states that this sub-tribe of Apaches sometimes use poisoned arrows.

Dr. Elliott Cones, of the U. S. Army, furnishes, among others, ("Medical and Surgical Reporter," Vol. XIV, pp. No. 17, 321-324), an in-

teresting case of an arrow wound, which, on account of its peculiar progress and fatal termination, was, very justly, considered by him to have been a poisoned one. This case also was observed in Arizona.

Mr. James Stevenson, of Prof. Hayden's Survey, states that the Crows, Blackfeet, Assiniboines and Northern Dakotahs poison their arrows. The latter named tribe has already been alluded to. The other three prepare their poisoned arrows in the following manner, viz.: A rattlesnake is secured, and so tantalized or provoked that it will bite a piece of smooth wood or bark held by one of the Indians, after which the arrow points are rubbed upon the venom, and allowed to dry. The venom, just after it has been deposited upon the bark, is semi-transparent, and of a glutinous consistency. Frequently the heads of rattlesnakes are kept on hand for future use, when the poison sac can be extracted, and the venom utilized as required.

Prof. F. V. Hayden substantiates the above statement, and in addition says that these operations could be seen whenever there was any considerable gathering of Indians, such as when making the necessary preparations for a grand hunt, or a hostile expedition.

The very reason that some of the quivers are divided into two partitions, one of them as the receptacle for so-called poisoned arrows, is sufficient to show that these Indians apply some substance intended to insure the death of the subject upon which it may be used.

Some of the "Diggers" living in the upper portion of California are known to use the juice of the wild parsnip, mixed with the putrid liver of a dog. Mr. W. H. Dall, of the U. S. Coast Survey, has observed that the natives living in northeastern Siberia poison their weapons by dipping them into the putrid liver of the white bear. The liver is said by Mr. Dall, to be poisonous even when fresh. The natives use their poisoned arrows in the destruction of herds of prey, and other animals whose flesh is unfit for food, such as wolves, foxes, etc.

The use of the wooraly poison by some of the South American Indians is a well known fact. Schombergk says: "The wooraly or ourary poison is prepared by the Makosic Indians from the pirairia and by the Warpesbaues of the Eonocon mountains on the Orinoco from a new strychnos, toxifera." N. H. Schombergk; strychnos toxifera; foliis ovato lanceolatis, acuminatis, 3-5 nervis utrinque ramulicis ferrugineo tomentosis, hacca polysperma (Oken's Isis, Bd. XXXI, 1838, p. 100.) ["The Lond. and Edin. Philosophical Mag. and Jr. of Science," vol. x, 1837, p. 72.]

It was at one time supposed that the origin of venereal diseases was due to the poison employed in the destruction of fish and game. In this connection Dr. Rees (The Cyclopaedia, or Universal Dictionary of Arts, Sciences and Literature, by Abraham Rees, etc., Phila., vol. I., under the title of "America," says: "It has been pretended, that the flesh of fish intoxicated with the curruu, ape and the flesh of the game killed with arrows poisoned with a species of woodbine called wooraly, produced this contagion among them." This quotation has reference to the West India Islands, the Caribbees, Florida, Mexico and Peru. Mr. Rees further states that "In the Island of San Domingo, where the venereal disease was extremely rife, the use of poisoned darts was not in practice as among the Caribs and several families on Terra Firma."

Sufficient evidence has been obtained to illustrate the fact that poisoning arrows is still practiced by tribes within the limits of the United States, without having to hunt elsewhere to show that such customs exist or ever did exist.

Washington, D. C., Jan. 21.

Mines or "Prospects."

Why does the *Citizen* persist in calling Conelly's mine the Guanajuato, when the owners call it the Whana Whata, the Whana Uhata, and other names? It has been incorporated as the Wana Juata—they knew there was a "j" in it somewhere. There has been such a clashing of cymbals and tooting of horns over this location that there is danger of California thinking that Arizona considers this phonetically named mine the biggest thing we've got. Some of us fellows, who have never seen it, are beginning to think its owners are developing their honanza with gas rather than with blasting powder. We have no doubt it is a pretty good property, but there has yet occurred nothing that gives it rank, even among our third rate mines. There has been no reason in the landatory spasms of the Los Angeles papers—unless they got some of the stock. Solid silver from it was shipped to San Francisco in sacks and boxes—and proved to be chiefly manganese and magnesium. Assays were promised of thousands of dollars per ton—results gave only hundreds. Of two lots, one assayed 138 ounces and the other about 200. Such things hurt the country. When a man tries to interest capital in a really meritorious property, he is forced to prove that it is not another phonetic Guanajuato. This premature puffing of mere croppings has always injured mining districts. The proper time for blowing and flourish of trumpets arrives when a mine has been passably opened, is turning out bullion and has something in sight. Then it is safe to let the eagle scream a little. Puffing croppings is like blowing up a bladder; too much inflation bursts the outfit. We have good mines enough to hoast of, without wasting ourselves on good places for dumps.—*Arizona Sentinel*.

Eastern Oregon Mining Prospects.

A correspondent of the *Idaho Avalanche* says: If past endeavor may be considered an earnest of future attempt, eastern Oregon has much to expect during the coming year, from the labors of the prospecting miners scattered throughout her territory. Evidence of the efforts made by these fortune hunters to unearth the treasures concealed in our mountains, streams and gulches abound on every hand. Indeed, the long ditches, deep shafts, wide cuts and giant piles of quartz and gravel speak more eloquently on their behalf than anything I could hope to write. If faith, hope, energy and industry were of themselves sufficient to the complete development of our mineral resources, a prosperous future for this section of the country would be insured. Apart from what has been done during the past year in the way of placing our quartz mines on a paying basis, through the agency of these attributes alone, much that is worthy of notice has also been accomplished in the way of opening the placer claims of Baker and Union counties. As far as the yield of gold from quartz is concerned every miner knows that it must depend in a great measure on the caprice of capital, if that essential can be called caprice. But with surface diggings it is different. Fortunately for their development, capital is not in all cases required, and much can be accomplished by individual effort where corporate action would be essential to the successful working of quartz. Given a fair prospect, a decent "grub stake" and any possibility of getting water on to the claim, the average miner will, in nine cases out of ten, have a ditch on to the premises if nerve and muscle will do it.

Despite the scarcity of water, there has been much activity displayed in all our placer fields during the season of '77. From Pocatontas, Auburn, Clark's creek, El Dorado, Malheur, Mormon Basin and Rye valley returns are reported commensurate with those of more favorable seasons. Here on Snake river and in the vicinity of Burnt river some 20 claims have been opened, paying all the way from \$2 to half an ounce per day to man. Foremost among the enterprises of this kind that have occupied the attention of the public must be placed the successful termination of Mr. Thomas Huffman's project to bring Douglas Bar near the mouth of Connor creek, under the potent influence of a hydraulic head. This Bar is said to be one of the richest spots on Snake river. Judging from external appearances it may be appropriately termed a foothill of the Snake river mountains, lying as it does at the very foot of the range, with no apparent line of demarcation between the wash gravel of which it is constituted and the talcose state of the ridge it borders. Taking as a point of departure the left bank of Connor creek it extends in a northerly direction a mile from that stream, and has an average width of 150 yards. The subsidence of Snake river from this, its old channel, to its present bed, has left the surface of the bar at an elevation of 200 feet above the level of that stream. The mean depth of the gravel is 15 feet. Before attempting to bring water on to the ground Mr. H. prospected it carefully at different points and was encouraged to proceed from the flattering nature of the prospects discovered. Satisfied of its richness, nothing remained to be done but to introduce the water to make it a source of revenue. The way was not clear, however. There were obstacles to be met and overcome. With the resolution of an old-timer Mr. H. set to work, confident that the attainment of his end would fully compensate him for the outlay of time and trouble. He was met at the outset with more claimants to the water, as he expressed it, than you could shake a stick at. By one means and another, however, he succeeded in acquiring the title and started to excavate his ditch in August last. Much of its course lies through hard rock, and blasting had to be resorted to. A half mile of the distance had to be flumed, and 17,000 feet of lumber were used for that purpose alone. Nearly \$3,000 were paid for labor and the result of this expenditure of time, and thought, and labor and money is a conduit three miles long with a capacity for 300 inches of water, which will have a fall of 125 on to the ground, that has yielded as high as \$2.50 to the pan. Mr. Huffman has just received an offer of \$8,000 for the property.

Messrs. Grayson, Woods & Thompson own a claim embracing 1,000 feet of this bar and with commendable industry and prudence are energetically pushing a drift across their property to test the value of the same.

On Connor creek, near the site of the old Sleeper mill, Frazer, Way & Bohena are attempting to reach bedrock. An incredible amount of work has been done at this claim and, from present indications more remains to be done before bedrock is reached. Good prospects have been found from the surface down for a depth of 30 feet. Recently a derrick has been erected which will facilitate the handling of the boulders encountered. The Connor Creek mill and mining company are running 15 stamps, crushing 27 tons of ore per day of 24 hours and are reported to be cleaning up at the rate of \$7,000 per month. Only eight miners are employed.

A MAN who recently went to the Black hills, wrote back to his friends as follows: "Offer a premium at your next fair for the biggest fool in the country and I will try and get there in time."

MECHANICAL PROGRESS.

Hints for Iron Melters.

The man who prepares and charges the cupola in a foundry holds the key to the production of good castings, no matter how successfully the molder may do his work. It is important, then, that all melters should study their business and learn what are the points of success. In the course of an able series of articles on iron-founding, which Edward Kirk is writing for the *Iron Age*, we find the following hints on the work of the melter: The practical and scientific melter is the melter who understands his business and attends to his business; he chips out his cupola, and daubs it up in proper shape; he puts up the iron bottom and sees that it fits close and solid and is properly supported; he puts in the sand-bottom, and sees that it is packed solid and even, and has the proper pitch, without any hills or hollows in it; he puts in the front so that it never blows out, and he sees that the spout is in proper shape; he always has the tapping bars drawn down to a sharp point, so that he can tap with ease, and have the tap-hole large or small; he has his bod clay thoroughly mixed, and his bod-sticks always handy and in good shape. When he wants to stop-up he takes the bod-stick and sees that there is a bod on it in proper shape; he then puts the hod right over the tap-hole and gives it a sudden downward pressure, and stops the iron with ease. He puts in the shavings to light the fire with, and sees that they are properly spread over the sand-bottom, so as to light the wood evenly—the wood is cut short and split, and every piece is laid in the cupola in proper shape, so as to give the fire the best possible chance to burn and light the coke or coal evenly; he selects a few small pieces of coal or coke that will light easily, and puts them in on the wood; he then puts in the bod. If the cupola has a good draft he puts in all of the bed before the fire is lit, if the cupola has a poor draft, he only puts in part of the bed before the fire is lit, and the balance after the fire has got thoroughly started. He sees that the bed is evenly burnt and level on top before the iron is charged; he charges the iron compactly together, so that it will get the good of all the heat from the fuel; he sees that every charge of iron is level and even on top when all in; he sees that every charge of fuel is properly distributed over the iron, so that it will melt the next charge of iron properly, and at an even temperature; he increases or diminishes the amount of coal or coke in the bed, or between the charges of iron, at the rate of 25 or 50 pounds at a time, until he finds the exact amount required; he increases or diminishes the amount of iron on the bed, or in the charges, at the rate of 100 pounds at a time, until he finds the exact amount of iron that can be melted in that particular cupola with the smallest percentage of fuel; he then continues that charging without any variation; if he gets in a poor lot of fuel, he may increase the bed and charges of fuel a few pounds; or, if the fuel is extra good, he may decrease a few pounds, but always with caution and safety; he watches the direction the wind blows, and notes the effect that a north, south, east or west wind has upon the draft of his cupola, and he lights his fire accordingly, so as to have the bed burnt as near alike every day as possible; he inspects the blast-pipe and tuyeres every day to see that there are no holes in the pipe through which the blast may escape, and to see that the tuyeres are in proper shape, so that the blast will not escape up behind and through the lining, in place of through the stock; he notices the exact effect of the blast upon the cupola, and he knows when he is not getting enough blast, and at once complains to the foreman or engineer; he looks around the shop, toward the last of the heat, and sees or asks the foreman how much more iron is wanted; he then looks into the cupola, and if he thinks there is not enough iron in to pour off with, he throws in a little more, before the stock gets too low to melt it. The practical and scientific melter does everything according to rule, and not by guess, and the foundrymen can depend upon him having good, hot, clean iron every day, if it is possible to make it in his cupola.

Notes on Concrete.

Concrete in this State is widely used for foundations and for other building purposes. The following hints from *Savard's Journal* will be found valuable: Much harm is done, time wasted and annoyance caused by the habit of inexperienced persons picking and poking at cement samples of work, before it has had time to get strength. To such persons quick-setting, light-weight cements would appear to promise good results; but it is now well known by every one practically acquainted with the use of cement, that the well-burned, heavy, finely-ground, slow-setting concretes, are the best for concrete purposes.

The water for mixing concrete should be clean. It is possible to destroy much of the strength of cement by using dirty or polluted water. Sea water has not been found injurious, but it is supposed to delay the setting. Respecting the quantity of water to be used there is more danger to be apprehended from using less than from using more than the right quantity. The correct quantity of water is of course sufficient to convert the cement into a thin paste, that shall completely coat and

cause to adhere all the particles of the aggregate.

Concrete mixed by hand is preferable, as it is important to have the materials all mixed dry before mixing with water. Crystallization, or setting, begins at once with the addition of the water, and as little time as possible should be spent in thoroughly mixing and placing into the mold, or apparatus, after water has been added. There are many various concrete mixing machines, most of them being unnecessarily complicated; the best being a plain revolving cylinder working horizontally. Concrete mixed in machines is generally over-mixed after the addition of water.

The only liability to defects in cementing on concrete walls or floors, is where two coats are used, and when idle and ignorant workmen, to save themselves trouble, use too large a proportion of cement for the thin finishing coat; then in consequence of the variation in the contraction of the two coats, the outer one is liable to show fine surface or (as they are often called) sun cracks, and even in some cases to peel off. Of course this liability being known, can easily be provided against.

FORGING AND TEMPERING IRON AND STEEL.

The forging and tempering of iron or steel, says *Iron*, can be greatly enhanced, according to Herr Edward Blass, of Cleve, Prussia, by dipping the metal, in whatever form, in fused salt. This dipping in salt is also well adapted for annealing steel without the oxidation of the surface. If the metal be rusted, it must be allowed to remain some time in the bath. Borax can with good effect be mixed with the salt. Metal "purified" by such an immersion is very susceptible to galvanic depositions, and can easily be coated with copper, zinc, tin, nickel, silver, etc. For iron, in the spongy or powdered state, as obtained from the reduction of the ores, the salt bath is especially adapted, for it augments the combination of the particles by making their surfaces free from impurities. To prepare the bath for an application as here proposed, the salt must be fused in a puddling furnace, and the iron sponge, with the addition of a flux, be added in small quantities so as not to vitrify the salt. The iron is left in the furnace till the flux has combined with all the impurities and formed a slag, whereupon the iron is taken out and forged together. While the iron is in the furnace, it should be constantly covered with the salt, so that oxidation be prevented. For the hardening of iron, the salt is fused in a convenient vessel and the object immersed and from time to time a small quantity of ferrocyanide of potassium added, one or two pounds per 100 pounds of iron. The articles, according to their thickness, are permitted to remain from five to 30 minutes in this bath and are then plunged in water containing, in 100 parts, one part of hydrochloric acid, five of wine vinegar and one of salt. If the objects are to have a silver luster, they should be immersed for a few minutes in a mixture of three parts wine vinegar and one of hydrochloric acid.

PRIZE FOR STEAM WAGON.—Pennsylvania now promises to take her place in the list of States which offer a reward to the inventor of a successful steam road wagon. We read in the *American Manufacturer* that it is proposed, in a bill presented to the Pennsylvania Legislature, and now in the hands of the proper committee, to pay a premium or reward of \$10,000 to any citizen of the State who shall, within 10 years, construct upon plains of his own, and place in practical operation on the common roads, an engine or locomotive, propelled by steam power. The test required is that the engine shall propel itself a distance of 200 miles in a continuous direction, at an average speed of four miles an hour, and draw at least one vehicle carrying a weight of one ton. The construction of the apparatus is required to be such that it will conform to the track of the common wagon, turn out readily to pass other vehicles, ascend or descend grades of at least 300 feet to the mile, and apply power to at least one set of wheels on each carriage of the train designed to be drawn.

STEEL INSTEAD OF BRONZE.—The officers of the royal gun factories, says *Iron*, have been informed that the French government has resolved to discard its present system of bronze field-guns and make its guns of steel rings, puddled and cast. It has been under the consideration of the French artilleryists to adopt the English system of built-up, wrought-iron coils, including the muzzle-loading principle; but this would have required a new and extensive plant of machinery, whereas the transition from bronze to steel can be effected with very little trouble and expense, the substitution of a different metal being almost the only change. The preference of the French for breech-loading cannon is to be gratified by the application to these guns of the "screw relieve," or French system, and two kinds of field-pieces are to be produced—one rather larger than the English 16-pounder and the other somewhat smaller than the English nine-pounder, corresponding in size more nearly to the German than the English artillery.

CAST-IRON GLAZED TILES.—The *Deutsche Allgem. Zeitg.* says: At the iron works of Grodzitz, near Riesa, Germany, glazed cast-iron tiles for roofing are now made. They are not heavier than ordinary tiles and are very strong. The railroad depots of Loebau and of Reichenbach, and of many private houses of Hamburg and Dresden are roofed with them.

SCIENTIFIC PROGRESS.

New Genus of Lumbriculidæ.

At the last meeting of the San Francisco Microscopical Society, Dr. Gustav Eisen called attention to a new worm, about 20 inches long, which he had discovered in an irrigation ditch in Fresno county. His remarks were illustrated by exquisite drawings. The worm was a member of a new genus of *Lumbriculidæ*, which family had hitherto not been known to exist outside of Europe. Of this family, only five genera were previously known, viz.: *Styledrilus*, *Lumbriculus*, *Rhynchelmis*, *Phreatothrix*, *Trichodrilus*. The new genus added to the list was *Acerodrilus*.

Lumbriculidæ differs from all other families of *Oligochaeta*, in having four efferent ducts in the segment. *Stylophile* and other families had only two ducts in the same segment. From the genera in the same family, *Acerodrilus* is most remarkably distinct, nearly all its organs showing characteristics which even would place the genus in a new family. As very little is known of the anatomy of the *Oligochaeta* or earth-worms, every contribution is valuable and interesting.

In all other genera of *Lumbriculidæ* the ventral vessel is divided in some of the anterior segments; in *acerodrilus* the same vessel is entire. In all other genera of *Lumbriculidæ* the dorsal vessel is entire. In *Acerodrilus*, on the contrary, said vessel is divided in three branches, all three connecting in every segment with each other and with the ventral vessel. The alimentary canal is in the *oesophagus*, furnished with two large sack-like appendices, not met with elsewhere in this order. In the eighth and ninth segments, we find two pair of large pulsating hearts. In the other genera no hearts are met with.

Two pair of minute testes are found attached the dissepiments in the eighth and tenth segments. In other genera the testes are seldom found in pair and always very large, often filling a large part of the body. The ovaries are situated in the eleventh setigerous segment, and the oviducts, which, contrary to what is generally the case, are very large in the thirteenth setigerous segment. The efferent ducts are from the upper quarter, grown together, and at their lower end not furnished with any prostatic glands; neither do they enter a common atrium, which is elsewhere always the case. But the most remarkable characteristic of *Acerodrilus* is that the efferent ducts and the receptacle opens into the same external pores into the sixteenth segment, a fact not elsewhere met with. The receptacle, which is extraordinarily long, extends from the sixteenth to the twenty-fifth segment and sometimes further back.

Besides *Acerodrilus*, the Doctor has also found a species of each of the genera *Lumbriculus* and *Rhynchelmis*, the former in marshes in Sierra Nevada, the latter in the old mountain lake, near the Marine hospital, San Francisco. Besides, the Doctor thought that many new and interesting worms could be discovered in the many lakes and ponds of California, and called the attention of the members of the Society to the value and interest of even the smallest contributions, which he would most thankfully receive.

CONVERSION OF MOTION INTO HEAT.—M. Oliver gives, in the *Journal des Debats*, the following accounts of his interesting experiment in the illustration of the conversion of motion into heat: One end of a square bar of steel is held by one hand in the middle, and pressed strongly against a rapidly revolving emery wheel, by which means the extremity so applied becomes considerably heated. The hand at the middle of the bar does not feel any change of temperature, but that at the other extremity is soon obliged to let go, the temperature rising to the point of burning the skin. This effect, which appears paradoxical at the first glance, is thus explained by M. Oliver: The heat that burns the hand is not generated at the other extremity of the bar and transmitted thence, but is produced directly at the place; movement and heat being synonymous; the movement destroyed by the hand at the outward extremity of the bar by the stoppage of the vibration is converted into heat, while, there being an interval of repose at the middle of the bar, no heat is perceived at the time. A curious feature of the experiment is that at the outer extremity the thermometer does not show any exceptional temperature, because the thermometer does not stop the vibration. To produce the burning effect, the hand should grasp the end of the bar with force enough to arrest the movement.

CLIMATIC CHANGES.—It would seem that not only is the climate of Iceland growing so cold that grain cannot ripen there, but that of Scandinavia and western Europe is becoming more severe. This is due, it is supposed, to the steady descent of the ice of the far north upon the shores of Iceland. It has been ascertained that the temperature of Greenland was once much more mild than at present. Plants have been discovered in a fossil state there which cannot now show a sign of life. In the Atlantic, also, ice has been found much further south than formerly. Is another ice age slowly making its approach?

The Liquefaction of Oxygen.

One of the most interesting of late advances in chemistry is the forcing of oxygen to take a liquid form. This has been done before with several other gases, and now we have but hydrogen, nitrogen and some of their compounds left in gaseous form. The achievement with oxygen was accomplished by a Frenchman, Raval Pictet, at Geneva, Switzerland, on December 22d, and at once telegraphed to Prof. Tyndall. The liquefaction of oxygen was accomplished in this way: By a double circulation of sulphurous acid and carbonic acid the latter gas, as is well known, is liquefied at a temperature of 63° of cold under a pressure of from four to six atmospheres. The details of the experiment are then as follows: The liquefied carbonic acid is led into a tube four meters in length; two compound-action pumps make a barometric vacuum in this acid, which solidifies, owing to the difference of pressure. In the interior of this first tube, containing the solidified carbonic acid, passes a smaller tube, in which there circulates a stream of oxygen. The oxygen is yielded by chlorate of potash in a strongly made cylindrical generator with egg-shaped ends. The generator will resist a pressure of 800 atmospheres. On the morning of the 22d the apparatus as described was put in proper trim, and when the pressure reached 300 atmospheres a jet of liquid oxygen spirted from the end of the tube at the moment when the compressed and frozen gas passed from this high pressure to that of the atmosphere. The great interest of the experiment lies in the experimental demonstration supplied by it of the mechanical theory of heat, aiding as it does in the proof that all the gases are vapors capable of successive transmutation from the gaseous to the liquid, and from the liquid to the solid form.

The degree of cold is not mentioned in the above hurried report. From Prof. Tyndall's telegram it appears to have been 100° C.; the pressure in the telegram is given 320 atmospheres, not 300.

It is also claimed in Geneva that about a fortnight ago M. Cailliet succeeded in liquefying the binoxide of nitrogen, under a pressure of 146 atmospheres, at a temperature of 11° of cold, but the experiment is not fully authenticated.

SPONTANEOUS GENERATION.—An interesting series of experiments has been conducted in London, says the *Polytechnic Review*, to decide the question of spontaneous generation; that is to say whether vegetable or animal life can start into existence itself or whether all life is but the perpetuation of life already existing. Prof. Tyndall declares the question "practically set at rest for the scientific world" in the negative. His last experiment was on the Alps, he took with him from London, packed in sawdust, 60 flasks containing infusions of animal and vegetable matter, boiled to destroy all living organisms and sealed while the fluid was still in ebullition. The necks of six of the flasks were broken by accident, and were found filled with organisms. The other 50 remained for six weeks perfectly clear and pellucid. Twenty-three of the flasks were then opened in a hay loft. The other 27 were opened at a high elevation, and on the edge of a precipice, where the air was absolutely pure and free from "spores." The two groups were then placed in a warm kitchen. The 27 flasks opened out of doors remained pure, and without any indication of microscopic life. Of the 23 opened in the hay loft 21 were instinct with life, and filled with darting, dancing minute forms. Two of the 23 remained clear.

A PHYLOXERA EATER.—The London *Farmer* says that at a recent sitting of the Paris Academy of Sciences a letter was read from M. Lalliman, in which he describes a larva or grub which had been seen to devour 94 phylloxera in the course of 10 minutes. He proposes for it the name of "Phylloxera cannibale." M. Balbini says that the larva belongs to the genus *Syrphus*, or some closely allied one, but declines to classify it more closely until he has seen the perfect insect. The larva destroys the phylloxera by seizing upon it and sucking out its fluid contents, and this maneuver it repeats until satisfied. Repetition is not readily reached it appears, for it thinks nothing of 12 dozen victims for a mere early breakfast.

ANT IN AMBER.—At the late meeting of the Microscopical Society, Mr. Woodward exhibited a fine specimen of mounting, performed in nature's laboratory, in the way of an ant in a piece of amber. This relic of cretaceous life had the good fortune to drop himself into the fluid resin as it escaped from the amber-fir, one of the conifers of that age; and thus embalmed, was preserved in the same manner objects are now mounted in Canada balsam, and when placed under a two-inch objective, was found to be perfect in detail as well as general form. It was fixed in a slide by Mr. Kinne, and placed in the cabinet for future examination.

NORTHERN EXPLORATION.—The Dutch are fitting up a vessel to engage in the exploration of the waters of Spitzbergen and Barentz next summer. Recent discoveries in these waters make it probable that this expedition will have a commercial value.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

AMADOR.

ANOTHER BREAK IN THE BIG DITCH.—Amador *Dispatch*, Jan. 26: We learn that another very serious break occurred in the Amador canal, last Tuesday, near Bald Rock. About 100 feet of the embankment was carried away.

THE DUNNING MINE.—The new quartz mine belonging to Mr. W. S. Dunning, near the Monterichard, still continues to yield rock of remarkable richness. We were shown several pieces of rock taken out a few days ago which were thickly studded with large chunks of free gold, fully as rich as any heretofore taken out.

DOWNS' MINE.—Amador *Ledger*, Jan. 26: This quartz claim is situated about one mile above Volcano, and owned by R. C. Downs, of Sutter Creek. The ledge was explored many years ago to the depth of 90 feet, and some very rich rock taken out, the ore yielding somewhere near \$50 per ton. For some cause work was abandoned, notwithstanding the flattering results obtained. Work was resumed lately by Mr. Downs. The shaft is now 130 feet deep. At this depth a drift has been run some distance, and the ore body at the breast shows four feet in thickness. The rock looks remarkably rich, showing lots of free gold.

KENNEDY.—The first clean-up of this mine since the resumption of work was made last week. The mill had been running for only three weeks, with intervals of idleness during that time. The haulion sent to San Francisco is roughly estimated at \$2,000. This sum will give an average yield of about \$5 per ton. While this cannot be called a good yield, still it more than covers expenses, and that is something to boast of in the history of the Kennedy for the past few years. A yield of \$5 per ton will place the company on a prosperous basis, and ensure the continued working of the property.

HUNT'S GULCH.—There has been considerable prospecting for quartz in this locality, which is close to the Mokelumne river on the Amador side. W. A. Neville is still plodding along on the Spanish Gulch claim. He has two or three men employed in running a tunnel in the richest part of the ledge. The indications are that this is a pocket mine. Large quantities of gold have been taken out of spots; while the quartz in places is found to be barren. The Gwin mine, on the Calaveras side, is of this character, the gold being met with in patches. Analogy favors the conclusion that there are claims of equal wealth on this side of the river.

PHENIX DITCH.—There is now flowing through the Phenix ditch about 250 inches more water than is required to run the mill. The Davis and Bonanza mills are to be run by water from the Phenix ditch. The first named mill started up last week. The strike in north shaft of the Phenix is believed to be very valuable, as it solves the hitherto doubtful question of a continuous ore-body running through the mine. I am informed by the Superintendent, W. T. Jones, that the ore in sight is sufficient to run the 80 stamps for the next three years.

The large building over the shaft of the Summit mine, above Sutter Creek, was completely wrecked by the storm last week.

BUTTE.

THE MINING BOAT.—Oroville *Mercury*, Jan. 26: Last Sunday, parties were at work on the mining boat, trying to float it down the river to a place opposite the Lava Beds. The boat is 100 feet long and 40 feet wide, and had on deck two engines and a large sucking tube. The workmen could only let it go foot by foot, as the water ran at the rate of 20 miles per hour. While thus at work, the cable broke and the boat plunged headlong down stream, but went only a short distance when it hit a rock, knocking a hole two feet in length in the boat and sending the sucker overboard with a tremendous crash. One man had three of his toes cut off by the accident and others came near being injured.

CALAVERAS.

MINE SOLD.—Calaveras *Citizen*, Jan. 26: We are informed that the Tiger mine, situated near Rich gulch, in this county, and principally owned by C. H. Livingston, of Columbia, has been purchased by Ira L. Ramsdell, of San Francisco. The price paid Mr. Livingston for his interest was \$11,500. He says that Mr. Ramsdell is calculated to manage the property successfully and that the Tiger will undoubtedly prove a profitable investment.

MOSQUITO ITEMS.—Calaveras *Chronicle*, Jan. 26: Everything is progressing favorably at Mosquito. At the Blue Jay, Potter, Rodgers & Spaulding are taking out richer rock than ever from a five-foot lead. The rock fairly glistens with the precious metal. The new engine and hoisting works at the San Bruno are just completed, ready and capable of sinking 1,000 feet. Holmes' mine is progressing under favorable circumstances. At the Banuer they are pushing ahead in the south level. The lead is widening and getting richer. At the John the Butcher mine they have at last struck the lead, and a good looking one at that, gold being visible throughout the rock. The Greenhorn is being reopened under the superintendency of Dave Lampson, with Thomas Miner as foreman.

EL DORADO.

NEW AND VALUABLE DISCOVERY.—El Dorado *Republican*, Jan. 26: Andrew Eliott, one of the oldest and most extensive prospectors on the coast, both in this State and Nevada, brought to this city, on Monday last, specimens of rock that were exceedingly rich in gold, silver and copper. His claim is located about 25 miles from here, and he claims that by far it is the most promising mining claim that he has ever seen and that he believes it will be the means of working a complete revolution in the mining interest of this county. G. W. Swan has the specimens referred to and will take them to San Francisco, for exhibition and assay, next week.

G. W. KIMBLE, near Gold Hill, struck another rich pocket, a few days ago, on his claim. We have been unable to learn how much he realized from it, but are assured that he took fully \$50 from the first pan after putting the pick into it. He has made several rich strikes of the kind heretofore, and several others, within a radius of about as many miles, have taken out large amounts.

INYO.

SANTA RITA.—Coso *Mining News*, Jan. 26: Work is about to be resumed on the Santa Rita mine, Mr. Green, Acting Superintendent, having received orders to proceed at once.

FURNACE.—Mr. Joseph McEvoy, of the El Monte mine, having extracted some 300 tons of good ore, is endeavoring to lease the Santa Rita furnace to have same reduced.

NEW FINDS.—Several new finds of silver ledges have been reported to us this week, but we have not had time to examine the ledges, although they are situated but a mile or two from Darwin.

NEW COSO FURNACES.—We understand that the furnaces of the New Coso company will be running within the next two weeks.

BETTER TIMES.—Times in Darwin at present are very dull, but if the companies operating here spend but one-half the money that has been levied and collected lately, we may look for a lively business revival before many weeks. Over \$480,000 in assessments have been levied, and, we presume, collected within the past three months.

GOON ORE.—Humphrey & Co., who have been quietly prospecting their mine—the Eureka, situated about one mile from Darwin, just below the Defiance—for a long time, had assays made, last Thursday, of the ore taken from the bottom of the shaft, at a depth of 214 feet, and the ore went as high as \$1,614 per ton.

EMIGRANT.—The bullion shipped, to-day, by the Emigrant company, amounts to 150 pounds, valued at \$3,000. Total for the month, to this date, \$6,150. Mr. Taylor came in with the bullion, and says everything is going along very nicely, the ore bodies looking well.

CERRO GORDO.—*Courier-Californian*, Jan. 26: The Beaudry furnace, of the Union Con. company, is making a steady output of 125 bars per day of probably the richest base bullion now produced on the coast, mainly from high-grade silver ore coming from the San Felipe. The lead mines yield only sufficient ore to furnish the necessary flux and keep the one furnace in operation.

MENDOCINO.

GOLD MINING.—Mendocino *Democrat*, Jan. 26: The Mendocino gold mining company, of which T. L. Carothers, Esq., S. Wurtenberg and Mr. Quinliven are members, and the field of operation of which is at Calpella, washed up \$27 in gold, Tuesday, and, we are told, with plenty of water, will make a much better showing. Wurtenberg tells us quite a lot of gold was taken out of there a number of years ago, of which he has specimens now.

NEVADA.

AT WORK.—Nevada *Transcript*, Jan. 23: Most of the mining claims at You Bet are in full operation, and the prospects of taking out a large amount of gold are most excellent.

GOLD HILL MINE.—Grass Valley *Union*, Jan. 24: We cannot confirm the report of a rich strike in the Gold Hill mine, but can say that they have found good gold-bearing rock on the floor of the south drift on the 350-ft level, where heretofore nothing very encouraging had been found. The general appearance of the mine is favorable, and all indications point to good development.

ROCKY BAR MINE.—The first clean-up of ore from this mine, under the new organization, was made this week, and from 155 loads they received 619½ ounces of retorted gold, valued at \$10,531.50, or about \$68 per load. Besides this there were sulphurets, which, when worked, will increase the total several hundred dollars more. Specimens of the value of \$226 were selected from the above rock before crushing. The company have out 50 loads more of as equally good ore, and that which is being daily taken from the mine is of the same excellent character. This is a splendid result, and very encouraging to the company, giving them assurance that their purchase was a good one. This rock was taken out at a depth of from 100 to 120 feet. Everything about the Rocky Bar gives encouragement for the development of a rich mine, and the shareholders are in the best of spirits over the rich development that has been made.

PLACER.

DAMAGE TO DITCHES.—Dutch Flat *Forum*, Jan. 24: The high wind that prevailed on the 16th was the cause of doing considerable damage to the ditches in this vicinity. The South

Yuba ditches were broken in a number of places by the falling of trees, the repairing of which caused a delay of several days. The Miners' ditch was but little interrupted by the falling of trees, but sustained considerable damage by the blowing down of 36 boxes of a branch flume between here and Gold Run—standing on high trestle work—built for the purpose of conveying water to the Illinois mine. The Cedar ditches sustained but little damage. The flumes and pipes of the Little York ditches were considerably damaged. Several boxes of fluming, standing on high trestle work, immediately above Camel's Hump, were destroyed by the falling of trees, and 600 feet of the large iron pipe between Camel's Hump and Little York—also standing on high trestle work—were blown down. The pipes are considerably damaged by being bent and separated in places.

THE MOUNTAIN GATE MINE.—Placer *Herald*, Jan. 26: The old Mountain Gate mine at Damascus, one of the oldest drift claims in the country, having been opened in 1853, and now in some 7,000 feet, has been running rather light for some time past. Lately, however, they have struck gravel that is equal to the best ever taken out of that mine, and the stockholders, as a natural consequence, are feeling much revived in spirits. Where they are working at present the gravel pays at the rate of an ounce to the carload, and only last week the result of three men's labor aggregated \$360. The mine is owned by some 20 or 30 men who do most all the work themselves, and when they can realize from \$100 to \$120 a week each, they certainly have a good thing.

SAN BENITO.

QUICKSILVER.—Hollister *Enterprise*, Jan. 26: W. W. England exhibited in our office one day last week one of the richest and finest specimens of quicksilver ore we have seen for a long time. It was taken from the Mariposa mine, located in the Coast range, a short distance east of Hugh French's place. The claim is owned by Lige and Morey Stayton, D. England and Thos. Reed. The proprietors have run a tunnel some 40 feet, at which point they struck the lode from which the sample of ore in question was extracted. They have a number of tons of excellent ore on the dump, and plenty more in sight in the mine.

SIERRA.

STARTED.—Mountain *Messenger*, Jan. 26: The Sierra Buttes M. Co. have started a few stamps, but have not water enough to run any great number.

B. M.—We are informed that the Bald Mountain Co. have put about 40 men at work since water came.

SUMMIT.—There is from four to five feet of snow on the summit between Gold valley and Gold lake.

BUSINESS.—The owners of the Johnson quartz ledge, near Monte Christo, are pushing work, and will reach the shaft before long. They have fine quartz at the bottom of the shaft and a large ledge.

RUNNING.—The quartz mill at the Brush creek mine has been running about two weeks on rock taken principally from the upper levels. The rock is not considered very rich, but it is thought it will pay for crushing.

GOON WORK.—Messrs. Foss and Thompson have completed 190 feet of the tunnel to tap the Wilbourn Con. M. Co.'s ground. They have been at work about six weeks.

AT WORK.—We are informed that the Pliocene Co. are still at work sinking their shaft, using a tub to keep the water down.

TUOLUMNE.

MINERS UP AND DOING.—Tuolumne *Independent*, Jan. 26: A copious supply of water is flowing in the T. C. W. Co.'s ditch, the results of the recent storm, which high up in the mountains was rain instead of snow, as might be expected, at this time in the season. The miners in the vicinity are making the necessary repairs to flumes, tail-races, ditches, etc., preparatory to operating their respective claims. Mr. James Barron, who has erected a hydraulic elevator on his claim at Yankee hill is pushing the work forward to a final completion of all the details in readiness to commence washing. We learn that the only obstacle in the way of putting his elevator to work is the ditch which conveys water from the T. C. W. Co.'s ditch to the pipes that supply the giant and the elevator, it is in such condition he will not be able to run water on his claim until Monday next. The ditch was constructed last fall; a great portion of it is in a loose sandy state, which causes breakages and loss of water by leakage, to that extent that it will take three days more to put it in order for carrying a sufficient volume of water to operate with in the claim. It will require several hundred inches of water to operate upon the plan on which the claimants propose to work the claim. So we understand next Monday is the day fixed for the great event of putting in operation the first hydraulic elevator erected in Tuolumne county. It will be a notable event. If the machine can be operated successfully on Barron & Co.'s claim, it can likewise be employed to advantage and with profit in many localities in the county.

The miners about Columbia have now an abundant supply of water, and the gravel claims above are commencing operations.

Nevada.

WASHOE DISTRICT.

CALIFORNIA.—Gold Hill *News*, Jan. 30: Daily yield, 700 tons of ore, keeping the mills all crushing up to their full capacities. The ore

breasts on the 1500, 1550, 1600 and 1650-ft levels all show well and continue to yield the usual amount of rich ore.

CON. VIRGINIA.—Daily yield, 650 tons of ore. The mills are kept steadily running and the yield of bullion for the month of January will exceed that of any previous month for some time past. The ore breasts in all parts of the mine, from the 1200-ft down to the 1650-ft level, continue to yield their usual quotas of rich ore.

LADY WASHINGTON.—The main drift south on the 850-ft level is being pushed forward energetically to its connection with the drift being run north to meet it from the 1000-ft level of the Justice. The connection will be completed in the course of a week, when crosscutting will be commenced.

TROJAN.—Fifty tons per day continue to be the regular yield of the mine, and the ore stopes and breasts show no signs of giving out.

BULLION.—The north drift on the west side of the ore vein on the 1700-ft level is steadily advancing along the clay wall, and the east side of the drift showing a fine body of quartz of low grade. The face of the east cross-drift on this level, which was stopped a short time since, on account of a strong flow of water, shows beyond a doubt that the eastern limit of the ore vein on this level has never yet been reached.

OPHIR.—The west lateral south drift from the 1900-ft station is being advanced but slowly on account of the strong flow of water and the fearful heat. There is about 12 inches of hot water flowing from the drift in the face of which, in spite of all the air that can be forced in, the temperature of the air is 110° to 120°, while back in the drift, a short distance from the face it shows a temperature of 142°.

NORTH CON. VIRGINIA.—The face of the west drift on the 1300-ft level appears to have penetrated the hard country rock in which it has been running and is passing into a much softer formation of vein porphyry.

UNION CON.—On the 1600-ft level the course of the north drift has been changed from the joint Sierra Nevada winze to a nearly northeast direction, and if continued far enough in that direction, will, in time, connect with the North Con. Virginia shaft. Surveys lately made, and a thorough comparison of the results of the prospecting done heretofore, show, beyond a doubt, that all the prospecting done has been too far to the westward.

BELCHER.—The south drift on the 1900-ft level is making good progress. The west cross-cut on the same level, running to tap the water in the south incline, is also making good headway.

JULIA.—The new double hoisting engine was started up on Sunday last and works splendidly. The incline is now down 100 feet and the sinking now will be greatly accelerated by the use of the new engine in hoisting.

HALE & NORCROSS.—The pumps work splendidly and as steady as a clock. Owing to some disarrangement at the Savage during the past 48 hours, they have had the water to hold in check single handed, which duty they have performed in a first-class manner.

OVERMAN.—The south drift on 1400-ft level, running to connect with the Caledonia north drift, is being pushed vigorously forward and will probably complete a connection some time during the coming week.

SAVAGE.—The straps were put on the V-bob, yesterday, and the rear anchor bolts secured. The pump-rods are all in place and the entire pumping machinery from top to bottom has been overhauled, placing everything in first-class condition to again start up.

JUSTICE.—Daily yield, 80 tons of ore, keeping the Pacific mill crushing to its full capacity. The winze connections on the ore vein from the 700 down to the 1150-ft level has been completed, and a large amount of good ore stripped ready for extraction. The ore stopes on the 1150-ft level, going north, are widening out, and show a large amount of rich sulphurets ore.

SILVER HILL.—The east drift on the 800-ft level is showing some very handsome quartz and low grade ore in the face. Crosscut No. 2 from the south drift on the 600-ft level is also showing some very favorable streaks of ore.

YELLOW JACKET.—On 2200-ft level the main drift east toward the new shaft is now out 775 feet from the winze; the face continues in the same hard, dry ground. The crosscut west from the main north drift is in 105 feet and is running in quartz and porphyry. The crosscut east is in 90 feet and the face is in very favorable vein matter.

UTAH.—The south drift on the 1350-ft level is being pushed vigorously forward, the face in soft easy working vein matter.

MEXICAN.—The east joint crosscut on the north line is in quartz and porphyry mixed, which looks very favorable. The east drift from the bottom of the joint Ophir winze on the 1900-ft level is making fair progress, the face being in hard blasting rock.

BEST AND BELCHER.—East crosscut No. 1 on the 1700-ft level is being cleaned out and repaired preparatory to commencing a winze to prospect the vein in a downward direction at that point. This winze will be sunk perpendicularly.

GOULN & CURRY.—The foundation for the new air compressor is completed, and the whole will be in running order in a very short time. This compressor will add greatly to the ventilation and prospecting facilities on the lower levels when completed.

SIERRA NEVADA.—Sinking the double incline winze below the 1700-ft level is being pushed

forward with all the rapidity possible, the bottom being in good working ground, and the sinking progressing regularly at the rate of five feet per day.

CALEDONIA.—The rise of water occasioned by a recent breakage of some of the pumping machinery has been drained and worked resumed in all parts of the mine as before.

CON. IMPERIAL.—The north drift on the 2400-ft level, from the bottom of the south winze, is in a distance of 50 feet, the face in a fine character of vein matter mixed with quartz, which has a healthy look, and assays from \$8 to \$10 per ton.

CHOLLAR-POKOSL.—The flow of water is considerable, but is easily taken up and handled by the skews.

CROWN POINT.—Daily yield, 60 tons of ore from the old upper workings. The ore is being crushed by the Santiago mill at the rate of 50 tons per day.

SOLID SILVER.—The west crosscut from the main tunnel or adit shows improvement in the quality of ore encountered.

NEW YORK.—The bottom of the shaft is now all in quartz which gives fair assays, but not quite so good as were obtained a week ago.

SUTRO TUNNEL.—Total length of tunnel last evening, 18,819 feet. The face of the header is now in soft vein material.

SENATOR.—Negotiations are being made with Emmett, of the Gold Hill Foundry, to put the surface machinery of the mine in full working order as speedily as possible.

EUREKA DISTRICT.

MINING ITEMS.—Eureka *Sentinel*, Jan. 23 to 27: We shipped, last week, \$168,800 in crude bullion. The furnace pay roll of the Richmond company, during the month of December, amounted to \$12,000. The Richmond company smelted 3,600 tons of ore during the month of December. Another large cave was discovered in the Jackson mine, this week. It was broken into 60 feet below the 450-ft level and is filled with ore of a very high grade. Superintendent Shoehner informs us that steam hoisting works will be built at the Rescue mine at an early day. The Eureka ore dumps are filled to overflowing, both at the mine and furnace. The Eureka Con. company has disbursed \$950,000 in dividends in the last five months. Work is still being prosecuted on the Kit Carson mine. The property is opening out well. Large quantities of ore are daily shipped from the Connolly mine to the Richmond furnace. The value of the bullion yield of the Eureka Con., for the quarter ending December 1st, will aggregate \$950,000. Larry Hartnett, formerly chief engineer of the Savage mine, has taken charge of the new steam pumps at the K K Con. mine. Col. Taylor had a force of men at work, yesterday, cleaning out the flue at the Consolidated works. Over 500 tons of dust had accumulated in it. The rich strike in the Hamburg mine continues to hold out well, and the ore body in the winze on the 450-ft level is looking splendidly. The Eureka Con. company produced, during the quarter ending December 30th, 3,620 tons of crude bullion, or an average daily product of 39½ tons. The Richmond furnaces turned out over \$100,000 last week.

HUNTER DISTRICT.

CLOSED DOWN.—Eureka *Sentinel*, Jan. 26: The Hunter Con., Hunter district, of which property Mr. Dunne is Superintendent, is closed down for the present. The company's application for patents has been resisted, parties protesting thereto, and the company will not resume work until the question of title is settled.

WARD DISTRICT.

PROSPECTS.—Eureka *Sentinel*, Jan. 26: J. J. Dunne arrived in Eureka, yesterday, from Hunter district and intermediate points. He speaks in flattering terms of the mines at Ward, and is satisfied that next summer will witness renewed activity all along the line. He brought with him some rich specimens of ore from the Paymaster and Pleiades, taken from recent developments made in those properties. The main shaft on the latter is down 230 feet and the ore body at that point is four feet in thickness and of very high grade. On the first level a drift has been carried a distance of 180 feet, in ore all the way. The strike in the Paymaster is very encouraging and insures both the future of the mine and district.

WHITE PINE DISTRICT.

STRIKE IN THE JENNIE A.—White Pine *News*, Jan. 26: We learn that an important strike was made in the Jennie A mine, on White Pine mountain, the fore part of the week. At a depth of 350 a four-foot vein was struck, which is said to present a fine appearance. The Jennie people have now reached a depth never before attained in the base metal mines of this district, and the finding of a large and well-defined vein at such depth cannot but greatly encourage the company in the work of prospecting.

Arizona.

LIVE YANKEE.—Arizona *Sentinel*, Jan. 26: The Live Yankee gold mine, a few miles above Yuma, is now being opened up in a way to make it a valuable property. The mine lies close to heavy bodies of timber and within a few hundred feet of the Colorado river. It was worked and yielded nearly \$30 per ton; at that time that was too low a yield to create even a ripple of excitement and nothing more was done. But now there is a railroad within a few miles of the ledge, and if the boys can open up a good-sized body of \$30 rock, the mine has a big cash value.

PIONEER DISTRICT.—Late advices from Pioneer district report everything running quietly and regularly at the Silver King mill and elsewhere. Power's suits against the Masons have been compromised and withdrawn. Baldwin and others are to put up a five-stamp mill and concentrators on Queen creek, about a mile above Picket Post. Twenty tons of the machinery, etc., are due here next week. Two thousand tons of ore have been contracted for with Mr. John Dore.

The placers around Gila City are gradually attracting more attention, quite a number of men are now at work there and considerable gold is being taken out. Mr. J. Brown brought in a nice bag of dust from there last Thursday.

Mr. E. Power, of London, was here a couple of weeks ago in the interest of the English capitalists for whom Ogilby bought the Carga Muchacho mines from Van Arsdale. His visit has in some way dried up the litigation with which the outfit was slopping over.

Work is now well under way on the Genesee and Eureka Bonanza mines, of Eureka, next above Castle Dome district, under the auspices of San Francisco parties. Some ore is being taken out, but most of the work is being directed, toward opening up the mines. A pump has been rigged on the old shaft and is keeping down the water which formerly drove the miners out. There is quite a shipment here of material and supplies, which will be forwarded to the mines by first boat.

PECK DISTRICT.—Enterprise, Jan. 23: T. L. Edwards came in from the Peck last evening. He brings good reports of the mines, but says there is some dissatisfaction in the minds of Peck and Warrior miners concerning the non-appearance of paymasters.

HUMBURG DISTRICT.—Mr. Rowe, of the mercantile firm of Anders & Rowe, arrived here from Humburg district a short time ago. The news he brings is that Miles & Belcher have struck plenty of rich ore in the Julius lode, which is about midway between Tiptop and Swilling mines. The Tiptop company have contracted with Simmons & Monick for the packing of 1,500 tons of ore from their mine to the head of the wagon road, distance about four miles. Their mill is about 10 miles from the mine. The snow was melting, in consequence of which water had commenced running in creeks and gulches.

Idaho.

GOLD HILL MINE.—Idaho *Statesman*, Jan. 26: Mr. C. E. Clark, brother of Hank Clark, of Horseshoe Bend, called on us Thursday. Mr. Clark is one of the efficient workers employed at the Gold Hill mill in Boise county. He says the company are now working a force of 60 men. The 25-stamp mill is pounding away day and night on good ore, crushing at the rate of 50 tons per 24 hours. The ore from the lower level is steadily improving in quality with a sufficient quantity in sight to run the mill for several years to come; but the company have determined to penetrate the mine to a depth of 100 feet below the present lower level with a perpendicular shaft, which is now down 125 feet below the first level though the shaft does not follow the direction of the ledge, it is nevertheless passing through ore seams which increase in width and richness as it progresses. The mine has been demonstrated to be a true fissure vein, and there is every indication that all the scattered and interrupted seams will unite below in a continuous body of rich ore. This mine has been worked for several years with constantly increasing profit to its enterprising owners. As to the yield per ton no estimate can be had, but as the owners are prosperous from the yield of the mine, while the scale of operations is large and the expenditures great, it may be taken for granted that the returns are in proportion. This is a mine upon which no borrowed capital has been used, no assessments levied, and whose expenses are promptly and punctually liquidated, thousands of dollars being disbursed for labor and material every month.

POTOSI.—Owyhee *Avalanche*, Jan. 26: Operations were resumed at the Potosi on Monday last under the direction of one of the leading merchants of this city, who is largely interested in the property.

At the Black Jack the shaft is down a depth of 125 feet. In both stopes on the first level the ledge has a splendid complexion and much rich rock is being taken out.

Work was resumed on the Leviathan mine on Florida mountain yesterday, and a considerable quantity of good ore will be sent away from there in a few weeks.

Montana.

PHILLIPSBURG ITEMS.—Cor. Butte *Miner*, Jan. 26: I found Phillipsburg very prosperous, the Northwestern and Hope mills both running and turning out plenty of bullion, while the ore in sight at the Trout and Hope mines is amply sufficient to keep them running for a long time to come. It is safe to say that Phillipsburg never shows such evidences of permanent prosperity as now. The Trout mine is developed by shaft to the depth of 327 feet, with many hundreds of feet of drifts, levels and inclines, from which many tons of ore is being taken with a very small force, and at very small cost. There is a splendid showing of ore in nearly all the openings. No mine in Montana has passed through a more trying ordeal than the Trout, and none have come out more triumphant. Being more than 100 feet below the head of Trout creek, and still in good ore, the hueghar of the water level doesn't frighten anybody. The ore

vein, although continuous, is like all deposits of ore in lime, very irregular. It occurs in chambers, some of which are very large, but whether large or small the ore produced is always very rich. I think it would be very hard to find ore more refractory than that taken from the Trout, and yet Mr. Speckart seems to have no difficulty in extracting the silver to a very high percentage of its assay value.

News in Brief.

The schooner *Sarah A. Owens* was wrecked off Mendocino, on the 26th.

Hon. W. Z. ANONEY, Senator from Santa Clara county, died on Sunday night.

Geo. P. GORDON, the inventor of the Gordon press, died at Norfolk, on Sunday.

The House Railroad Committee seems favorably disposed towards the Texas Pacific.

The project to put certain banking houses on a gold basis is said to be strongly supported.

Since the Eastern war began the demand for sole leather from this country has greatly increased.

A SECOND unsuccessful attempt has been made to rob a train on the Atchison and Santa Fe railroad.

The Russians, Servians, Roumanians and Montenegrins are pushing military operations with great vigor.

The House Committee on Naval Affairs recommends an appropriation of \$50,000 for the Howgate expedition.

The Russian corvette *Craysser* Capt. Nascioff, is in port from Callao. She carries 18 officers and 120 men.

A NUMBER of army officers have been appointed on the commission to inquire into the recent Rio Grande troubles.

The steamer *Amador* is now on the ways at Oakland point, and is to be transformed into a double-ended for the Oakland ferry.

The yacht *Tidal Wave*, is stated in a dispatch to have been purchased from New York owners by D. Cook, of this city, at a cost of \$9,500.

The cigar makers' strike in New York has failed after four months' struggle. The men are generally seeking work again at the manufacturers' terms.

SEVERAL free lunch rooms for needy persons have been established in this city, and the result shows the necessity of even more of such institutions.

The French Academy of Sciences has awarded the Lalande prize of astronomy to Prof. Hall, the American discoverer of the satellite of Mars.

THERE has been considerable excitement in New Orleans, caused by the conflict of Federal and State jurisdiction in the trial of members of the Returning Board.

The Bank of San Francisco has ceased business. The depositors are already paid in full and it is stated there are enough assets to settle with stockholders.

The Emma mine case is to be revived at Chicago, Frederick A. Bragg suing for \$250,000, and \$1,000,000 damages. He alleges that Parks defrauded him in the sale to the English party.

GREAT excitement has been caused in San Domingo and Hayti by the rumor that Spain will soon sign a treaty assuming a protectorate over the islands. It seems to increase the unpopularity of President Baez.

A DISPATCH from the United States Vice-Consul at Shanghai, asking for funds, says: "An appalling famine is raging throughout four provinces of North China. Nine millions of people are reported destitute. Children are daily sold in the markets for food."

The ship *King Philip* was wrecked just outside the Golden Gate, on Friday last, and on the same day the ships *Western Shore* and *Don Nicholas*, came near being lost in the same place. Capt. Blinn of the *Western Shore* was killed by the parting of the tug's hawser in the effort to get the vessel off the lee shore.

The Pacific Mail Steamship Company have decided to double their carrying service between New York and Aspinwall, and Panama and San Francisco, in order to meet the present pressure of freights, which are represented as more than a semi-monthly line of steamers can accommodate. It is proposed to hereafter send out a steamer every week.

CAPT. EADS last week received a warrant for \$500,000 on account of his improvement of the South Pass of the Mississippi and securing 22 feet of water. He had previously received a like amount on the same service for 20 feet. He gets half a million for each additional two feet up to 30 feet, and then \$100,000 a year for 20 years, to keep it up to that standard.

OUT of the 300 persons who partook of a free lunch at Dr. Jewell's church Sunday, 35 signed the pledge to abstain from liquor, while at the Green Street church out of 200 who came to the dining table as many as 70 took the more general pledge that they would abstain from the use of liquor and tobacco and would not indulge in profane swearing or stock gambling.

The anti-subsidy resolution adopted in the House of Representatives by a vote of 147 to 85 declares that, in the judgment of the House, no subsidies in money, bonds, public land, endorsements, or by pledge of the public credit, should be granted to or renewed by Congress to associations or corporations engaged in or proposing to engage in public or private enterprises; but that all appropriations ought to be limited to such amount and purposes only as shall be imperatively demanded by public service.

THERE are 300 students at the State University at Berkeley.

LEW WING, a Chinese murderer, was hung at San Rafael, on Tuesday.

ADVANCES from Samoan group of islands state that the war there is ended.

CONCENTRATION of the Russians at Adrianople continues.

The Turkish government is having difficulty to maintain order in the Capital.

The labor agitation has subsided and the militia have retired from duty.

THERE are over 300 artesian wells in Santa Clara valley, Cal.

An immigration agency for Washington Territory has been established in this city.

The citizens of Berkeley are agitating the subject of incorporating the town.

The Shah will soon start on another traveling tour through Europe, this time incognito.

The wine crop in France for 1877 proves to have been a fair average one of good quality.

It costs \$160 to reach the Black Hills from San Francisco, and the passage consumes about six days.

At Santa Cruz, on the 28th, the blacksmith's shop and storeroom of the Felton Railroad Company were burned.

The Garka rebellion (Africa) is spreading and its suppression is improbable before the arrival of reinforcements from England.

HENRY MILLER, Vice-President and one of the firm of the bank of D. O. Mills & Co., died on Tuesday at his residence at Sacramento, aged 71.

The *Call* has a new Hoe press on the way from New York which will print 30,000 copies of the *Call* on both sides and deliver the same ready folded for the carrier in an hour. The *Call* has also on hand a new dress of type.

Those deeply interested say the President declares he will not ask the present Congress to make an appropriation to pay the \$5,000,000 awarded to Canada by the Fishery commission.

The grand jury of Jacksonville, Florida, have found indictments in 17 cases against alleged timber predators in that State, involving immense values in lumber, timber, tar, turpentine and resin.

The *Caroline Melau* cleared, on Saturday, on a wrecking and fishing voyage, her cargo consisting of a lot of machinery and apparatus, to be used for wrecking purposes at the wreck of the steamer *City of San Francisco*.

DURING the past week the receipts from internal revenue in this district aggregated \$58,033, of which \$38,860 came from semi-annual taxes on bank capital and deposits, and \$13,013 from tobacco, cigars and beer.

COLONEL BEE has received a number of orders for Chinese laborers recently from the Eastern States. A coal mining company in Missouri has contracted for 500 coolies to work in the mines, and another order for 200 comes from Arkansas.

CALIFORNIA street, between Kearny and Powell, has been washed out to such an extent by the recent rains as to delay for an indefinite period the putting on the cars of the California-street Wire Railroad Company.

A ROMAN dispatch says: The Pope is preparing an allocution against Russia for the persecution of the Church in Poland, and against King Humbert and his accession to the throne for the assumption of the title of King of Italy.

An attempt made at Montreal, on Monday, to blow up the Canadian Institute building, was averted by the timely discovery of an explosive package in the main hall. This is the Institute which Guibord joined and for belonging to which he was excommunicated.

The Postmaster-General has issued an order that the regulation of the Department relative to local papers at letter carrier offices, is modified so that paragraph six shall read "weekly newspapers to transient parties, one cent each, to be prepaid by postage stamps affixed."

LORD DREBY, telegraphed to Lord Loftus, British Ambassador at St. Petersburg, January 28th, states that Count Schouvaloff that afternoon communicated a telegram from Prince Gortschakoff, authorizing him to affirm categorically that the Russian government considered the passage of a man-of-war through the Dardanelles and Bosphorus a European question which they did not intend to settle by themselves.

The New Bedford *Whaleman's Shipping List* says that the North Pacific whaling fleet was very successful the past season. The catch was small until September, when whales were found plenty and large fakes were taken. Three vessels were lost, and 16 vessels came out with an average of 1,065 barrels of oil, and 8,550 pounds of whalebone.

ACCORDING to the table prepared by H. C. Hoyt, the marine reporter of the Merchants' Exchange, 22 vessels in all were built on the Pacific slope during 1877. There were 6 scow schooners built, ten schooners, one bark, one harkentine and four steamers. The aggregate tonnage was 3,640 tons. The cost of steamers complete was about \$195,000; of sail vessels complete about \$250,000. Total, \$440,000.

The Sutter claim, which has been before several Congresses, was considered by the Private Land Committee. Sutter claims to be the original discover of gold in California. His claim is for lands that have been granted him by the Mexican Government before California was acquired by the United States. The Committee of the last Congress reported favorably upon the claim giving him \$50,000 in lieu of his claim, but the Senate did not consider it.

Prospects in Arizona.

We are requested to say something about the prospects of this country for the coming season. Well, they appear to us to be "bully." If we were writing to our kin—say Uncle Robert and Aunt Rachel, or to anyone of their 14 or 15 sons and daughters, who are our dear cousins—we should probably tell them as near the truth as we knew how, and this is about what we should say: "Times have been a little tight for two years past, we must confess, and occasionally some of the people get tighter than the times; now and then one gets 'tight as a brick.' Your respected cousin, however, maintains his equilibrium, and is, if anything, a little 'loose,' not so much in his morals as in his habit of doing a large amount of labor without exacting adequate compensation. This, however, is the natural outgrowth of a great moral reform, a revival, so to speak, which always follows in the wake of civilization, and tones down prices as well as society. The pioneers of all new countries are apt to strike a high key, run business on the high pressure system, and have a good, free and easy time of it until the Moodys and Sankeys and Hammonds and Van Cott's, of trade, as well as of morals, find their way into the wilderness, and overturn the pioneer system of business first, of morals afterwards, and finally we find ourselves assimilated with the great mass of mankind throughout the world; the mining camp of the mountains is scarcely less or more than a New England village, and the pioneer is again ready to pick up and move on to find another wilderness."

These are some of the prospects of which we should write to our kin, with the secret hope, perhaps, that they would not like the picture, and would stay at home, but there are other and more tangible indications of coming prosperity that ought not to be entirely overlooked. Within the year several new mining districts have been opened in Arizona, and a large number of important mining enterprises started, some of which are already in successful paying operation, as the Signal and others, and a number are just on the eve of starting their works, as the Tiptop, Black Warrior, McMillen, etc., while a greater number are developing with a view to putting up works, as the Tiger, California, Little Mack, and hundreds, almost, the names of which we do not call to mind at the moment.

These, with the already successful works, before the beginning of the year that is just passed, as the Peck, McCrackin, Hackberry, Silver King, etc., give assurance of pretty fair times ahead. And so on this account, we should intimate that, while it might not be just the thing for the heads of families to sell their farms and rush off to Arizona, yet, if any of them should have a few thousand dollars to spare, it would not be a bad idea to fit out some of their wives' younger brothers, and send them out here on a prospect. "What man hath done, man may do," and as men have found rich mines in this country, these young men would, at least, find a chance to "strike it big," and if they didn't, the country would have the benefit of the money spent, and this is another of the prospects of which we should write.

The country is full of prospects; of course they are not all bright, nor should they be; if it were so, it would beget monotony, and people would have a surfeit of brightness, perhaps an attack of "Bright's disease." The dark spots in the life of a prospector give zest to his occupation, and by contrast render the bright ones a thousand fold more attractive.

These are the prospects as they present themselves to us, "where we sit," as Waddy, the stage-driver used to say, and we give them to you as Gospel truth.—*Arizona Miner.*

Why Prospectors Seldom Get Rich.

Many who not familiar with mining, its drawbacks, its expenses, etc., wonder how it is that so few of our prospectors become wealthy. But it should be remembered that large expenses attend the opening of a mine, digging and blasting through solid rock, making openings for working and ventilation. When fully understood no one will ask why one person does not succeed. If his bank account is large enough he will. Look at the cost of the openings and machinery on the Comstock, the richest of the rich. Does anyone think that one individual could stand it? So it is with the prospector. He finds the mines, and as a miner knows he cannot go into the earth and open up the mine on a paying basis; he knows he must contend with hard rock, must timber, must open levels and air passages; he needs machinery to pump and to hoist, and then, after his ore is on the surface, what has he? A lot of rock containing precious metal, with a lot of base metals. This must go through a process of working that requires more machinery. He has no bank account, owes the tailor for his clothes and the grocer for his grub, and must sort out the best of his rock and sell it at a sacrifice to keep him in daily bread. Is it not wise to sell his claim for a few thousand dollars and return to his old home in the land of civilization? Yet how few do it. He cannot resist the love he has for the miner's life, the charm of being away from all the works of man, alone with God and nature, delving into the mountain, prospecting the gulches and ravines, in hope of finding the miner's greatest hope, a bonanza of gold on the surface, as was found in early days in California, in place of which he finds silver, or lead, or copper. If these show well he tries them, hoping that he

may develop something that will attract the monied men of the cities, and then make another stake for himself and visit his old chums at home.

Mining, like all other business, must be conducted with economy, and wants a practical miner at its head. Nearly all the failures of eastern investments have been caused by sending out some friend or relation of some of the company to take charge of the mines, who has not the slightest idea of how silver and gold mines are found, let alone how they should be worked. What can such persons be expected to know of mining or to get the precious metal away from the base?

Theory is good and practice is better, but theory and practice are far above either alone. Let your metallurgical students go into the mines and there learn to swing the pick, to drill, to blast, and to distinguish ore from barren rock; let them go into the field and become familiar with the practical part of mining life, and then less money will be thrown away and squandered, and many a valuable property, in place of being condemned, will be made to yield many returns for the money invested.—*Arizona Sentinel.*

Idaho's Best Mines.

A correspondent of the *Idaho World*, says: There has been a difference of opinion among the mining men, even of this county, as to whether the mines of Boise county or the famous silver mines of Atlanta produced the most bullion this year. Although an immense amount of bullion has been shipped by the Monarch and Buffalo companies, we contend that the gold product of the quartz mines of the Basin is greater. Our mines contain free gold, and the cost of milling the ore is small, about \$4 per ton. The cost of extracting the ore from the mines is but small, as very little powder is used. Timber is no object, as the country for miles around is a dense forest. Taking everything into consideration, the advantages we have are far superior to those of any other mining district on the coast, or the Black Hills. I can safely say that we can show a greater proportion of dividend paying mines than any other section. The number of ledges worked in the county last summer, as near as I can ascertain, was 16. Those claims working but a few men I do not count. Out of that number, 12 paid dividends. It is generally considered throughout Colorado, Utah, Nevada and California that the percentage of paying mines is as one to five. It is a singular fact, nevertheless true, that every one of our mines are worked by home capital. This is the cause of them being developed so slowly, and with but little profit on the start. Take, for example, the Ebenezer and Belsbazzr mines, on Fall and Canyon creeks, where they were compelled to pay \$8 per ton for packing and \$8 for crushing in a custom mill. Here is at least \$11 dollars per ton lost to the owners by not having mills at their mines. Consequently proprietors of ledges must work a long time to secure sufficient means to erect mills. It is only within the last few years that any attention has been given to quartz in this vicinity, and already we have four mills in operation—one 25, one 20, and two 10-stamp mills run by steam, with a 10-stamp water mill. Besides these, there are two on Summit flat, one of which will start up as soon as spring opens, and probably both. The mines of the most notoriety are the Gold Hill, Sub Kosa, Belsbazzr and the Banner mines. Any of these in Nevada or Utah would be worth \$500,000; but because they are so unfortunate as to be situated in Idaho, they can scarcely be given away. For instance, the Belsbazzr was bonded to James Monroe & Co. some time ago at a very low figure, with the intention of getting an Eastern company to invest. Mr. Monroe was given the bond because he is acquainted with moneyed men who expressed their desire to invest in mining. He thought he had but a small task before him, but he has concluded that if he succeeds in giving this mine away he will not soon make another attempt to bring capital from the East. And so it will be till some venturesome, enterprising company makes a start, for capitalists are like sheep and follow the leader. The first companies that invest in new districts generally get good mines and raise the excitement. The cost of machinery is not as much laid down here as in the Black Hills, nor are goods so high, yet capitalists prefer to go there because that district is nearer the Eastern markets.

Charcoal Statistics.

We obtained yesterday, from a gentleman who has devoted considerable study to the compilation, and who has procured the figures for the use and information of a Government Department, some interesting statistics in regard to one of our leading industries. The business of coal-burning is second in importance to that of mining, although wholly depending on the latter for its prosperity. As the ores of the district will never be profitably utilized, nor worked by any other process than at present obtains, unless some inventive genius makes a wonderful discovery, any figures relative to the area and extent of the future supply must necessarily be instructive. It is likely that the demand will increase, and in the light of recent developments in our mines, double the amount used at present will be needed for the coming season. There are only seven smelting furnaces in operation at the present time, or less than half the capacity of the district, there being 15 all told. It is probable that nearly all of these

will be at work by the first of June. The present daily consumption is about 8,000 bushels, which in the last five months, reckoning from the starting up of the Richmond and Eureka works, and allowing that, with the K K Con., seven furnaces have been in constant operation, will show a consumption of 1,250,000 bushels. We make the calculation because we believe that the statisticians' figures on the item of consumption for the last five years is below the mark.

The following is the result of his work: There are 800 coal burners employed in the trade, 90% of whom are foreigners and about 50% of the latter are American citizens. With a few exceptions this force is in the employ of less than a dozen firms, two-thirds of whom are of foreign birth. The average distance that the coal is hauled by teams is 35 miles, ten companies owning the outfits. There has been consumed within the last five years 6,000,000 bushels of charcoal, and it is estimated that there is timber enough standing within a radius of 60 miles, to produce 25,000,000 bushels. The regulation standard allows 33 bushels of coal to one cord of nut-pine wood, but this is not correct, actual experience proving that it will not produce more than 28. It will be seen that there is not quite 1,000,000 cords of wood in the growth of timber on the hills and mountains, and probably one-third of this is not available. At the present rate of consumption, our supply will be exhausted in eight years, allowing that every stick of growing timber can be utilized. At the price ruling in Eureka, (25 cents per bushel) the article remaining to be marketed in the future has a value of \$6,000,000.

If the mines of Eureka district remain permanent, and do not give a larger output of ore than at present, we shall be forced to look to the dense timber growths of the Sierra Nevada for our future supply.—*Eureka Sentinel.*

Benton, Mono County.

A correspondent of the *Inyo Independent*, writing from Benton, Mono county, says: Benton has been some place since 1863, that being about the time the mines were discovered here, which have proved to be true fissure veins, bearing rich ore. From 1863 to 1872 the miners shipped their ore by Creaser's teams to Reno for reduction, not being able to build mills of their own. About 1872 a mill was built by a company styled W. J. Williams & Co., which proved to be a curse to the camp, as the company were a set of bilks, and came here for the purpose of bilking the honest miners out of their valuable ore, which before they had been sending to Reno. But after bringing their curse upon the camp (viz., their failure to work the ore), they left the place the worse for their enterprise. The second unsuccessful attempt at fraud upon the people was inaugurated by Bill Leet, who started in on the Williams & Co. plan. He found it would not work, and then sold out to Albert Mack, for exorbitant figures. But Mr. Mack and C. H. Aaron, his superintendent, proved fully equal to working this ore, and made a complete success of it, which proved a year of jubilee to the miners. Up to this time all that could be called Benton was taken out of the mines, shipped to Reno in the shape of ore and returned in merchandise and mining supplies. Since then the boys have a bit or two "to throw over the bar," as they say. During all this time the town has maintained a gradual, healthy growth, and the "bottom" has never dropped out of the place, and, as a friend (who is a mining engineer, and whose business called him away), remarked, "Benton will be a flourishing mining town long after you and I are gone."

We doubt very much if a long etring of how the Comanche, Diana, Kerrick, Eureka, Laura, Centennial, Lyford, and dozens of other mines were progressing, and how their respective superintendents were sinking, raising, drifting, crosscutting, leveling, stopping, tunneling, timbering, and teasing the very bowels out of mother earth, would interest your readers, or I would give them a "game" on that topic to prove that there is really a place called Benton, and that mining is the principal business. But we do not wish to mislead the weary traveler, who might accidentally be going to Bodie, and get him to stop here. Neither do we wish to advance the idea to capital that Benton is the place to invest money, but we propose to move on at our gradual, healthy pace, and we believe our future will be good and well developed mines, a healthy state of commerce, and capital invested here be, as in times past, paying dividends.

Lake District

Bids fair to be a mining camp of considerable note, and we hope are long to give a report of that place that will warrant prospectors in pointing that way, and open up mines worthy the attention of capital. At present, however, with the thermometer at 38° below zero, I could not recommend Lake district as a very congenial field of labor.

ASBESTOS.—Mr. S. V. Carter has found a deposit of asbestos at the mouth of Stony creek, near Jackson valley, in Amador county. The *Ledger* says that the ledge so far as opened is three feet wide. The specimens left with us are merely croppings, and are therefore hard. A few feet from the surface, however, there is no doubt that it will be found soft and fibrous, and almost pulpy. Deposits of asbestos are met with in many places in Amador county, but not one of them is being worked.

More Safety Demanded.

It is the height of folly for any of the mining companies or managements of the Comstock to ignore their responsibility, as well as possible cost, in making their surface engineers work too many hours on a shift. A very significant as well as terrible warning was conveyed in that respect on Saturday last at the Savage mine, whereby a momentary inadvertency of a tired engineer on a 12-hour shift, a cage with four men on it was run up to the sheave, and one man precipitated 1,300 feet down the shaft to his death. By this blood-curdling accident a widow with a large family of children is left to mourn the loss of a kind husband and father and their main support. Such economy on the part of a responsible mining company in trying to save a few dollars by making their engineers work longer shifts, thereby employing less of them, is not only a bad financial proposition but positively criminal. In some little outside mine, where the work of development goes slowly forward, and an engineer has only occasionally to step in and attend to his work, this might be excusable; but never in the case of first-class, actively working mines where the lives of men are every moment at risk, and under the constant responsibility of the engineer. Even the most careful is liable to become wearied by long-continued vigilance and overstrain of his ability, and a momentary relaxation or benumbing of his overwrought sensibilities may, during that moment, as in the case in question, result in death and distress, to say nothing of the pecuniary loss and damage. Overtasked human nature will not always do to rely upon.

We are pleased to see that the fraternity of Stationary Engineers have taken this matter seriously in hand and will hold a meeting in Gold Hill this evening at Miners' Union hall. They invite the engineers of Virginia City to unite with them, and the result should be that no more 12-hour shifts will be ruleable for engineers in any of the mining works of this section. More safety is demanded in this matter. The arrival of a cage loaded with ore or men at the surface is a critical point in the duty and observation of an engineer. The distance is, about that time, very short between safety and destruction, and it requires the utmost care and vigilant, wide-awake watchfulness on the part of the engineer on duty to guard against possible accident.—*Virginia Enterprise.*

Plenty More Left.

The rich silver croppings of various districts of Arizona have been traveled over for years by prospectors and "rule-o-thumb" miners and experts, without any recognition of their value. It is only within a couple of years that silver has been known in the Silver King and Peck mines, although the Stoneman Grade passes right across the former, within a few yards of ore worth hundreds of dollars per ton, cropping out to a height of 20 to 30 feet, and is a road that has been traveled for years. The trail across the Peck mine is one of the oldest in that section. Float ore, worth thousands per ton, was found by Ed. Peck in a spring near the mine, at which hundreds of prospectors have camped. Thousands of men have ridden across the Peck without dreaming of the wealth spurned by their horse's hoofs. The Silver Prince is a ledge parallel to and near the Peck. The trail crosses it also and had worn quite a channel through the soft ore. Little more than a year ago, Houghtelien gouged out for us, right in the trail, a specimen which we had assayed in San Francisco, and which gave a result of nearly \$8,000 per ton. Even at that time, 18 months ago, the Black Warrior was looked upon merely as a pretty good prospect. The Tip-top is another new discovery of silver made in a section that has heretofore been exhaustively ransacked in search of gold. The famous McCrackin is a bold ledge, visible for miles from the principal trails through that part of Mohave county. Yet its location as a silver mine is comparatively recent. What we want to show is that there is still immense tracts in Arizona that have never known intelligent prospecting for silver. The facts just cited seem to prove it. Nearly the whole of Yuma county comes within that category. Of all the men who have run over it for gold, not one in a thousand knows silver croppings when he sees them. Of late, the best traveled trails and the oldest known sections of Arizona have been more prolific in rich silver discoveries. We firmly believe that rule to still hold good and predict many a bonanza to be shortly exposed in this old county of Yuma.—*Arizona Sentinel.*

TIN MINE DISCOVERY.—One of the most important discoveries ever made in this county has been brought to light by Mr. C. P. Converse within a day or two. For several years he has been digging into what he believed an iron vein of immense size, under the belief that iron associated with granite always contained gold. A specimen of the ore was brought to our office last summer, and another specimen forwarded to New York, and thence to Swansea, in England. This week he receives the report that the latter specimen gave 60% tin. Tin is one of the most valuable of metals, and its principal ores have been worked at a greater percentage of profit than any other metal. The mine is located in the extreme northeast of this county, and in just the formation in which this variety of ore always occurs.—*Visalia Iron Age.*

The "Tuscarora's" Surveying Cruise.

The United States steamer *Tuscarora* has been assigned to special duty connected with the survey of the Pacific coast, probably extending down as far as Panama bay. For several years, says the *Alta*, the Hydrographic Office has appealed to Congress for an appropriation large enough to enable it to construct at least two vessels of suitable size and rig, with which to make this survey. From Panama northward we have but imperfect charts, and have to rely upon Captain Belcher's, which, while in the main they serve their purpose, are in many essential and vital particulars grossly in error. The most important of these errors is in the coast line of Guatemala and Salvador, the western coasts being on the existing charts too far to the eastward, and the southern coasts too far to the northward. From actual observations, now pretty well confirmed, the errors range from 12 to 20 miles, and are continuous for several hundred miles. Few, if any, of the reefs, rocks, or outlying dangers are correctly located, and but little of the currents or the true set of the tides are known, and consequently with our increasing use of this coast, it is time that a correct and careful survey of this part of the globe should be made. The commanders of the Pacific Mail Steamship Company have made many surveys which have been of great value to the company, but the only result of any of their labors which has ever been put in print was a small but valuable little work entitled "Remarks on the Navigation of the Coast between San Francisco and Panama," by W. H. Parker, Captain P. M. S. S. Co., which was issued in 1871, and an appendix dated 1873. This work was published only for the use of the company's officers, and could not be obtained by navigators generally. Hence it was to a great extent a "sealed book." Murray's sailing directions for the coast were written in conformity with Belcher's chart, and although corrected from time to time, retained many of the original errors. A correct chart will be very valuable to the maritime world, and especially to our steam and coasting traders, many of whom have been deterred from chartering for this coast because of its unsurveyed and consequently dangerous character. If the Central American governments will now supplement the work about to be done by the United States Hydrographic Office by the erection of light houses, say at Champerico, San Jose de Guatemala, Acajutla, La Libertad, La Union, Amapa, etc., they will aid navigation very materially, and it will be a most profitable investment. Punta Arenas and Realejo are the only ports on the Central American coast which can boast of fixed light-house service. Acapulco has a light which is only lit when a Pacific Mail steamer is expected, and this light is owned and lighted at the company's expense.

Resting Springs.

Parties who have lately arrived from Resting Springs do not give very flattering accounts of that mining section. The reason for the dullness of all kinds of business in that camp is fully shown by a letter received from a reliable party there. He says that they receive mail matter about every 10 days. The stages that were running from Mohave to Resting Springs were discontinued about the middle of November. Three stages are running from San Bernardino, each one requiring about three weeks time to make the round trip. There is nothing very flattering in the prospects of the camp at present, everything going very slowly. The small furnace that was started some time ago was shut down about the middle of November, and the men discharged. The furnace was found too small to be of any practical use for the class of ores they have there, which are difficult to smelt. Everything seems to depend upon the operations of one company, and that one not overburdened with capital. Mr. Osborne, the Superintendent, has gone to San Francisco to purchase a larger furnace, and the writer of the letter understands that the furnace is now en route to that camp. When Osborne gets back it is supposed operations will be recommenced. The writer of the letter is an old miner and gives it as his opinion that the company would do a great deal better with a mill instead of a furnace, as the ores of that district come nearer to being milling than smelting ores, and those from the surrounding mines are nearly all smelting. He thinks the mines there would furnish ore enough to keep a mill running all the time. He is afraid "that the camp will continue to be dull unless some other company takes hold of the mines and does something." All are anxiously waiting for capital to come in and make times better. He says there is at present no money at all, and scarcely any business being done, although everybody is anticipating better times soon and are building great castles in the air. For all this, improvements in the way of building are going on. The writer says they have good mines and men are kept at work in them all the time taking out ore. Several hundred tons of ore are at the furnace dumps, also a large supply of coal, and several men are employed in the mountains burning coal. He says: "No one here knows what is going to be done, all anxiously awaiting the return of Osborne." Let us hope that the coming season will bring good times to Resting Springs as well as many other outside districts, and we believe it will.—*Coso Mining News.*

USEFUL INFORMATION.

Valuable Woods for Carving.

The *Crockery and Glass Journal* appears to have examined this subject with care, and the results will be of interest in this State, where much of the timber mentioned is in vigorous growth. We read in Calvert's *Mechanic's Almanac* that lime wood was almost exclusively used by Grinling Gibbons, for all his magnificent drops and festoons of fruit, flowers and birds, at Petworth, Chatsworth, Burghley, Belton, Melbury, Gattton, and the numerous other noble seats to which his genius has imparted such a charm. Lime tree is soft and pliable to the tool, and less liable to split and splinter than almost any other wood, which qualities render it of great utility to carvers for carrying out designs when lightness and boldness are equally required. It takes a stain well, and a fair polish, or it may be varnished without greatly altering the color of the wood, but giving it a very agreeable box-wood appearance. As well as for large festoons, it is suitable for smaller works, such as book-stands, miniature and portrait frames, etc.

American walnut is a very good wood, and is much in favor for its dark color. It has, however, a more open grain than lime, and therefore requires more care to avoid accidents. It is used for many small works where much projection is unnecessary, as boot-racks, watch-stands, etc. Sycamore, holly and chestnut are amongst the lightest of our woods. The first is greatly, and in fact, principally used for bread-plates, potato-bowls, and other articles where a light tint is a consideration.

Among the hardwoods, oak may be recommended, as also Italian and English walnut. The former from its hard and enduring nature, should as a rule be chosen for executing finials or pew heads, alms-boxes, church and Gothic work in general. It is also much used for clock and hall brackets, and for other pieces of solid furniture. Italian wood is a rich and beautiful wood for a variety of purposes, such as cabinets, book-cases, frames, etc. It is hard, but the effect produced by its use amply repays the extra labor caused by the close texture of the material.

When any very delicate designs have to be executed, and the most minute finish is required, box-wood, ebony, or any other equally hard and close-grained woods are decidedly the best to choose.

Pear tree is a pleasant wood for working, and a good piece resembles lime in its pliability. It is extensively used in France for the purpose for which we employ lime.

The wood must be thoroughly seasoned. The proper time to fell oaks, and most other trees, is when they fail to increase in size more than two feet per annum. If cut down before that period of their existence, the heart will not be fully developed, and will not be as hard as the other part. When oaks are about thirty years old, their growth is most rapid. If wood be in an unseasoned state, it is sure to warp and twist and split. It is therefore very necessary that the natural juices of the tree be got rid of by seasoning it before use. After a tree is lopped, barked, and roughly squared, it is left some time exposed to the weather, and may be soaked in fresh running water with advantage, and hoiled or steamed. Any of these processes tend to dilute and wash out the juices, and the water readily evaporates from the wood at a subsequent period, and the color of the wood will be much improved by this means. Thin planks, if properly exposed to the air, will be seasoned in about a year, but the thicker the wood the longer the time it will take. Oak loses nearly two-fifths of its weight in proper seasoning.

DOMESTICATION OF THE BISON.—Mr. J. W. Cunningham, of Howard county, Nebraska, has a letter on the domestication of the American bison in Mr. J. A. Allen's book devoted to this animal. It appears that the bison has been crossed with the ordinary milch cow, and that half and quarter-breeds are not uncommon, and the cows yield extremely rich milk. They prove to be both hardy and tame. The color of the bison and the majority of the distinguishing characters disappear after repeated crossings. The lump of flesh covering the dorsal vertebrae also becomes diminished. The preservation of a pure breed of the bison does not seem so easy. In some instances where buffaloes have been broken to the yoke they have proved strong and serviceable; but rather unmanageable at times. Unless the breed is maintained in some way artificially, the wild species will, no doubt, before very long become extinct.

A SUCCESSFUL SUGARIE.—Notwithstanding all the accounts we hear of the miserable condition of the beet sugar industries, says the *London Farmer*, it seems that, in some instances at least, the trade is by no means a bad one. The balance sheet of the "Cujawien" sugar factory, at Amsee, now in the second year of its existence, sets forth that during the past season the company have treated 525,630 cwt. of beets, and that, after writing off 5% for depreciation of buildings, and 10% for that of machinery, laying out 96,000 marks on extensions, carrying over 40,000 marks to the reserve fund, and handsomely remunerating the directors, there still remains a net profit of 120,000 marks for division among the shareholders, at the rate of 20% upon their capital stock subscribed.

Care of Boilers and Firing.

All steam boilers should be carefully cleaned at stated times. The time a boiler will run safely without cleaning, depends on the character of the water and must be determined by the circumstances of each case. Some boilers should be cleaned every week, others may run two to four weeks. As a rule every boiler should be opened once a month, the inside carefully inspected and all deposits removed. The accumulation of deposit endangers the safety of the boilers, by preventing contact of the iron with the water; the iron becomes heated to redness, loses its strength and gives way under the pressure of steam. When we consider that a boiler of 40 inches diameter, with 80 pounds of steam, receives a strain of 10,000 pounds on each inch in the length of the boiler, we can more fully realize the importance of taking great care of all its parts. And as the pressure is often increased to 100, 125 and 150 pounds per square inch, the wonder is not that we have so many, but so few explosions. With a mass of deposit between the water and the iron, the quality of the iron is of but small moment, as, if it is heated to redness, and perhaps nearly melted, its tensile strength is destroyed, and a rupture or explosion is sure to follow.

The next important duty of the engineer is to keep a steady water-line in the boiler. All parts of the boiler exposed to the action of the fire must be covered by water. Should the water line fall so low as to expose the top of the flues or crown sheet, the over-heating of the iron is the immediate result and disaster is sure to follow. Again, with a variable water line, the pressure of steam cannot be kept uniform, the machinery is run with variable speeds, and a large amount of fuel is used. The use of a glass water gauge in connection with the water gauge is a great help to the engineer to keep a proper water line. The lower end of the glass tube should be so set that it will lose the water before the flues are exposed, and when water cannot be seen it indicates danger.

GUNS.—John Rigby, the Irish gunmaker, whose weapons were used by the foreign teams in the international contests, is not convinced that American breech-loading rifles are superior to his muzzle-loading ones. He has accordingly challenged the American makers to a contest at 1,000 yards. The challenge is accepted, and the match is to be shot in the spring. So we see it ended.

TO CLEAN TIN VESSELS.—First rub your tins with a damp cloth, then take dry flour and rub it on with your hands, and afterward take an old newspaper and rub the flour off, and the tins will shine as well as if half an hour had been spent in rubbing them with brick-dust or powder which soils the bands.

GOOD HEALTH.

About House Drainage.

The *Herald of Health* has the following in a general article on the health of country residents, from which we draw the following pertinent points: Question—If soap suds and household slops are so dangerous, why do they not always produce some form of contagious disease? Answer—The germs of disease are not always present, or if they are, they may be destroyed by the ozone and oxygen of the air, or favorable winds may drive them off, or the system may not always be in a condition to receive them. If a thistle blooms and seeds on a grass plot, the seeds are wafted off, and only a few ever find a place to grow. Change the circumstances and let it seed on a plowed field, and a majority of the seeds will find a place to grow. The germs of disease are infinitely more easily destroyed than those of the common thistle, and for this reason do not take effect except where all the conditions act favorably.

Question—In what way is the sink dangerous to health? Answer—It may be dangerous, and we should certainly see that it is kept clean. The refuse matter is generally run off into a barrel through a straight pipe. Here lies the danger; this refuse matter sometimes generates a poisonous gas, and as the heat of the room warms the pipe then the gases flow into the room. The consequence is, the pipe may become a source of disease and death. If you have diphtheria in your houses, look to your drains before you give up searching for its cause.

A GOOD RESOLUTION.—A physician who has passed his three-score years and ten writes, as follows: Well do I remember the day and the hour when I made, to me, the great discovery that I could conquer the "blues." I had suffered for a month the most intense mental pain because my business did not go to suit me. I found fault with my wife and children, and nothing suited me. Things were getting most uncomfortable for all of us. I got up one morning as usual and expected to have a bad day, when all at once the impulse seized me as if it had come from the other world, and, straightening myself up to my full height, I said to myself emphatically, "By the Eternal, these miserable feelings have got to go; not once to-day will I tolerate one of them in my mind for an instant." I kept my word, and have done so till now, and find it easy enough to keep the "blues" at bay.

FOOD AND RESPIRATION.—The *Journal of Chemistry*, learns from foreign exchanges that Dr. Speck has lately been engaged in examining the changes produced in the respiratory process by the use of fatty food, of coffee, quinine, alcohol, and water, and by the inspiration of air respectively rich in carbonic acid, poor in oxygen, and rich in oxygen. His chief conclusions are: 1. With an increased proportion of hydrogen in diet the amount of the air inspired and expired decreases. Nutrients, such as sugar, which contain little hydrogen in comparison with their oxygen, involve more exertion of the respiratory organs than such as are rich in hydrogen, like the fats. 2. The more carbon predominates in the food in proportion to hydrogen, the more air is exhaled in proportion to that inhaled. 3. The more carbon increases in the diet in proportion to hydrogen, the more carbonic acid is evolved, and the more oxygen is taken up; the richer the diet in hydrogen, the less oxygen is required. An atmosphere containing five or six per cent. of carbonic acid could be breathed for some minutes without oppression. At 11.51% great exertion was needed to breathe for one minute. At 7.2% all the carbonic acid produced in the body is retained in the blood, and 11.2% a great part of that also which is inhaled.

TAKE CARE OF YOURSELF.—Hall's *Journal of Health* gives the following good advice: A New York drayman or hack driver, considers his horse a part and parcel of himself, and the moment his animal ceases motion in cold weather, that moment he covers him with a blanket. Why this care? He knows that if neglected, the horse will take cold, and that in a day or two, he will most probably die of some form of inflammation about the lungs; yet multitudes of people perish every year, from being cooled off too quick after exercising. More people die prematurely from want of care in any given year, than perish by plague, famine, pestilence and war. The Duke of Wellington died of an over-hearty meal of venison in November. Gen. Taylor was taken from the White House to the grave, by a bowl of fruits and iced milk, on a Fourth of July. It is a good omen, that intelligent, reflecting and humane teachers in different parts of the country, are beginning to make personal health one of the branches of an elementary education. Is it not wonderful that more efficient steps have not been taken in that direction long ago.

TEA AND HOT BISCUIT.—A professor of hygiene in a young ladies' seminary writes as follows: Popular opinion associates the teapot with the middle-aged and the elderly ladies, but popular opinion would find itself mistaken, if not shocked, to see the middle-aged lady teachers refreshing and rebuilding their brains, at the day's close, with that perfection of all foods and brain-builders, a glass of milk, while they of 16 sip their cups of tea. And then the fancy for hot biscuits is something truly marvelous. There was a time when nothing else could be had for breakfast. That, of course, was a glad time for the mistaken souls that dream of finding bliss in such a way, and was a no less glad time for the pill-vendors. Now, by one of those revolutions which come to families now and then, the hot biscuit breakfast has come to be a thing of the past, and substitute the "ounce of prevention" of dyspepsia—in the form of bread which has reached its perfection by means of the chemical change secured by an interval of 24 hours between the baking and the eating.

TIPLING NURSES.—There can be no doubt that nurses' bottles may be worse for children than nursing-bottles. M. Anarion, in the *Archives de Toxicologie*, reports two cases in which children, at the breast of apparently healthy and well-to-do nurses, were suffering from convulsions, and in which the children were saved by depriving the nurses of alcoholic potations, in which they were found to be freely indulging. As the *Philadelphia Reporter* remarks, it is a pernicious delusion of nursing mothers and wet-nurses, that, when suckling infants, they required to be "kept up" by alcoholic liquors; and women who are little given to alcohol at other times become, for the nonce, determined tipplers,—this being, perhaps, of all other times that when alcohol is likely to do most harm and least good.

EGG OIL FOR WOUNDS.—Extraordinary stories, says the *Druggists' Circular*, are told of the healing properties of a new oil, which is easily made from the yolk of hens' eggs. The eggs are first boiled hard, and the yolks are then removed, crushed and placed over a fire, where they are carefully stirred until the substance is just on the point of catching fire, when the oil separates and may be poured off. One yolk will yield nearly two teaspoonfuls of oil. It is in general use among the colonists of south Russia as a means of curing cuts and bruises, etc.

TOO WHITE FLOUR.—Messrs. Mouriez & Chievre, chemists, who have superintended the provision of bread for the hospitals, and subjected all kinds to experiments, submitted a report to the French Academy, in which they condemn the practice of making bread too white. It is then, they remark, a condiment, not an aliment. The exclusion of bran is a loss of nourishment to the consumer; the palate and fancy are gratified at the expense of the whole animal economy.

OUR IGNORANCE.—S. D. Goss, M. D., says: "Of the essence of disease nothing is known."

The Week.

We have been blessed with another week of rainy weather and already the rainfall for the year foots up about 10 inches more than we had at the same time last year, thus insuring good crops and a prosperous season. Considerable damage has been done to ditches in different parts of the country by the late storm, but these are repaired as rapidly as may be and most of them are now running full. As a consequence, the hydraulic miners have plenty of water and are being repaid for their long term of enforced idleness. The people throughout the State now look forward to prosperous times once more, and although the effects will not be felt for some time to come, there are already encouraging symptoms of revival in different branches of trade. The lower part of this State in particular suffered severely during the drouth of 1877, but the abundant rainfall received so far, insures to the population there prosperous times again. The mining community throughout the State are rejoicing over the heavy rains, which are sufficient for present purposes, while in the more remote regions a good supply of snow is hanked up, which will be available when the rains cease. Last season, the storms of October and November deposited little snow on the mountains, but rather washed away what had collected. The snow fall in the mountains, which regulates our supply of water in summer, is much heavier this year than last and the snow is packed and hardened. Therefore, without a doubt, a good water season is already assured, even if no more should fall, but the probabilities are that the supply will be very materially added to before spring opens,

Pacific Coast Storms.

At a late meeting of the National Academy of Sciences, held at Columbia college, New York, Prof. Elias Loomis read a paper on the origin of storms, based upon data obtained from the United States signal service. In this paper he stated that our great storms began in the neighborhood of the Rocky mountains, and that no example is found of any considerable storm arising on the Pacific coast south of Oregon. This may be all very true, as far as the storms which visit the Eastern States are concerned, but probably Prof. Loomis would have seen fit to change his opinion in some respects, had he been in this part of the country for the past two weeks. Then again, there is some difference in the quality of storms, whether of wind or rain, or both, with a chorus of thunder and flashes of lightning to make it interesting.

The late storm which visited this State assuredly came from south of Oregon, as all our storms do. Probably the great barrier interposed by the Sierras prevents the effect of these southerly coast storms being felt to any great degree on the other side of the mountains, and such storms as are felt there from this side may come from north of the California boundary. However, as far as this State is concerned, all of our heavy storms come from the south. We occasionally have a heavy norther once in a year or so, which is unaccompanied by rain. What are called our storm winds, invariably come from the southeast or southwest, and it is these winds which are destructive to the coasting fleet. These southerly winds have prevailed to an unusual extent during the past month accompanied by heavy rains and furious squalls. The cause is explained in the able paper on the climate of California, by Mr. Redding, published in last week's PRESS.

That we do not have here the heavy storms which occur on the Atlantic side, we know very well and congratulate ourselves that this is the case. We never have any hurricanes on this coast that occasion loss of life and property on shore, nor do long continued and severe gales of wind inflict great damage to the shipping interests as on the Atlantic coast. Our southerly gales, however, are heavy on the coast and get up a very severe sea. Already this season there have been 14 wrecks, most of them within the past two weeks, and no doubt others will soon be reported. It is but proper to state, however, that most of these have occurred rather than want of good harbors on the coast-line than from severity of the gales. Few vessels are lost on this coast from stress of weather, but most of them from getting ashore in fogs, parting their moorings in roadsteads, etc.

Still the wind does blow strongly when from the southeast, or more particularly, the southwest. The latter wind is most destructive. During the last storm several pilots were carried away in vessels bound to foreign ports, because it was impossible to put them back on their pilot boats in the sea running outside the bar. One pilot boat had to lie outside the bar seven days waiting to get in. Part of the time she was laid to under bare poles, something very unusual to do, and almost impossible with any fore and aft vessel except a good pilot boat. As an illustration of how the wind blew at that time, the captain of the pilot boat referred to informed the writer that the China steamer found it impossible to make any canvas stand. She was running up the coast with the wind over the quarter, 13 knots an hour. When they set the main topsail, made of No. 1 canvas and new, it blew right out of the bolt ropes. This was on a steamer going at great speed almost before the wind, and the sail was close-reefed, and set only to steady the vessel.

For over two weeks we have had a succession of gales from the south-southeast, or southwest, all accompanied by rain. The further north we go on the coast the stronger are these southerly gales, as is also the case with the westerly summer breezes. Unfortunately the coast of California north of this point, as well as the coast of Oregon, has no harbors that are available in these gales. If vessels are inside they cannot go out, and if they are out they cannot get in. Moreover, there are not half a dozen that afford any protection whatever in gales from the southward.

The record of marine disasters on this coast is by no means so appalling as that on the Atlantic. There they have more traffic and heavier gales; but still the statement that no considerable storms arise on the Pacific coast south of Oregon, is totally erroneous. As far as this concerns the East, it is no doubt correct; but here it is different, for, as has been shown, all our heavy storms come from the south.

BULLION SHIPMENTS.—Since our last issue shipments of bullion from the prominent mines have been as follows: Northern Belle, Jan. 21st, \$3,237.72; Arizona, Jan. 21st, \$1,488.98; Alps, Jan. 24th, \$2,900.00; Christy, Jan. 23d, \$1,726.00; Christy, Jan. 25th, \$1,700.00; Tybo Con., Jan. 21st, \$8,701.31; Grand Prize, Jan. 26th, \$25,300.00; Manhattan, Jan. 22d, \$7,634.73; Christy (Utah), Jan. 28th, \$1,586.00; Tybo Con., Jan. 23d, \$8,797.10; Manhattan, Jan. 26th, \$7,273.39; Endowment, Jan. 28th, \$1,873.45; California, Jan. 26th, \$229,186.75; Con. Virginia, Jan. 26th, \$195,272.59; Alps, Jan. 30th, \$5,000; Christy, Jan. 30th, \$2,670; Tybo, Jan. 25th, \$4,324.23.

An Important Decision.

The Mining Debris Case to be Left to the State Courts.

The United States Supreme Court on Monday decided the case of the Little York Gold Mining and Water Company vs. Keyes, in error to the Circuit Court of the District of California. The question in the case is whether grants made by the United States on placer mines as such involve the right to discharge refuse earth and gravel, produced by working the mines, called tailings, into neighboring streams—in the case of Bear river—inasmuch as the mines cannot be worked except by means of such discharge of streams of water loaded with refuse; and the immediate question was upon its removal from the State to the Federal Court. It is here held that the motion to remove is not within the statute, because it does not appear upon the record as made that the suit really involves a controversy as to the construction or effect of the Federal law affirmed. The Chief Justice delivered the opinion, Mr. Justice Bradley dissenting, who holds that the case in question sufficiently indicates its Federal character.

This view of the matter throws the subject back to the State courts to decide upon, as it is held that the question is not one of a Federal character. There is little doubt, however, but that the matter will eventually come before Congress.

In the California Legislature, Senator Haymond's joint resolution, relative to public lands in this State, passed the Senate with little discussion and was favorably reported back to the Assembly by the Committee on Public Lands, to whom it was referred. This resolution bears on the question of irrigation and mining debris both. The words "and protection of agricultural lands from the effect of mining debris" were inserted by the Senate Committee.

The resolution, as it passed the Senate, is as follows:

WHEREAS, It has been the settled policy of the Government of the United States to donate to the several States the swamp and overflowed lands within their respective limits, in trust, that the proceeds of the sale thereof should be applied to rendering such lands fit for habitation and cultivation; and, whereas, a large portion of the lands in this State, unsold and belonging to the United States, cannot be inhabited and cultivated without irrigation; and, whereas, it would therefore seem to be in accordance with the policy of the Government to appropriate the proceeds of the sales of such lands to the purpose of rendering them suitable for such habitation and cultivation, thereby tending to their settlement, the encouragement of emigration and the promotion of the general welfare; therefore, be it

Resolved by the Senate and Assembly of the State of California, That the Government of the United States be and is hereby requested to donate to the State of California the proceeds of the sales of public lands heretofore made in this State, to be used by the State, under such regulations and on such trusts as may be prescribed, for the purpose of irrigation and protection of agricultural lands from the effect of mining debris; and be it further

Resolved, That the Governor is requested to transmit copies hereof to our Senators and Representatives in Congress.

The Popular Loan.

The four per cent. funded loan of the United States is being subscribed to rapidly. Subscriptions were received for the first time on the 26th ult., and on the 28th subscriptions were received to the amount of \$2,600,000. This is termed the "Popular Loan" and is intended to offer an opportunity to all classes of people to take United States bonds in small amounts, which will give them better security for their money than they get in ordinary investments or ordinary savings banks. The Government pledges its faith to pay the interest and redeem the bonds and although the interest is low, the money is perfectly safe.

The bonds are redeemable July 1st, 1907, and bear interest, payable quarterly, on the first day of January, April, July and October of each year, and are exempt from the payment of taxes or duties to the United States, as well as taxation in any form or under State, municipal or local authority.

The subscriptions may be made for coupon bonds of \$50, \$100, \$500, \$1,000, and for registered bonds of \$50, \$100, \$500, \$1,000 \$5,000 and \$10,000.

Two per cent. of the purchase money must accompany the subscription; the remainder may be paid at the pleasure of the purchaser, either at time of subscription or within 30 days thereafter, with interest on the amount of the subscription, at the rate of 4% per annum to date of payment.

Upon the receipt of full payment, the bonds will be transmitted free of charge to the subscribers, and a commission of one-fourth of one per cent. will be allowed upon the amount of subscriptions, but no commission will be paid upon any subscription less than \$1,000.

Forms of application will be furnished by the Treasurer at Washington, the Assistant Treasurers at Baltimore, Boston, Chicago, Cincinnati, New Orleans, New York, Philadelphia, St. Louis and San Francisco, and by the National Banks and bankers generally. The applications must specify the amount and denominations required, and for registered bonds, the full name and postoffice address of the person to whom the bonds shall be made payable.

The interest on the registered bonds will be paid by check issued by the Treasurer of the United States, to the order of the holder, and mailed to his address. The check is payable on

presentation, properly endorsed, at the offices of the Treasurer and Assistant Treasurers of the United States.

Payments for the bonds may be made in coin to the Treasurer of the United States at Washington, or Assistant Treasurers at Baltimore, Boston, Chicago, Cincinnati, New Orleans, New York, Philadelphia, St. Louis and San Francisco.

To promote the convenience of subscribers, the Department will also receive, in lieu of coin, called bonds of the United States, coupons past due or maturing within 30 days, or gold certificates issued under the act of March 3d, 1863, and national banks will be designated as depositories under the provisions of section 3,153, Revised Statutes of the United States, to receive deposits on account of this loan, under regulations to be hereinafter prescribed.

The issuance of these bonds will give an opportunity for any man with savings to invest to put them where they will be perfectly safe, require no attention and bring interest promptly. High rates of interest, as a general thing, mean comparatively poor security, and low rates good security. Although to us on this coast 4% per annum seems ridiculously small, where we have been accustomed to hear of 1% per month as a regular thing, there is no doubt that this popular loan will meet with ready acceptance among all classes of the community.

The Business Depression.

While we are having hard times in the United States, they are having harder times elsewhere. Of course in the countries engaged in warfare great distress prevails, but in other parts of the world where peace prevails the industrial situation is by no means bright. In England the coal and iron workers, a very large proportion of the laboring population, are by no means well off. In Northumberland the collieries have accepted a reduction of wages, and throughout the district of the northern board of arbitration the iron workers' wages will probably be still further reduced. The textile trades are generally depressed, and at Rochdale some hills are on short time. In the forest of Dean and South Wales great distress still prevails, and measures have had to be taken for its relief. At Sheffield a large number of puddlers and shinglers have received notice of a reduction, and under present circumstances it is likely to be accepted. In the building trades several important strikes still continue, and labor is continually coming and going on the work affected. At Stafford the boot and shoe trade is especially slack, and at Birmingham many of the staple industries are but indifferently employed.

It will be seen from this that in England they are having hard times as well as we are here, and that the depression in trade is by no means confined to one locality, or due to local causes alone. It must be remembered, moreover, that although the greatest distress comes upon the laboring community, the numerous and increasing failures all over the country show that employers have suffered as well. Many establishments which have heretofore been doing a good business and had a good standing have succumbed to the depression of 1877, and probably more will have to go before a business revival is effected. Among us in this State the prospects for more general activity and better times are gratifying indeed. We have been blessed with abundant rains, insuring good crops and a good water season for the mines for this year, and the people are beginning to recognize the fact that they have been living too much on a speculative basis. The experience of the past year will teach many the necessity of exercising more economy in the future, and the result will be beneficial to the community. We have not on this coast entirely gotten rid of our fast modes of living, prevalent in early days, when money was so plentiful, but as the new generation comes to the front with, we hope, better legitimate business ideas, and less speculative tendencies, we shall continue to improve.

Postal Delinquencies.

MESSES. DEWEY & CO.—Gentlemen:—Since my paper (the MINING AND SCIENTIFIC PRESS) has been directed to this office, I have not received more than one number per month. The office is in J. W. McWilliams' store, and all the townsfolks are allowed to walk in the little apartment at pleasure and select that which best pleases them, and those at a distance must content themselves with such parts of their mail as the others do not choose to take. Noticing to-day the appointment of a special agent of the Post-office Department in your city, that placing the remedy within easy reach of you and alone prevents me from writing to the Department at Washington. I am not the only sufferer, but have not time now to write more on the subject, hoping you will feel sufficient interest to attend to the matter yourselves.

Yours respectfully,
G. H. MOORE.

Battle Mountain, Lander Co., Nev., Dec. 23d, 1877.

[We publish the above for the benefit of all whom it may concern. It is the first and only complaint we have heard from that quarter. As it is for the interest of every post-master to do the best he can to give satisfaction, we trust that Mr. Moore will have no further cause to complain. We pay Uncle Sam his own price for postage on papers sent from our office, and he ought to pay his post-masters enough to deliver them properly.—ENS. PRESS.]

THE creeks and gulches all over the country have been booming this week, and in the mining counties any amount of "slickens" have been washed down.

An Eastern Idea of Lead and Silver.

The most ridiculous story which has come over the wires for a long time is contained in the following dispatch from New York on Monday, purporting to be a *Tribune* Washington special:

It is reported on good authority that the sum of \$300,000 has been raised by those interested in silver mining on the Pacific coast to assist in mobbing public opinion in favor of the remonetization of the "dollar of our fathers." This sum, it is said, is being used judiciously in those sections of the country where the sentiment of the people is strongly against silver inflation. In the East, bright and active young lawyers who have some influence in their respective localities, are said to have been hired at from \$1,000 to \$2,000 each, to write or speak in favor of silver, and so turn the tide in its favor. In the meantime the owners of silver mines are said to be carefully running their drifts and adits on half-force and time, to avoid the glut of silver in the market, and thus keep up its price as much as possible, until the fate of the Bland silver bill is decided. The recent discoveries of chemists and metallurgists in the science of cupellation has been so important that some of them claim that they can even melt up sheet lead and piping in ordinary use, and extract a sufficient percentage of silver to make the operation largely profitable, and arrangements have been already made to reopen the workings of many abandoned mines of poor ores under new cupellating processes, if the bill should pass.

If reading that paragraph will not make some of our silver mining friends smile we do not know what will. New cupellating processes for silver ores is good. No doubt there are several new processes, as plenty of them are always floating about the country, but we haven't heard of any since the Fryer that started up any new mines on its account, and we all remember the result of that. But we have not heard of any people with silver mines running their "drifts and adits" on half force and time to avoid a glut of silver, though some may be doing it for fear of not getting any more.

These chemists and metallurgists who have discovered such wonderful new things in the science of cupellation ought to keep their secrets to themselves and set up a junk shop to buy up all the lead pipe and sheet lead in the country, otherwise our refiners might get ahead of them before that pipe went on the market. They pay our refiners a very poor compliment when they think they can get silver enough out of lead pipe to make the operation profitable. Of course you can get silver out of lead pipe, for you do not find much lead not associated with silver, and it does not pay to work it so very close as to get out every atom; but the public may rest assured that when the base metal is refined and the lead and silver separated, as it of course always is, the refiners do not leave any more silver in the lead than they can help. As a general thing the less the Eastern people say or write about mining or metallurgical matters the less chance there is to expose their ignorance, and while such paragraphs as the one above quoted may serve a purpose on the other side of the Rocky mountains, they only provoke a smile out here.

Periodicity of Rainfall and Its Probabilities.

Again Prof. Becker, of the State University, favors our readers with graphic reports of his studies concerning the rainfall of this coast. We make the engravings from drawings furnished by him, and they and the descriptions of their teachings contained in the letter which we print below, are worthy of careful study. As he says in his letter, his deduction made last December was that we should have 20 inches of rain in San Francisco this year, and the verification of this prediction is certainly well-nigh realized. Let this fact lead all to follow the Professor in his researches. He writes:

EDITORS PRESS:—By referring to the records of the rainfall for San Francisco, or to the diagram published on the ninth page of your present volume, you will perceive indications of what seems to be a 13-year periodicity, there being decided minima in the seasons of 1850-51, 1863-64 and 1876-77. It struck me that these indications might be tested by representing the rainfall graphically in such a way that the curve would return upon itself at the end of the period. If, then, the curve for the second period were superimposed upon the first, a similarity in the fundamental laws governing each would at once manifest itself to the eye. The experiment succeeded beyond my expectations, so much so, that when I showed my results to Prof. Davidson, he pronounced them of decided local importance, as well as of general interest, and advised that they should be published on this coast. I have prepared diagrams on a large scale for him, which he exhibited at the Academy of Science.

Further to test the apparent law, I discussed the Sacramento and Stockton rainfall in the same way, and obtained results which prove at least that at these places (taken for want of

data from more distant stations, to represent the Sacramento and San Joaquin valleys) the rainfall is governed by the same laws controlling the precipitation on the coast at San Francisco.

I send you with this note a diagram, in which, for comparison, the observations of the three places are plotted in the ordinary way on rec-

Diagram Showing Comparative Rainfall at San Francisco, Sacramento and Stockton.

tangular co-ordinates, and on the same scale. A second plate exhibits the periodicity and the probabilities as derived from past observations. The latter needs a word of explanation. From the center of each diagram diverge at equal angles 13 radii. Each represents one rainy season of the 13-year period, the distance from the center at which the curve crosses each radius

the rainfall for each year, and the positions of the latter in the period.

It will be observed that these curves are either nearly coincident or cross each other at short intervals: good evidence that they are vibrations from a common mean, or a fundamental law.

In order to advance toward an empirical de-

Diagram of Periodicity and Probability.

termination of this law, I drew a curve through the points representing the mean of the rainfall for each corresponding pair of years—say 1852-3 and 1865-6—and also through the intersections of the curves. The figure thus obtained is shown on the diagram as a full black line. The mean curve thus obtained still showed evidences of a vibratory character, which I

The measurements of the probability curve I give with the tables of figures, as follows:

I may mention that they indicate 20.50 inches for San Francisco for the second year of the period, which is the current season. While I do not care to hazard any prediction, I point to this as a hopeful fact, which now seems more likely to find confirmation in the rain-gauges than it did when I first made it out, late in December.

As a further evidence of the 13-year periodicity, I may point to the total amounts of rain which have fallen during each period. It will be seen that in San Francisco the precipitation in the two periods is so close as to be far within the necessary errors of even Mr. Tennent's observations. In Sacramento and Stockton they come quite close. The variations, moreover, are in opposite directions at the two places, though the difference at Sacramento is much greater than at Stockton. I also give the sum of the probability curve indications, which, it will be seen, come very close to the mean of the observations, a fact which appears to show that it is constructed on rational principles.

If, then, I have not been led astray by accidental coincidence, we shall be blessed with abundant rains for four or five seasons to come. But of course it must not be forgotten that the data discussed are too few, both as time and geographical distribution, for any very reliable generalizations.

Observations before 1849 do not, I believe, exist. Observations at more widely separated points do, but I have not been able to obtain them in a suitable form. The "Smithsonian Contribution" No. 222, contains many data as to the rainfall in California, but unfortunately the precipitation is given in calendar years, instead of by seasons; nor does the memoir afford any means of separating the seasons. I have written to Washington to request data from which to ascertain whether or no the same laws prevail throughout the Pacific States; and shall be much obliged to any of your readers who may have data extending over a considerable number of years, and who may feel sufficient interest in this discussion, to transmit them to me.

G. F. BECKER.
University of California, Berkeley, Jan. 21st.

MINING ACCIDENT.—A severe accident occurred at Truckee Flat on Tuesday last, resulting in the death of two miners named Simon Shay, aged about 48 years, and Thomas Bowen, aged about 30. The men, with ten or a dozen others, were working below a large reservoir, which gave way, precipitating its body of water suddenly upon the workmen. All escaped but the two unfortunates named above, who were carried by the rush of water nearly three quarters of a mile through the Pittsburg and Yuba River Mining Company's flume. When found, Shay was dead and Bowen survived but a few hours. Both leave families.

A PETITION has been filed at the Clerk's desk in the House on behalf of McGarrahan in the New Idria mining case. McGarrahan asks legislation from Congress to correct the record. The case was referred to the Committee on Lands, and is likely to attract a good deal of attention before it is concluded.

The engineers at the Yellow Jacket works have been placed on eight hour shifts.

Mining & Scientific Press Patent Agency.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system and intimate acquaintance with the subjects of inventions in our own community. All worthy inventions patented through our Agency will have the benefit of a description or an illustration and explanation in the MINING AND SCIENTIFIC PRESS or the PACIFIC RURAL PRESS. We transact every branch of Patent business, and obtain Patents in all civilized countries. The large majority of U. S. and Foreign Patents granted to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Advice and Circulars Free. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior.

The Mining & Scientific Press.

Established in San Francisco in 1860, is now the Largest, Most Original, Best Illustrated, and Most Ably and Carefully Edited Practical Mining Journal on the Western Continent. Its contents are made up of fresh intelligence in a condensed and interesting style, easily appropriated by the reader, who finds its columns replete with new facts and ideas not obtainable in the books of the past, nor in any other of the journals of the day.

Varied in its carefully compiled and conveniently arranged departments, representing the special and leading industries of the Pacific States—Mining, Mechanism, Manufacturing, Building, Improvements and Inventions—it becomes a weekly informant to all Scientific, Mechanical, Manufacturing and Industrial Progressionists on the coast, an immense list of whom testify to its pleasant, profitable and elevating influence.

Let every friend of Science and Industry on this side of the continent take pride in sustaining and advancing a faithful representative of their special interests by subscribing for the PRESS, and urging its patronage by others—without delay.

Subscription, \$4 per annum, in advance.

25 Fashionable Cards, no two alike, with name, 10c. postpaid. GEO. L. REED & CO., Nassau, N. Y.

PACIFIC BUSINESS COLLEGE, 320 POST STREET, Opposite Union Square, San Francisco.

This institution imparts a first-class Commercial Education, a practical knowledge of Telegraphy, and thorough instruction in the English and Mathematical branches, Penmanship and the Modern Languages. It has ever been a cardinal principle in the management of the College to provide thorough and practical courses of study. Every available modern improvement has been introduced, and whatever energy and liberal expenditure of money could do, has been done to place the institution at the head of similar schools.

LIFE SCHOLARSHIPS

For a complete Business Course are issued at the low rate of \$70. This is the only Business College in the State that employs this liberal system of tuition fees. Day and evening sessions during the entire year. Ladies are admitted into all the departments. Each student receives separate instruction. The discipline at the school is excellent. Graduates at the Pacific Business College find little difficulty in obtaining good situations, being preferred by our business men to the graduates of any similar institution. Those who desire to prepare themselves for the practical duties of life, at the least expense of time and money, should examine the merits of this school before attending elsewhere. Send for circulars.

Among the advantages gained by this holder are the following:

It can be opened and closed quickly.
The points are less obstructed while the articles to be filed are being placed.
The papers (wholly or partly folded) can be either "straddled" over the lower bar, or filed in regular book order.

The elastic hinge and band accommodate and hold firm either a large or small number of papers.
With less material, it is lighter and less cumbersome than other holders, and approaches nearer to bookbinding.

It has no rigid hooks, hinges or loose parts to break or get lost.

It has proved durable in practice. The file is adjusted but 52 times a year for a weekly paper, and a sample holder can be opened and closed 1,000 times without showing wear.

Five sizes are made to suit the dimensions of different papers, viz.: 15, 22, 26, 30 and 34 inches, inside measure. Single samples will be mailed from office for 50 cents, (and upward, according to size), postpaid. Wholesale and retail agents wanted.

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING AND TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

G MAHE, Director,

Musical Instruments.

The firm of Kohler & Chaso, of 633 and 635 Clay street in this city, is an old established and trustworthy house, dealing in pianos, organs and all other kinds of musical instruments. They are extensive importers of instruments and instruction books, and have long held an enviable position in this branch of trade. We take pleasure in recommending them to all our readers who wish to introduce the refining influences of music to their homes. The firm make a specialty of the Decker Brothers' piano, the Mason & Hamlin cabinet organ, the Emerson piano and the J. & C. Fischer upright piano. All of those instruments have gained a wide fame for excellence and won high praise from those who know best what constitutes excellence in a musical instrument.

We would speak especially at this time of the Decker Brothers' piano. We cannot do better than present a testimonial of its quality, freely given by a group of musicians whose praise will commend itself to all music lovers. During the Centennial there was held in Philadelphia a grand musical congress, at which the Decker Brothers' instruments were used, and the result was the following straightforward endorsement:

PHILADELPHIA, June 27th, 1876.

The Decker Brothers' Grand pianos, used by the Musical Congress at their grand operatic concerts and musical festivals, recently given at the American Academy of Music, were remarkable for their superior quality of tone and extraordinary power. Finer instruments we never heard. Clara Louise Kellogg, Annie Louise Cary, Zella Seguin, Julia B. Rive, Esmeralda Cervantes, Joseph White, Max Marolzek, P. Brignoli, S. B. Mills, P. Ferranti, Fritz Remmert, E. Behrens.

A matter which we would make most prominent in this connection is, that the Decker Brothers' name is the subject of attempts at counterfeiting. This is the penalty which the manufacturers of a first-class instrument have to pay for the gaining of a good name, and all our readers should be on their guard against imposition. Unprincipled parties have manufactured and sold cheap pianos under the names of "Decker," "Decker & Co.," "Decker & Brothers," "Becker Brothers," etc., doing business on the reputation and popularity of the celebrated Decker Brothers' pianos. All genuine Decker Brothers' pianos have their name in front on the pianos above the keys, viz.: Decker Brothers, New York. In all genuine Decker Brothers' square pianos the following words appear, cast upon the iron plate on the inner left-hand side of the instruments: Decker Brothers' patent, June 2d, 1863.

The simplest way to guard against imposition is to deal with those who are well known to be trustworthy. Kohler & Chase have a reputation of this character established by twenty years of business experience in this city.—*Pacific Rural Press*, Nov. 1st, 1877.

The Best and Most Popular Pianos

The Largest and Oldest Music House on the Pacific Coast.

FINE RANCH FOR SALE.

PRICE, \$8,000.

The ranch is situated on the direct stage road between Mendocino City and Cloverdale, in Mendocino County. Forty miles from Cloverdale, 20 miles from Navarro Ridge and one mile from the Christine Postoffice.

It Consists of a Total of 2,000 Acres,

Of which 640 are secured by Government title and the balance by possessory title. It consists of

150 Acres of Rich Bottom Land,

Which is adapted to the raising of Wheat, Barley, Oats, Potatoes, Corn, Vegetables, etc., and will raise as large crops as any land in the county. There is 1,210 acres of Fine Rolling Land which is a No. 1 pasture land, and capable of keeping 1,000 head of Sheep, or 100 Dairy Cows. The whole ranch is well fenced with picket and post and rail fence, and has eight good buildings on it, consisting of a good substantial and comfortable

Dwelling House of Six Rooms,

Two Barns, one of them 100x40 feet, and the other 40x40 feet, a Granary, Woodshed, Chicken House, and a No. 1 Dairy House, new last year. There is a bounteous and never failing supply of good soft water at both the Dwelling and Dairy Houses.

On the ranch is a large quantity of Redwood timber, suitable for all purposes. There is a

Fine Orchard of Some 300 Trees,

Of the choicest varieties of Peach, Apple, Pear and Plum, as well as a large quantity of Grapes, Currant and Gooseberry bushes, and other small fruit. There is 100 acres sown to Wheat and Barley, which is now up four or five inches, and promises an abundant harvest in the fall.

The owner has also about 40 head of Cattle, a few Sheep, five horses, 150 head of hogs, 100 Hens, and a large supply of all necessary Farming Utensils, which he will dispose of to the purchaser at very reasonable terms if desired.

The neighborhood is as good as could be desired, only one mile from a store and one-half mile to a good schoolhouse, as well as one-half mile from a church.

The owner's reasons for selling are his wife's health and his dislike of the business. At the price at which it is offered it is the cheapest ranch in Mendocino County, as the crop bids fair to be worth when harvested, \$4,000.

Terms are \$3,000, one-half cash and the balance secured by a mortgage at one per cent. For full information, address

The Latest and Most Complete Manual.

THIRD EDITION OF

Skidmore's Mining Statutes,

WITH INSTRUCTIONS, DIGEST OF JUDICIAL AND DEPARTMENTAL DECISIONS, RULES OF PRACTICE, FORMS FOR SECURING AND CONVEYING TITLE, SPECIAL STATUTES, AND INDEX.

We have no hesitation in announcing Mr. Skidmore's popular work, as revised and enlarged, the most complete, reliable, and useful Manual of Mineral Law extant. It contains many features not found in other works, such as the Rules of Practice established by the Department of the Interior, the Coal and Saline Acts, the Timber Regulations, and Digest of the most recent and important Judicial Decisions. The ordinary Forms of Incorporation and Conveyancing of Mining Claims in use in California have been added, and a full Index renders the various matters easy of reference.

The Digest gives the dates of the decisions and reference to the periodicals and works in which they may be found, and the introduction of index words and phrases in capitals and bold-faced letters renders it easy to find at once the particular information needed.

Mr. Week's Commentaries is a more elaborate work, a treatise for the lawyer, but even to those of the legal profession who have that work, this will be a convenient and valuable hand-book.

Mr. Skidmore seems determined to retain the enviable reputation established for his work as the most complete and reliable

Manual of Mining Law.

It is beautifully printed upon the best paper; contains 140 clearly and closely printed octavo pages, and is published at the low prices of \$1 in pamphlet and \$1.50 in law sheep binding.

Send Mailed, post-paid on receipt of price.

THE CLIMATE OF CALIFORNIA.

A thoroughly studied and ably written treatise on this subject by Hon. E. B. Redding, appears complete in the *Pacific Rural Press* for January 26th, and also the *MINING AND SCIENTIFIC PRESS*. Based upon facts, figures and careful and extensive observations made in various parts of the State on this important subject, it is a volume of reliable information, interesting to every resident of the State. The information is condensed in a paper read before the California Academy of Sciences, and is published in the *Press* as read before that Society without any alterations or omissions. Extra copies, post-paid, 10 cents. Address DEWEY & CO., Publishers, 202 Sansome Street, San Francisco.

Mining & Scientific Press Patent Agency.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system and intimate acquaintance with the subjects of inventions in our own community. All worthy inventions patented through our Agency will have the benefit of a description or an illustration and explanation in the MINING AND SCIENTIFIC PRESS or the PACIFIC RURAL PRESS. We transact every branch of Patent business, and obtain Patents in all civilized countries. The large majority of U. S. and Foreign Patents granted to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Advice and Circulars Free. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior.

The Mining & Scientific Press.

Established in San Francisco in 1860, is now the Largest, Most Original, Best Illustrated, and Most Ably and Carefully Edited Practical Mining Journal on the Western Continent. Its contents are made up of fresh intelligence in a condensed and interesting style, easily appropriated by the reader, who finds its columns replete with new facts and ideas not obtainable in the books of the past, nor in any other of the journals of the day.

Varied in its carefully compiled and conveniently arranged departments, representing the special and leading industries of the Pacific States—Mining, Mechanism, Manufacturing, Building, Improvements and Inventions—it becomes a weekly informant to all Scientific, Mechanical, Manufacturing and Industrial Progressionists on the coast, an immense list of whom testify to its pleasant, profitable and elevating influence.

Let every friend of Science and Industry on this side of the continent take pride in sustaining and advancing a faithful representative of their special interests by subscribing for the PRESS, and urging its patronage by others—without delay.

Subscription, \$4 per annum, in advance.

25 Fashionable Cards, no two alike, with name, 10c. postpaid. GEO. L. REED & CO., Nassau, N. Y.

PACIFIC BUSINESS COLLEGE, 320 POST STREET, Opposite Union Square, San Francisco.

This institution imparts a first-class Commercial Education, a practical knowledge of Telegraphy, and thorough instruction in the English and Mathematical branches, Penmanship and the Modern Languages. It has ever been a cardinal principle in the management of the College to provide thorough and practical courses of study. Every available modern improvement has been introduced, and whatever energy and liberal expenditure of money could do, has been done to place the institution at the head of similar schools.

LIFE SCHOLARSHIPS

For a complete Business Course are issued at the low rate of \$70. This is the only Business College in the State that employs this liberal system of tuition fees. Day and evening sessions during the entire year. Ladies are admitted into all the departments. Each student receives separate instruction. The discipline at the school is excellent. Graduates at the Pacific Business College find little difficulty in obtaining good situations, being preferred by our business men to the graduates of any similar institution. Those who desire to prepare themselves for the practical duties of life, at the least expense of time and money, should examine the merits of this school before attending elsewhere. Send for circulars.

Among the advantages gained by this holder are the following:

It can be opened and closed quickly.
The points are less obstructed while the articles to be filed are being placed.

The papers (wholly or partly folded) can be either "straddled" over the lower bar, or filed in regular book order.

The elastic hinge and band accommodate and hold firm either a large or small number of papers.

With less material, it is lighter and less cumbersome than other holders, and approaches nearer to bookbinding.

It has no rigid hooks, hinges or loose parts to break or get lost.

It has proved durable in practice. The file is adjusted but 52 times a year for a weekly paper, and a sample holder can be opened and closed 1,000 times without showing wear.

Five sizes are made to suit the dimensions of different papers, viz.: 13, 22, 26, 30 and 34 inches, inside measure. Single samples will be mailed from office for 50 cents, (and upward, according to size), postpaid. Wholesale and retail agents wanted.

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING AND TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony is furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

A. J. SEVERANCE & CO.

Office, No. 320 Sansome street, Room 10.

REGISTER YOUR TRADE

MARKS.

The U. S. Government now offers greater protection than formerly to manufacturers under the law of Trade Marks.

Those who manufacture a superior article, or put up improved packages of merchandise, should protect themselves from imitations by registering their Trade Marks. We have special facilities for securing full rights by the registration of Trade Marks, and our terms are very reasonable.

Consultations free. Many dealers have missed fortunes from not being fully informed and protecting themselves in their rights.

MINING LAWS AND DECISIONS.

Copp's Hand Book of Mining Laws.

In this little work is given the United States Mining Laws and Instructions. Also, a digest of the decisions under the laws, by the Secretary of the Interior and Commissioner of the General Land Office.

Forms are given for making out notice of location, proof of labor, application for survey, and in fact all the blanks a miner needs.

There is also a list of all the mines for which U. S. Patents have been obtained from July, 1860, to August, 1877, with location, township and range.

A handy companion for miners. Price \$1, post paid.

G MAHE, Director,

Musical Instruments.

The firm of Kohler & Chase, of 633 and 635 Clay street in this city, is an old established and trustworthy house, dealing in pianos, organs and all other kinds of musical instruments. They are extensive importers of instruments and instruction books, and have long held an enviable position in this branch of trade. We take pleasure in recommending them to all our readers who wish to introduce the refining influence of music to their homes. The firm make a specialty of the Decker Brothers' piano, the Mason & Hamlin cabinet organ, the Emerson piano and the J. & C. Fischer upright piano. All of these instruments have gained a wide fame for excellence and won high praise from those who know best what constitutes excellence in a musical instrument.

We would speak especially at this time of the Decker Brothers' piano. We cannot do better than present a testimonial of its quality, freely given by a group of musicians whose praise will commend itself to all music lovers. During the Centennial there was held in Philadelphia a grand musical congress, at which the Decker Brothers' instruments were used, and the result was the following straightforward endorsement:

PHILADELPHIA, June 27th, 1876.

The Decker Brothers' Grand pianos, used by the Musical Congress at their grand operatic concerts and musical festivals, recently given at the American Academy of Music, were remarkable for their superior quality of tone and extraordinary power. Fine instruments we never heard. Clara Louise Kellogg, Annie Louise Cary, Zella Seguin, Julia B. Rive, Esmeralda Cervantes, Joseph White, Max Maritzek, P. Brignoli, S. B. Mills, P. Ferranti, Franz Remmert, E. Behrens.

A matter which would make most prominent in this connection is, that the Decker Brothers' name is the subject of attempts at counterfeiting. This is the penalty which the manufacturers of a first-class instrument have to pay for the gaining of a good name, and all our readers should be on their guard against imposition. Unprincipled parties have manufactured and sold cheap pianos under the names of "Decker," "Decker & Co.," "Decker & Brothers," "Becker Brothers," etc., doing business on the reputation and popularity of the celebrated Decker Brothers' pianos. All genuine Decker Brothers' pianos have their name in front on the pianos above the keys, viz.: Decker Brothers, New York. In all genuine Decker Brothers' square pianos the following words appear, cast upon the iron plate on the inner left-hand side of the instruments: Decker Brothers' patent, June 2d, 1863.

The simplest way to guard against imposition is to deal with those who are well known to be trustworthy. Kohler & Chase have a reputation of this character established by twenty years of business experience in this city.—*Pacific Rural Press*, Nov. 1st, 1877.

The Largest and Oldest Music House on the Pacific Coast.

FINE RANCH FOR SALE.

PRICE, \$8,000.

The ranch is situated on the direct stage road between Mendocino City and Cloverdale, in Mendocino County. Forty miles from Cloverdale, 20 miles from Navarro Ridge and one mile from the Christine Postoffice.

It Consists of a Total of 2,000 Acres,

Of which 640 are secured by Government title and the balance by possessory title. It consists of

150 Acres of Rich Bottom Land,

Which is adapted to the raising of Wheat, Barley, Oats, Potatoes, Corn, Vegetables, etc., and will raise as large crops as any land in the county. There is 1,210 acres of Fine Rolling Land which is a No. 1 pasture land, and capable of keeping 1,000 head of Sheep, or 100 Dairy Cows. The whole ranch is well fenced with picket and post and rail fence, and has eight good buildings on it, consisting of a good substantial and comfortable

Dwelling House of Six Rooms,

Two Barns, one of them 100x40 feet, and the other 40x40 feet, a Granary, Woodshed, Chicken House, and a No. 1 Dairy House, new last year. There is a bounteous and never failing supply of good soft water at both the Dwelling and Dairy Houses.

On the ranch is a large quantity of Redwood timber, suitable for all purposes. There is a

Fine Orchard of Some 300 Trees,

Of the choicest varieties of Peach, Apple, Pear and Plum, as well as a large quantity of Grapes, Currant and Gooseberry bushes, and other small fruit. There is 100 acres sown to Wheat and Barley, which is now up four or five inches, and promises an abundant harvest in the fall.

The owner has also about 40 head of Cattle, a few Sheep, five horses, 150 head of hogs, 100 Hens, and a large supply of all necessary Farming Utensils, which he will dispose of to the purchaser at very reasonable terms if desired.

The neighborhood is as good as could be desired, only one mile from a store and one-half mile to a good schoolhouse, as well as one-half mile from a church.

The owner's reasons for selling are his wife's health and his dislike of the business. At the price at which it is offered it is the cheapest ranch in Mendocino County, as the crop bids fair to be worth when harvested, \$4,000.

Terms are \$8,000, one-half cash and the balance secured by a mortgage at one per cent. For full information, address

The Latest and Most Complete Manual.

THIRD EDITION OF

Skidmore's Mining Statutes,

WITH INSTRUCTIONS, DIGEST OF JUDICIAL AND DEPARTMENTAL DECISIONS, RULES OF PRACTICE, FORMS FOR SECURING AND CONVEYING TITLE, SPECIAL STATUTES, AND INDEX.

We have no hesitation in announcing Mr. Skidmore's popular work, as revised and enlarged, the most complete, reliable, and useful Manual of Mineral Law extant. It contains many features not found in other works, such as the Rules of Practice established by the Department of the Interior, the Coal and Saline Acts, the Timber Regulations, and Digest of the most recent and Important Judicial Decisions. The ordinary Forms of Incorporation and Conveyancing of Mining Claims in use in California have been added, and a full Index renders the various matters easy of reference.

The Digest gives the dates of the decisions and reference to the periodicals and works in which they may be found, and the introduction of index words and phrases in capitals and bold-faced letters renders it easy to find at once the particular information needed.

Mr. Week's Commentaries is a more elaborate work, a treatise for the lawyer, but even to those of the legal profession who have that work, this will be a convenient and valuable hand-book.

Mr. Skidmore seems determined to retain the enviable reputation established for his work as the most complete and reliable

Manual of Mining Law.

It is beautifully printed upon the best paper; contains 140 clearly and closely printed octavo pages, and is published at the low prices of \$1 in pamphlet and \$1.50 in law sheep binding.

Send Mailed, post-paid on receipt of price.

119 BEALE STREET, SAN FRANCISCO.

BIRCH, ARGALL & CO.,

Builders of QUARTZ, SAW AND FLOUR MILLS,

Keating's Sack Printing Presses,

THE ECONOMY HYDRAULIC HOIST FOR STORES,

And General Machinists.

Buy the Best.

Before purchasing an American Watch, examine the different styles manufactured by the HAMPDEN WATCH COMPANY, at Springfield, Mass. They are the latest and best improved manufacture. You can depend upon them for fine finish, durability and perfect time. They are sold at favorable prices—in fact, no higher than many of the inferior styles. Examine into the merits of this Watch before you buy any other. Our word for it, you will not regret it.

DEWEY & JORDAN, Agents,
433 Montgomery St., S. F.

THE JAPANESE PERSIMMON.

THIS EXCELLENT FRUIT

SHOULD BE ON EVERY FARM,
AND IN EVERY GARDEN.

I am now receiving regularly from Japan

An Assortment of Varieties
OF THESE TREES,

And can sell them at much less prices than they have
been offered at heretofore. The ages of my trees are

From One to Four Years,

So that fruit will be had on the larger trees in a year
or two.

KELSEY'S NURSERIES, OAKLAND,

OFFICE AND SALESROOM,

Corner Seventh and Washington Streets.

QUARTZ MILL AND MINE FOR SALE.

The Quartz Mine situated on Humbug Creek, Siskiyou
County, Cal., known as the New Eliza Mine, together
with a

Fifteen-Stamp Mill Complete,

A twenty-five horse-power steam engine, and all the ap-
purtenances thereto belonging, will be sold at a bar-
gain if applied for soon. For further particulars apply
to

C. JUNKER,

Bella Union Saloon, Yreka, Cal.

To Ship and Engine Builders, Steam-
ship Companies, Etc.

A Mechanical Engineer, having an extensive experience
in Marine Engineering (especially compound) and Iron
Ship Building, also in Steam Engines and Machinery in
general, is open for engagement. First-class references.

Address and references can be obtained at office of Sci-
entific Press.

25 EXTRA MIXED CARDS, Snowflake, Oriental, Etc.
with 10 cts. J. B. HUSTED, Nassau, N. Y.

To Capitalists & Land Owners

EUCALYPTUS GLOBULUS,
OR BLUE GUM TREE.

We are now prepared to fill orders for BLUE GUM TREES,
for 1,000 to 50,000, and are selling and taking contracts at
Reduced Rates.

We are also prepared to take contracts to plant forests
of from 10 to 1,000 Acres in extent, or to sub-
divide large tracts of land with belts of timber, into 100
acre lots, or any given size required, and furnish and
plant the trees, or will plant avenues of trees from one
mile to any number required, or will contract to plant trees
on any HOMESTEAD or new TOWNS.

We are also prepared to plant forests of Gum Trees on
any of the HILLS in the SUBURBS of SAN FRANCISCO, from a
50-acre lot to 100 acres, or on any of the Sand Hills, after
they have been graded, or if not graded, if fenced,
so as to protect the trees from the drifting sands.

We would also call special attention to the fact that
land can be fenced in with Blue Gum Trees, and the cost is
much less than any other kind of fence, is more durable,
furnishes protection to growing crops, and saves ex-
pense in firewood, which has been fully demonstrated.

To persons having large or small tracts of land, we shall
be pleased to receive appointments, that we may
show them the great advantages of forest culture, and
can make such liberal propositions as will be greatly to their
advantage. Address,

BAILEY & CO., Box 80, Oakland, Cal.

SAMPLE TREES AT OFFICE,

No. 20 California St., San Francisco.

FOR SALE—A Good Type-Writer. Price, \$50
For further information, address "COPYIST," this
office.

\$1,000 Challenge Ore Feeder.

HENDY'S \$1,000 CHALLENGE ORE FEEDER.

I call my Automatic Ore Feeder the \$1,000 Challenge, because I challenge the owners or backers of any other feeder to a competitive test for that amount. As Mr. C. G. Rodgers, Superintendent of the Green Mountain mine, near Greenville, Plumas county, appears prominently as a detractor of the merits of my feeder, and seems confident that another one is better, perhaps he will accept this long-standing challenge which the owners of other patents will not, and give me an opportunity to prove publicly the superiority of my machine. As to Mr. Rodgers' assertion about my feeder wearing out, it is no less fallible in that respect than other machinery; but I have over 250 now in use, some of them for over two years, and have never had to expend 25 cents for repairs. The fact that my feeder received the premium at the late Mechanics' fair, and that I am shipping several feeders weekly to different parts of the country, is sufficient proof of the appreciation in which it is held.

As to my feeders having been thrown out of the Gold Stripe mill, they were not displaced for inefficiency, as the following letter will show, and it answers also as a complete refutation of Mr. Rodgers' statement:

OFFICE SUPERINTENDENT OF THE GOLD STRIPE G. M. CO.,

GREENVILLE, PLUMAS CO., Oct. 16th, 1877.

JOSHUA HENDY, Esq.—Dear Sir:—Your favor of the 15th instant at hand. In reply to your inquiry as to the working of your ore feeders at our mill, we can say that there is no fault in the machines, and we consider them the best now in use. At present they are not in use with us, owing to the construction of the mill, which we are about to rebuild and make proper arrangements for putting in your feeders.

J. K. OWEN,
Superintendent Gold Stripe Mine.

One of the principal owners of the Gold Stripe and Green Mountain mills is also largely interested in the Plumas National mine, where I have just shipped several feeders, showing the confidence placed in the machine by these gentlemen who have used it.

Now, if Mr. Rodgers is sincere in his belief as to the merits of a rival machine over mine, here is a chance for him to make a thousand dollars easily, if he can get the owners of the machine to lend him one for the trial, which is the only doubtful thing in connection with the matter. Mr. Rodgers' eight months' experience with both machine ought to give him confidence enough in his own convictions to accept the challenge offered to him, or any one else.

JOSHUA HENDY.

Corner Fremont and Market Streets, San Francisco.

It may be considered as now fully demonstrated, by careful and long-continued experimentation, that the plan upon which a perfect ore feeder must be constructed is that of the carrier, and not that of the shaking table. Uniform and accurate feeding is not possible upon the latter plan. The ore must be evenly carried, upon a steadily advancing plane or table, to the line of discharge, and there simply dropped. Spasmodic or jerky contrivances will not answer the purpose.

We warrant the machines to give perfect satisfaction, and to be a better and more durable Feeder than any other the market, and will sell them as cheap as any other of its class.

Hand-Book of Arizona Territory,
by RICHARD J. HINTON,
(Of the San Francisco Evening Post.)

This volume is now in press, and will be ready February 1st. It is a large 12mo. of 450 pages, accompanied by a

NEW MAP OF THE TERRITORY.

Compiled expressly for this work. This is the best map of Arizona yet published, and gives the latest mining districts. The volume will be profusely illustrated, containing full page lithograph views of the Loop, at Tehachapi Pass, on the S. P. R. R.; Yuma, Prescott, Phoenix, Florence, Tucson and Tubac; the ancient church of San Xavier del Bac, ruins of the Tumacacori Mission and of Mount Wrightson, and other views of the Santa Rita Mountains. Calabasas, in the valley of Santa Cruz; Comancera Peak, the Ariaca Valley and the ruins of Casa Grande.

Also, numerous other engravings of mines and scenes, comprising Mineral Park, Fort Whipple, Castle Dome, Oatman Flat, the Rio Verde Valley, Montezuma's Well, the Salt River Ruins, Indians, Public Buildings, Ancient Ruins and Remains, etc. In addition to these illustrations, the Hand-Book will contain

An Old Spanish Map of Arizona

And contiguous Territory, never before published; a copy of the famous Father King Map, and profile maps of the Mining District of Mohave County, in which the McCrackin mine is located; of Castle Dome District, Yuma County; of the Bradshaw District, near Prescott, where the Peck mine is worked; of the Pioneer, in which the famous Silver King is located; the Globe, where the Wheatfield, Stonewall Jackson and Miami mines are found; and of the extraordinary rich Santa Rita Districts, the Aztec and Tyndall.

This is the most complete work on a new Territory or mining region ever issued. It is the result of conscientious observation and study, the author having made extended tours through the Territory, and being also in possession of the note-books of mining engineers and explorers, who spent years in examining this marvelous country, which is soon destined to be recognized as the Richest Silver Bearing region on this Continent.

The Hand-Book of Arizona

Will be handsomely printed, profusely illustrated, bound in flexible covers, and sold at retail for \$2 each.

HINTON'S NEW MAP OF ARIZONA, Handsomely colored and mounted, now ready for delivery. Retail, on rollers, for the wall, \$2.50 each; in covers, \$1.50 each.

VOLUME XXXVI.
Number 6.

The Manufacture of Wrought-Iron Pipe.

When hydraulic mining first began to be recognized as an important branch of mining in California, a steady demand for iron piping was inaugurated, which has continued in an increasing ratio ever since. It was soon found that wrought-iron pipe, from its comparative lightness, cheapness and strength, would answer this purpose best, until now the manufacture of this class of pipe has become an important branch of the iron business on this coast and particularly in this city. We now manufacture this pipe in sizes elsewhere unheard of and it is made to carry water under pressures that engineers outside of California would deem impossible. In fact, the use of this class of piping is peculiar to this coast, and considerable quantities of it are now sent abroad from here. In other places, they still manufacture and use the old-style expensive, heavy cast-iron pipe for conveying water, but this riveted wrought-iron pipe is fast coming into universal use on this coast, not only for conveying water for mining purposes, but for city water works, etc. The Spring Valley Water company now use large quantities of it, and at the Virginia and Gold Hill water works it is standing a greater pressure than the pipe of any water works in the world. Very extended experience in mining operations has proved this class of pipe to excel all others for conveying water, so that its use is now universal in that business here and elsewhere.

Francis Smith & Co., 130 Beale street, in this city, make a specialty of this piping and manufacture large quantities of it. During a recent visit to the factory we had an opportunity of examining the process of manufacture and gaining a few points of interest in connection with it. Mr. Smith first began to make this pipe, on a small scale, as far back as 1856, while he was mining in the mountains, and he has continued in the business ever since. He now ships it from here as far east as Denver, Colorado, and supplies it not only to California, Nevada, Oregon, Montana and Idaho, but also South America, Central America and Mexico. Not long since he shipped a lot from here to a mine about 100 miles south of Aspinwall, on the Atlantic side. He continues to make large quantities for this State, most of it being made to order. Among other large companies, he has supplied the Amador Canal company for years, made it for the El Dorado Water and Deep Gravel company, Spring Valley mining company, at Cherokee Flat, and hundreds of smaller companies all over the State. For water works this wrought-iron pipe is fast superseding the old cast-iron piping. Mr. Smith has put in ten miles of this piping at Menlo Park, nine miles for the town of Petaluma, six miles at Santa Rosa, two miles at Cloverdale, three miles at Carson City, three miles at Winnemucca, two miles at Reno, three miles at San Buenaventura, four miles at Santa Barbara, and smaller quantities at other places too numerous to mention. Ten miles of this pipe is used to bring the water to the Northern Belle quartz mill. Mr. Smith is just about to put down a quantity of lap-welded pipe for the city of Watsonville.

American iron is used in making this style of pipe, the process of which is very simple. The sheets of iron are taken to a punching machine, which punches all the rivet holes on the edge at one motion. The sheet is then lapped in a circular form, with one edge over the other, and riveted. These lengths are from 24 to 30 inches long, according to the size of iron, the rivets being proportioned to the size of pipe. The short lengths are passed to other workmen, who join them together by rivets in lengths of from 15 to 28 feet. The short lengths are made slightly tapering, so that one end will fit in the

other. This completed sections are then dipped into a preparation of asphaltum, which coats them inside and out. Long tanks are provided, and the preparation is applied boiling hot. The pipes are dipped and raised out of this bath by machinery. They are allowed to remain long enough to get thoroughly heated before being removed. The pipe thus coated will last underground for at least 20 years. Notwithstanding the dry season large quantities of this piping were sold last year for mining purposes. For supplying hydraulic mines the long lengths of pipe are not riveted together, but simply slipped one end into the other; for water works, however, they require riveting together. The firm sometimes prepare the iron for being made into pipes, and ship it to the ground in that condition, where it is made up.

In addition to the manufacture of this style of pipe, a lighter air pipe for mines is made at these works, in sizes from 5 to 11 inches. It is plain sheet-iron, coated with asphaltum. It is riveted, and made in sections about 20 feet long for convenience in shipment. Large quantities

THE KING PATENT ENGINE.

of this pipe are now made for the quartz mines on this coast.

The firm also make a wrought-iron wheelbarrow of their own patent. The handles are made of channel iron, which is much stronger and lighter than the common gas-pipe handles. The wheel is of wrought-iron spokes, etc., with cast hub. These barrows are very strong and durable and weigh, according to size, from 60 to 95 pounds. They also make galvanized-iron boilers for houses. These are made of a capacity from 25 to 100 gallons. They manufacture at this place, also, the pipes or nozzles for Hoskins' Little Giant, so extensively used in the hydraulic mines. They keep in stock lap-welded pipe, which is used for supplying water to towns. There is some of this kind of pipe in the yard of the factory now, with flanges on each end of the section, so that they may be bolted together and used for pump columns. This was made to order. Most of the material described is kept in stock, but the larger sized pipes are manufactured to order.

MR. JAMES D. HAGUE has been tendered the position of Expert Commissioner in the Department of Mining on the Paris Exposition Commission, and has accepted. No better choice could have been made, as Mr. Hague is eminently qualified for the position by intelligence, education and energy, and his report will be of the highest value to the mining community.

The King Patent Portable Engine.

We present herewith a fine engraving of the King Patent Portable Engine, which is being rapidly introduced throughout this coast, and which is becoming very popular with all who are in need of a cheap yet satisfactory steam power. This engine is manufactured by Hollis, King & Sons, at Corry, Pa., but the agency for this coast is at Nos. 250 and 252 Market street, where the different sizes can be seen. This engine is peculiarly adapted to all the various industries to which small engines can be applied. It is so simple that the common laborer can manage it, and yet so strongly constructed as to resist the severe labors and abuses frequently imposed upon it by ignorant persons who will not take the pains to become acquainted with the use and management of steam power.

As will be seen by Fig. 1 of the engraving, this engine occupies but a very small space. It is made of four different sizes, ranging from two to twelve-horse power. It will be seen that the engine is not connected directly with the boiler, thus avoiding any danger from the explosion or

BOILER FOR KING ENGINE.

contraction of the boiler. As the engine is vertical, it will at once be seen that all side wear is avoided. The Judson governor is used on every engine, and so thorough is every part of this engine made that a first-class steam power is secured at a very low price. By those who have given the King engine a thorough trial it is stated that for use in irrigating the farm lands of this coast this engine is almost indispensable. We are told that it has been proven by actual experiment that a No. 2 King engine will irrigate 40 acres of orchard, raising water from 25 to 30 feet at an average cost for fuel of from 50 to 75 cents per day, and that a No. 3 engine will irrigate 50 acres, raising water from 50 to 60 feet, at an expense not exceeding \$1 per day. These engines are now being mounted on wheels, so as to make them still more convenient for farming purposes.

Fig. 2 represents the boiler used by the King engine. Every boiler is tested at a pressure of 350 pounds to the square inch, before being placed on the market, and every engine is steam-run in order to see that it is perfect. Taken as a whole the King engine and boiler are models of compactness, and for farm use, for mining purposes, printing offices and all of the lighter work where steam power is used, it answers every purpose excellently. Circulars containing full descriptions of this engine can be had by addressing, King & Wilber, 258 Market street, S. F.

California Still a Mining Country.

We notice that some of the Eastern papers appear surprised to learn that California is still a gold producing region, and they apparently labor under the impression that mining has been almost abandoned here. Such ignorance is somewhat lamentable, but probably the fact that Nevada has sent rich mining men to represent her in the National Assembly and no California miners have cropped up in politics, has in part created the impression. California contributed last year nearly nineteen millions in gold to the metallic currency of this nation, and in all probability will make a larger donation this year. A very large proportion of people within her boundaries have also contributed this capital to work mines in Nevada, Idaho, Arizona, Utah, etc., and are still interested in these mines.

In the State itself mining instead of being a retrograde business is advancing. Many people who have tried silver mining with poor success, are falling back again on California mines to make good their losses. They say it takes a gold mine to run a silver mine, and if the reverse of the proposition is also true, silver being worth less than gold, the gold mining ought to pay the best. There were any number of claims started up in this State last year on a legitimate basis which will make a record in the returns of 1878, and hundreds of others were put in a shape to be made more profitable than heretofore.

The gravel mining industry is spreading wider and wider, and as it becomes better understood, pays better. This is to a great degree affected by dry seasons, the same as the farming interests are affected. They must have an abundance of water to work a large hydraulic mine, and in dry seasons the water is of course not available. Now that abundant rains have come, however, the claims are all at work making up for time lost during last season, when the water supply was short. There is one thing about the California miners which is peculiar. They seldom if ever make any great "blow" about their mines—that is in the regular mining sections. In the "cow counties" sometimes if a prospector finds a pretty good prospect he gets some one with more knowledge of cashes than quartz to write it up, and the consequence is an exaggerated report. But in the regular mining sections this is not so. The men go on about their work and rather prefer privacy about their affairs. In most other parts of the coast men are anxious to attract capital to their locality and make a great fuss about any "find" no matter how insignificant. We never hear of any labor strikes among the California miners, or any political combinations. As a class they are peaceable, quiet and prone to mind their own business. Even in the controversy now going on about the debris question, they have done little talking and have taken no pains as yet to put their side of the proposition before the public.

This characteristic is one reason, perhaps, why little is known in the East about the California mining of to-day. The great bonanza on the Comstock has attracted the attention of the world to that locality, and most of the world imagine that the only place on the coast where mining is carried on. We are still at work, however, in California, and although the shallow placers and rich gulches of the "days of '49" are things of the past, we are able to turn out somewhere in the neighborhood of a couple of millions a month in pure yellow gold, a good deal of which we send East for the little things we need here. If mining was stopped altogether in California perhaps some of those people arguing for a return to specie payment in the Eastern States would have to stop talking and stick to their greenbacks.

PACHECO has been unseated by the House.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—E. S.

Idaho Mines.

EDITORS PRESS:—Idaho City lies some 70 miles southeast of Boise City, and is probably one of the richest mineral districts in the Territory. There are numerous ledges of gold quartz of fabulous wealth throughout the county, but those most developed are situated at Red Warrior and the vicinity of Rocky Bar, the county seat. Eighteen miles from Rocky Bar is the town of Atlanta, near which is the famous Atlanta lead. It seems to be the mother lode of the entire range. It is a well defined lead of silver ore 60 feet in thickness. There are at present but three companies operating upon this lead, but they are going for it as though they meant business. The oldest company operating here is the Monarch. They have two mills and crush wet and concentrate with a Frue concentrator and reduce to a value of from \$500 to \$1,000 per ton, and ship to Omaha. The only ore worked at their mills is such as run from \$300 per ton down. The high-grade ore which generally runs from \$500 to \$1,500 per ton, they ship direct to Omaha for reduction. Their annual shipment is from 100 to 200 tons.

The Buffalo company have a tunnel tapping the ledge 100 feet below the surface, and are now sinking a fine shaft of three compartments on the ledge. They are in very rich ore. They also ship their high-grade ore to Omaha for reduction. They shipped last season 115 tons that paid from \$500 to \$10,000 per ton, netting them over \$500 clear of all expenses. This ore must be packed on mules 18 miles, carried on wagons 250 miles and by rail nearly 1,500 miles. They have a 10-stamp mill and furnace, and work here all low-grade ore from \$500 down. They have a large amount of such ore in the dump, more than the capacity of their mill.

The Atlanta company was organized in San Francisco June 23d, 1877, and consists of gentlemen from Boise City, San Francisco and Meadville, Pa. They own 800 feet on the Atlanta lead adjoining the Buffalo. Capt. R. Bledso, the Superintendent, commenced work in July; sunk 230 feet and made two crosscuts; found the ledge 70 feet wide and well defined; found good ore and are now drifting on the ledge east and west. This company have not as yet commenced the erection of works for the reduction of their ores.

There is a branch of Boise river that flows by the town which affords ample water power for all purposes. Timber is abundant on the mountains, and, in fact, every facility for cheap working of ores is at hand. A good road could be constructed down Boise river to the wide, open valleys of Boise and Snake rivers, and with railroad facilities through these valleys, this would soon become a very populous and wealthy country.

The rainfall here since July has been as follows: July, 0.35 inch; August, 0.09; September, 0.27; October, 0.85; November, 2.05; December, 0.01; January (to the 24th), 0.63; total, 4.25. There had been no snow up to that time this winter in Boise City, but since January 24th there has been one inch of snow and two days of rain. A. B. ROBERTS.

Boise City, Alturas Co., Idaho.

New Tunnel Enterprise

In our issue of Saturday we mentioned the formation of a local enterprise, the Eureka tunnel and mining company. It deserves more than a passing notice, as every citizen, having the welfare of Eureka district at heart, is directly interested in its success. The tunnel site is located in Goodwin canyon, upon the east side of Prospect mountain, extending in a westerly direction, and in its line embraces mines from which has been extracted some of the richest ore ever taken out in the district. Ever since the foundation of the district our prospectors and mining experts have been convinced that the practical method to thoroughly prospect the old mountain was by means of a deep tunnel, but it remained for Gen. Connor to devise the method by which it can be done successfully, and almost wholly by our own people.

In conversation with the General, we found he had made almost daily visits to the mines for many months past, during which he carefully examined the formations, the dip of the ledges, and in many instances the broken condition of the ledge matter near the surface, which convinced him, as it does every thorough miner, that depth must be attained to fully determine the wealth believed to be hidden in Prospect mountain. With this end in view, he next sought the most eligible location for the site of the tunnel, selecting the point mentioned as being easy of access, and for the reason that great depth will be attained, and that it will tap veins which have proven very rich near the surface; among these may be mentioned the Piute, El Dorado, Indus, Luca, Mazappa, Magnet, Nil Desperanda, Tiger and Lemon, and in its line it will cross the Industry mine, now being worked by the Hartnett Brothers, who are taking out very rich ore. In many of these, and in others on Prospect, rich ores have been encountered in bunches, but in the majority of

instances the owners have been unable to prosecute work, owing to the heavy expense attending the sinking through the hard rock, and consequently have been compelled to abandon their claims, or simply perform the annual labor required by law to hold them, hoping that at no distant day an enterprise of this kind would be started which would enable them to determine the truth of their experience: that at depth vast wealth lies hidden in Prospect mountain, and also that they might realize from their mines.

The plan proposed to open the mountain is as follows: The company have purchased two mines, the Inca and the Indus which have ore in them; we believe the vein in one of the mines can be struck at the distance of 300 feet, and it is believed rich ore will be found.

The Board of Trustees have set aside a portion of the stock to be sold, the proceeds to be used as a working capital, the whole stock of the company to be forever unassessable or of being assessed and losing their interest. The plan recommends itself as well to the working man as to the man of means, and as it is proposed to dispose of the working stock at \$50 per share, it is within the reach of all.

The names of the Board of Trustees is a guarantee that the business of the company will be conducted justly, and the stockholders have a fair deal, and we hope our citizens will subscribe liberally to the new enterprise and thus not only lend their aid in developing our district, but enhance their own interests.—*Eureka Sentinel*.

El Dorado Quartz Mines.

Our quartz mines have been greatly neglected and the cause can easily be traced to the instrumentality of our own people. Meet one of them in San Francisco, or elsewhere, and inquire regarding our mines; almost universally, they will instantly reply condemning the same, though in doing so they cast a light upon their own prosperity. The facts are, the great gold bearing belt passes through our midst. We have had the richest placer mines in the State, as all know; then, if quartz is the mother of gold, we must certainly have the best quartz, and no doubt we have; but unfortunately we have no local capital, while thoughtlessly, no doubt, we are eternally discouraging outsiders, thereby throwing stumbling blocks in the way of our own prosperity. We have hundreds of gold-bearing lodes that have scarcely felt the touch of a pick. But, as we stand self-condemned, we must make an effort to counteract the baneful impression that has gone abroad regarding our quartz lodes. To do this, a joint stock company should be formed, composed of all business men feeling a common interest in the prosperity of our country. For instance, say 100 men, at \$10 per share, the money to be judiciously expended by a committee selected for the purpose, upon some one of our promising lodes, until it becomes a success. We certainly should have enterprise enough to undertake such a scheme, as it would cost but a trifle for each, and if successful, the benefit would be beyond computation. Capital would come in seeking investment, and we are satisfied, from careful study of the formation of the county, that we would soon rival Amador, on the south, and Nevada, on the north.

The Lord helps those who help themselves. Then why should such an enterprise be longer delayed, when so little could possibly be lost, and the results might bring us millions. Will not some of our energetic citizens take this matter in hand, call a meeting and discuss it, and if possible, organize, and go to work, determined to develop at least one good paying mine in the county. We should be glad to have others, familiar with the subject, express their views.—*El Dorado Republican*.

THE KING COMPANY'S AFFAIRS.—As is well known here, the affairs of this company have been under a cloud for several weeks. To a number of causes may be attributed this trouble, but the principal one, no doubt, was the failure of the wells to supply sufficient water when the furnace was all ready to produce bullion. Following this came dissensions among the managers here and a tardy disposition among the financial backers of the enterprise at the hay to remit the necessary funds to meet the pressing demands on the company here. This led to the company's property being placed under attachment. Thus matters stood, some three weeks ago, when Superintendent Fassett took his departure for San Francisco to consult with the company. Last Tuesday, Mr. Fassett, accompanied by Mr. Sweetapple, arrived from San Francisco, the latter gentleman, we are informed, as Superintendent of the King company, Mr. Fassett having resigned. Unlike too many of our contemporaries, in similar cases, we have no desire to—nor could we in justice do so—speak of the late Superintendent in any other terms than kindly. He has worked hard and faithfully for his company, and we only regret that better results were not attained. If mistakes were made—and they certainly were—we do not think the late Superintendent the party responsible for them. What the future course of this company will be, we do not know at this time, but it does not look reasonable that they will permit their valuable property to pass under the Sheriff's hammer, to satisfy judgment for a few thousand dollars. As yet no move has been made towards an understanding with the creditors.—*White Pine News*.

Russell Hill, Amador Co.

A correspondent of the Amador Dispatch has the following to say about Russell hill in that county, a locality very little known to the general reader:

Well, we are here, living on hope and anxiety; and that hope and anxiety are kept vitalized by the extensive preparations for mining that are being made in this part of the county. As a mining district, this has not flourished to any amazing extent, of late years; but at present there seems to be a renewal of active life and vigor, even among the old settlers—besides, many new-comers have been prompted to locate in our midst. It seems to be a difficult matter to induce moneyed men of San Francisco to leave the stock-boards or let money go out of their hands to invest in any solid or legitimate enterprise. But, nevertheless, and notwithstanding the holding off of the rainy season, this camp proposes to prosper.

Among the gravel mining enterprises, the old Russell hill is going to be swept off by hydraulic power, as it, or part of it, has been sold to a party from San Francisco, by the Hon. David Robinson, who also calculates to erect a hydraulic on the south side of the hill, which will be managed by the McGlofin Bros. The north side will be managed by J. L. Cook, who has things about ready for operation. Should rain fail to come, the same parties will spend their time in quartz mining near here. There is at this time a quartz mine being worked by the Robinson Bros., with as good result, perhaps, as can be shown in the county—the rock being sprinkled over with free gold, and will give a yield of at least \$75 per ton. Besides this, there are many other fine ledges being prospected with splendid results; so you see, if we have not water to hydraulic, we can, with profit to ourselves and county, work quartz. We intend to erect a mill this coming summer that will crush 30 tons per day, with cost of \$2,000, to which will be attached one of the finest concentrators in the world. The mill is to be of the Dawson patent, and the concentrator of the Davis patent. J. L. Cook is agent in this county, for both mill and concentrator.

Montana Furnaces.

Mr. Wm. Purvine, on his way from Glendale to Philipsburg, furnishes us with the following: Glendale is improving and business prospects growing brighter. The plant of the Hecla works comprises two water jackets, of 30 and of 60 tons capacity per day. The copper works are to consist of one three-hearth reverberatory furnace for roasting, and two stacks with two reverberatory furnaces each. The roasting reverberatory, one stack, and one reverberatory connected with it are running, the others being only partially completed. The cupel furnace was completed in November, and some 50 tons of hase bullion are now being melted, the lead being converted into litharge to be used for smelting, the fine bullion being easily handled and shipped. Water jacket furnaces came into use in 1868, and usually the water flows but little above the melting zone, but in these at Glendale the water flows to the top, which is pronounced an improvement on the original pattern. Armstrong has run as many as 400 bars of hase bullion, with an average weight of 90 pounds each, from the big furnace in a single day. His experiments with Butte ores reduced this season, has satisfied him that with his present facilities he can utilize from 4,000 to 6,000 tons of Butte ore per annum. He buys the low grade copper and manganese ores, such as cannot be reduced at Butte, owing to want of works and flux. The cost of transportation is about \$5 per ton. He intends to establish an ore purchasing agency at Butte at an early date.

The Trapper mines are running with about 75 persons in camp.

Murphy & Duffee's mine, in Philipsburg, is reported as looking better than ever before.

PLUMBAGO IN AMADOR CO.—The Amador Ledger says: Spencer V. Carter, who lives near Stony creek, brought to our office this week several specimens of black mineral, which he at first thought to be iron, but which men who have worked in that character of ore pronounce to be plumbago. The ledge is situated at the mouth of Stony creek, near Jackson valley, in a wild looking country covered with chaparral. Sixteen years ago Mr. Carter accidentally stumbled across the mine, and kept the discovery in his mind, believing it would eventually prove of value. After allowing it to remain idle for that long period, the other day, in company with Charles Morrow, who is part owner in the claim, started out to hunt up the ledge afresh, and relocate it. They found the spot after considerable difficulty. A shaft sunk to a depth of only a few feet shows a vein of ore ten feet in thickness—said to be an immense lode for that class of mineral. The samples of rock left with us are soft, easily cut with a knife, and cannot be handled without blackening the hands. Plumbago is commonly known as black lead, and is largely used in the manufacture of lead pencils. It consists principally of carbon, with usually more or less iron mixed with it. From the softness of the specimens left us we should judge that very little iron enters into their composition. Parties who understand plumbago ore informs us that in mines they have worked in, the crude ore has realized \$10 per ton on the dump. Messrs. Carter and Morrow will shortly have samples of the ore assayed, when the value of the discovery will be definitely known.

The Cariboo Quartz Mines.

The Victoria Colonist, of Jan. 6th, contains an extended account of recent developments of rich quartz mines in Cariboo districts.

The whole country extending from Antler to Red galch, although snow-covered to the depth of several feet, is corrugated with snow-shoe and foot tracks. Every old miner is engulging his brains to recall to memory the various quartz ledges he has seen in his prospectings. At the present moment there is an absence of the excitement which characterized the prospecting of early days of Cariboo. The men here go quietly to work with snow-shoes, compass and shovel, and with the latter clear away snow from croppings and stake claims. The favored locality for staking claims the past week has been the ground lying beyond the Black Jack tunnel and the British Columbia company's ground, which is to an extent prospected, as the rock can be seen at a distance of 40 feet below, and from it some rich samples were had yesterday from the drive which that company are making across their lode. The whole extent of ground between the two points above named was staked off, and the prognostications are that the bonanza runs through the ground staked. The character of the rock taken from the British Columbia shaft favors this theory. Another theory prevails, and that is that the Bonanza and Steadman ledges converge at or near the British Columbia shaft, and hence the richness of the ore at that point. The claims lying between the St. Laurent company and Enterprises are par excellence the straight-up bonanza claims. On Grouse creek a number of claims have also been taken up, and rock has been brought from that vicinity which is pronounced by Mr. Inderstroth to be rich. It is of a honey-comb variety, and assays as high as \$78 from croppings. Between the British Columbia shaft and Grouse creek, the Prosperine, Pluto, Diver and Dow companies are at work prospecting the lode. Interests of 100 feet in the three former are held as high as \$1,200, and sales have been made at these rates. Prosperine and Perseverance being the favorites, no interests are being offered. More northerly still are the locations of Geo. Byrnes and Sam Walker, and others. Should these claims all contain bonanza ore, and the character of the quartz justifies the belief, it will prove to be the longest stretch of paying quartz known in the mining world.

On another line are located several claims, prominent among them is the Vivian. This company are at work in the old Jenkins diggings, and it is reported that they have the ledge. The Steadman is again attracting attention through the efforts of the Cariboo Quartz Mining Co., who are running a drive across the lode and are now taking out a class of ore declared by Mr. Inderstroth, the company's amalgamator and assayer, to be far better than that milled last fall from which the first bar was obtained. The Enterprise tunnel is in 100 feet and is pronounced an uncommonly good job. It is estimated the ledge will be struck at a further distance of 160 feet. The Perseverance Co. have run a cut on the ledge and are taking out rock to be tested. The Vivian Co. are cutting into the lode discovered in the Jenkins ground, a distance of 70 feet below the surface, and are also running a cut across croppings above ground. In fact general activity prevails. There are or need be no idle men, as all the companies are doing work of one kind or another on their locations.

LIFE IN BODIE.—Frank McDermot, of this place, has received a letter from E. S. Williams, who went up to Bodie some time ago. "Scotty" does not give a very flattering account of life in Bodie. He writes from Bodie on the 17th instant, and after speaking of what several of the boys are doing, who went from here to that place, he says: "It is storming fearfully and people are flocking here and have neither friends or money. To-night a woman came into town and could hardly find a place to go to; no room for anything or anybody. I cannot for the life of me see what is bringing people here; there are 10 for every job. This is a hard place; the thermometer is sitting opposite me on the table, four feet from a red-hot stove, and registers 62°; the wind howling, the snow falling and drifting make altogether a very dismal picture, and prompts one in comfortable quarters to pity the homeless and homeless. Every space large enough to contain a human being is filled; saloons and lodging houses are full and lots of all-night stove-warmers up at the mill, where they stand in the furnace-room to keep from being frozen. I would not advise anyone to come or stay away; let all do as they choose, then they will be satisfied."—*Coso Mining News*.

ADDED MACHINERY.—The Eureka company are adding a large amount of machinery to their mine and have a still larger lot on the way from San Francisco. The piping will be used to convey power from the surface to the lower drifts, to run the small engines used down in the depths of the mine. These latter are employed in raising ore, driving drills and otherwise facilitating the economical work of sinking winzes, running crosscuts, etc. It is a busy and interesting underground scene, and the process of developing and extracting the great ore bodies employ a multitude of men day and night. We are informed that the mine never looked more promising and its immense resources have been hardly drawn upon, a fact that is full of promise, not only to the fortunate shareholders but also to every resident of Eureka.—*Sentinel*.

MECHANICAL PROGRESS.

Centering Work for the Lathe.

In his articles on tools and their uses in the *Polytechnic Review*, Prof. Sweet, of the Cornell Mechanical School, writes at length of the way to secure an accurate and durable "center" in pieces of work for the lathe. We shall quote therefrom some of his positions on the subject which are, we think, suggestive: After the ends are centered with the center punch and found to be sufficiently near the center for the purpose, small holes should be drilled in the ends of the piece below where the points of the lathe-centers are expected to penetrate. Care should be taken to have these holes as true in line with each other as possible. I have not been able to find or devise a rule for determining the proper size of these holes. In fact, materials and circumstances are so varying that there would be so many exceptions as to render a general rule worthless. Why the holes should be drilled extra deep is because they then tend to wear ton fit on the lathe-center; whereas, if a lathe-center strikes the bottom of the hole it soon wears a loose fit and the piece no longer revolves true. The center holes should then be counter-sunk just enough to enable the ends of the pieces to be squared off truly in the lathe, which should be done, and the holes again counter-sunk deep enough to give a proper bearing on the lathe-centers. Why the first counter-sinking should not go deep enough to render the second operation unnecessary is this: If the end of the piece is not square the counter-sink will not follow the center hole, but will cut off one side more than the other; then, when the other end is squared off, there will be a wider bevel on one side of the hole than the other; so that as the center wears, the axis of the piece is constantly changing; for the same reason that the end of the piece must be squared off the first thing. If the last counter-sinking could be done perfectly true with a center-punch instead of a counter-sink, the center holes would probably be more enduring and better; but without a guide it is difficult to do.

In centering steel that is to be hardened and ground, a true conical counter-sink is not the best form; for in hardening the center may change to an oval form, and when ground the outside of the piece may be equally oval. To obviate this, a center punch, "three-lobed" in section, should be driven in so as to leave three bearing surfaces in the counter-sink, which will always fit a conical center and be free from shake. When the last counter-sinking is done, it is true with the center hole, true with the end of the piece, and stands a better chance of wearing true than it would were not these precautions taken. So, too, in boring holes in pieces chucked to the head-stock, the work should be faced off before commencing to bore, not only because a true hole cannot be bored without so doing, but also to remove the scale from the iron, avoiding dulling the boring-tool every time a new cut is commenced.

Absolute truth is so near an impossibility that to approach it, it is necessary to observe every precaution; and when a piece of work has to be operated upon from both ends, no part of it should have the finishing cut taken until it has all been roughed off, and the piece changed ends once or twice during the operation. This, not only because the piece is liable to spring from the removal of the outside, but because the centers should be worn to their seat. In preparing pieces to be turned on centers they should, in every case possible, be cut to the proper length at first, so the centers will remain in when the work is finished.

WIRE FROM AMERICAN IRON.—Richard Akerman, of the Stockholm School of Mines, warns the Swedes that the Americans are making wire of their own iron. He says that Washburn and Moen substitute iron made in Pennsylvania and American Martin and Bessemer iron, for iron previously imported from Sweden, so that while they formerly imported yearly from Sweden for their wire works about 4,000 tons, they took in 1876 only 1,000 tons Swedish iron, the use of which is now limited to the nicest applications, as gun-screws, etc. That the Lancashire iron which they make is exceedingly good was shown by their splendid exhibit at Philadelphia, which, among other things, contained a bundle of wire, made from their own Lancashire iron, of the fineness No. 43, which bundle only weighed 11½ pounds, while the length of the wire was 21 miles. There was also a bundle of wire weighing 526 pounds, with a diameter of 3-16 inch, and a length of 5,402 feet.

HINT FOR BORING A DIAL.—The following method is very simple, but, says the *Jeweler*, some watchmakers are not familiar with it: Take a sheet of paper the size of the dial and glue it on to the dial plate after cutting through the paper an opening corresponding to the engraving, etc., which is required. Make the holes of the required size with a graver; the etchings can be made and the angles rounded with crushed pumice, and then the whole polished with enamel powder or diamantine. Then place the plate in water and the paper falls off. By this method there are no scratches on the dial.

The Year in Iron and Steel.

The year 1877 has seen an increased demand for our iron and steel products as compared with 1876, neutralized, however, so far as producers were concerned, by a very marked decrease in prices, a result which not only prevented an increase in the wages paid to labor, but, in some instances, compelled still further reductions. The *Bulletin of the Iron and Steel Association* says:

We have referred to the consumption of iron in 1877 as having been larger than in 1876. This increase, we believe, applies to all branches of the trade, excepting, perhaps, iron rails, and including all steel products. Of the fact that there really was an increased consumption there can be no doubt, but how great was the increase we shall not know until our returns of production for the year are received. It seems certain that the conversion into marketable products of old rails and scrap iron was greater in 1877 than in 1876. Fully as much pig iron was manufactured in 1877 as in 1876, and we think about 10% more. The product of 1876 was 2,063,236 net tons. In 1875 the product was 2,226,581 tons. The product of 1877 will closely approximate if it does not slightly exceed that of 1875. The stocks of pig iron on hand and unsold at the close of 1877 are less than similar stocks were a year ago. In the Lehigh valley they were much less. All these facts and conjectures, which will be sustained by the official figures, confirm the impression that there was an increased consumption of iron in 1877 over 1876.

The production of Bessemer steel in 1877 was as great as the product of 1876, which was 525,996 net tons of ingots and 412,461 tons of rails. The production of steel rails in 1877 will not vary greatly from 450,000 net tons. The production of iron rails in 1877 will not vary greatly from 450,000 net tons. The production of iron rails in 1876 was 467,168 net tons, which was hardly equalled in 1877.

The imports and exports of iron and steel in 1877 corresponded very close to the imports and exports in 1876. There has been no change in the quantities or values of either imports or exports that is worthy of special mention. Notwithstanding all that has been said about an increase in our exports of manufactures, the aggregate of our exports of iron and steel, and of locomotives, machinery, car-wheels, cutlery and other iron and steel products did not materially increase in 1877 over 1876. It is a consolation, however, to know that our imports of iron and steel did not increase.

A NEW CLOCK AT THE NAVAL OBSERVATORY.—Commodore Dimpel and Mr. Sloane have invented a new astronomical clock, which is now being introduced into the Naval Observatory at Washington. It has a mercurial compensating pendulum, but the novelty consists in this, says the *Jeweler and Silversmith*: Every time the pendulum vibrates its lower point, made of platinum, passes through a globe of mercury, and this contact establishes a connection with a voltaic battery, arranged in such a way that every time the contact is made a ratchet wheel with teeth will move one ratchet and produce a tap. At the tenth ratchet a platinum arm dips into another drop of mercury, making a circuit with another sounder giving a louder tap, so that every 10 seconds the louder tap helps in counting the number of seconds. It is stated that by this arrangement an observer is enabled to rate chronometers to half a second, and by continued ratings the computation of errors may be reduced to an infinitely small fraction—in fact, it is claimed that the operator can rate chronometers as fast as they are put before him; but this is evidently an exaggerated statement.

AN OLD IRON CAR.—The private car of President Cass, of the Fort Wayne road, which has the number "100" inscribed on it, was built 25 years ago. It is constructed entirely of iron, and has been repeatedly thrown from the track and rolled down embankments, and never yet been damaged to the extent of an indentation. Wooden coaches have been "telescoped" and gone to smithereens all around it, and it has always come out without a scratch. But it is an oven in summer time and a refrigerator in winter.

HARD BRONZE.—The ancients used brass, or rather bronze, for cutting instruments, and added tin to the brass to make it hard. Copper and tin alone is too brittle; copper and zinc too soft; but these three metals make a very hard alloy. Experiments by Chautry in England have proved that the proportions to obtain the hardest alloy are 5 parts of tin, 5 of zinc, and 32 of copper. He even made a razor of this alloy, and it proved almost as hard as tempered steel; files would not touch it, except when they were quite new, and then they were soon destroyed.

WOOD AND IRON.—Herr Hirn has been conducting a series of experiments, in Germany, on the comparative strength of wood and cast iron in their different applications, and finds that in a great number of cases the former has the advantage. Prof. Hirn finds the strength of wood to be in direct ratio to its density and this strength is increased by immersing the pieces of wood in linseed oil, heated from 185° to 212° Fahr., and letting the wood thus immersed remain for two or three days, or until partially saturated.

SCIENTIFIC PROGRESS.

Aerial Telegraphy.

We have already given items concerning the system of telegraphing without wires, which is put forth by Prof. Loomis. Doubtless a fuller description of his experiments and results attained and anticipated will interest many readers: Prof. Loomis has been in the mountainous regions of West Virginia for some months, conducting a series of experiments with his proposed aerial telegraphy, has demonstrated finally that telegraphy without wires is practicable. His manner of operating consists of running a wire up to a certain altitude, reaching a particular current of electricity, which, according to Prof. Loomis, can be found at various heights. At any distance away, this same current can be reached by a wire, and communication can be had immediately. The apparatus necessary to bring about this wonder is very simple and inexpensive. It has been fully ascertained that telegraphic communication does not take place over or through the wires, but through the ground. This same communication continues when these electric currents applied by nature are used. Prof. Loomis has telegraphed to parties eleven miles distant by merely sending up a kite at each end of the distance, a certain light, attached to which, in place of the ordinary string, was the fine copper wire. When both kites touched the same current, communication was had between them, and messages were sent from one end to the other by means of the ordinary Morse instrument in connection with the instrument invented by Prof. Loomis. This showed that the theory on which he had worked for many years was the correct one, and that by the proper means, such as stationary wire arranged from natural or artificial eminences, could be operated successfully at all times. It is true that aerial telegraphy may not be much of a certainty during violent storms or electric showers, but it will not meet with more obstructions than the ordinary wire telegraphing, which is not at all sure during the periods spoken of. It will be a long time before aerial telegraphing can be carried on between places which are but a short distance apart, if indeed it ever will. In such cases the wires will continue to be used, though for long distances, such as for telegraphing from one side of the ocean to another, the aerial telegraph will take its place entirely. Prof. Loomis has a scheme now on foot for a series of experiments from a point on one of the highest peaks on the Alps, in Switzerland, to a similarly situated place on the Rocky mountains on this side of the world. If this succeeds, of course his invention will rank in importance with that of the electric telegraph itself, and be even greater than that of the telephone. All of the money necessary to carry on the experiments has already been promised, and it will not be many years, if it turns out to be a success, before ocean cables will be one of the lost arts, which, having played its part, will be laid aside. The cost of aerial telegraphy will not be over one cent when the other is \$1,000.

ACTION OF THE TELEPHONE.—Prof. Barrett delivered a lecture "On Telephones," at the London Institution. He said the first idea of conveying sound by artificial means was credited to Dr. Hooker, in this country, 210 years ago, and the accomplishment of reproducing articulate speech by electrical means to Reiss, a German schoolmaster, in 1851, of whose experiments some notes were read, communicated to the lecturer by Dr. Messel (who had been Reiss' pupil). Gray's discoveries and instruments were noticed, as also Varley's musical telephone. Prof. Graham Bell's speaking telephone was finally introduced and its action explained, the lecturer attributing the sound-producing vibrations in the receiving disc to exceedingly minute mechanical motions, mechanical vibrations of 1-25,000,000 of an inch being equal to the production of an audible sound.

METRIC SYSTEM.—Congressman Marsh has introduced a bill providing that on and after January 1st, 1879, for all postal charges 15 grammes shall be substituted for one-half ounce, and so on in proportion; that the Postmaster-General shall furnish all postoffices with postal balances denominated in grammes of the metric system, and that on and after January 1st, 1880, the metric system of weights and measures, as legalized in the Revised Statutes, shall be obligatory. Marsh also introduced a bill to establish the metric system in the coins of the United States, and provide for and regulate coinage, including the new coin-metal called gold.

INFLUENCE OF ORGANISMS ON EGGS.—MM. Beauchamp and Eustache have determined that eggs may remain for long periods in a medium filled with infusoria, without the latter traversing the shell and penetrating the interior. The shell, however, allows the passage of microscopic mucedinae, which make their way through the lining membrane and develop very abundantly on its internal face. The membrane surrounding the yolk presents, however, an insurmountable barrier to their further progress, but should their entrance into the yolk be effected an alteration takes place, which is a true fermentation, and distinct from putrefaction.

Electricity and Capillary Attraction.

Dr. J. W. Draper makes the following observations upon the development of electricity as modified by capillary attraction:

When a glass plate is laid on the surface of quicksilver, a considerable force is required to separate them. On the separation being made, if the substance be examined by the electroscope, the glass will be found to be electrified positively, the mercury negatively. Their attraction or adhesion is, therefore, a necessary electrical result. So intense is this electrical development, that if, during the act of separation, the mercury be in connection with a gold leaf electroscope, the gold leaves are commonly torn asunder.

In like manner, if some melted sulphur be poured into a conical glass and permitted to solidify, on making the separation the interior of the glass and the solid sulphur cone will be found to be in opposite electrical states. And the same occurs when surfaces of various kinds are parted from each other. There ought, therefore, to be adhesion.

But if a glass plate be laid on a surface of water, there is no apparent development of electricity on separating them. And the reason is obvious, for the glass has brought away with it a layer of water, and there has been no true separation of the solid from the liquid, but only of water from water. The force of adhesion of the glass to the water has exceeded the cohesion of the water for itself.

If a plate of polished zinc be laid on mercury, there will again be no electrical development apparent on separating them. For, owing to the conductivity of the zinc, there is nothing to prevent the opposite electricities from uniting, and all electrical manifestations must cease.

Whatever can disturb the electrical relations of a solid and a liquid will disturb their capillary. On wetting the interior of a glass tube, so as to form a temporary tube of water, and placing some mercury in it, the mercury will be depressed below the hydrostatic level. But on connecting the mercury with the negative pole of a voltaic battery, and the water with the positive, the mercury at once rises, their mutual attraction being increased.

The Carrying-Power of the Glaciers.

In North America, and especially throughout the Northern States, the boulders are numerous, often of very great size, and indicating transits of many miles. In an article on the "Ice Age" in the *Popular Science Monthly* the following occurs: Over the Eastern, Middle, and Northwestern States, boulders, that have emigrated from distant points northward, occur in such abundance that they may almost anywhere be found if the inquirer will only examine the country he passes over. Upon Mount Katahdin, in the Moosehead region of Maine, stones can be seen, lying over 4,000 feet above the sea, fossiliferous in their nature, and coming from northern sites; while toward Mount Desert masses, some 40 to 50 feet in height, are sprinkled everywhere, and, as in the case of the Dedham granite distributed to the south, invariably show northern origin. In Berkshire county, Massachusetts, these traveled rocks lie in long alignments, passing over the Lenox hills, and extending in a generally southeasterly direction for 15 or 20 miles, and have been filched from the Canaan and Richmond hills across the line in New York, being of chloritic slate, with angular specimens of limestone intermixed. Some granites from Vermont, on the west of the Green mountains, have been lifted over these barriers and transferred to the southern margins of Massachusetts; while in Vermont, a boulder weighing over 3,400 tons, and known as the Green Mountain Giant, has been drifted across the valley of the Deerfield river, and planted 500 feet above that stream. In Michigan, near the Menominee river, a field upon the northern slope of a mountain is densely covered with boulders, so that a mile can be traversed without once touching the ground. Again, huge nuggets of copper, torn from the immense deposits of native copper at Keweenaw point, Portage lake, and the Ontonagon district, on the southern shore of Lake Superior, are found widely disseminated to the south of these localities in Michigan, Wisconsin, Ohio and Minnesota, a few of which have weighed 300, 800, and one 3,000 pounds.

GOOD HAUL OF FOSSIL FISH.—During the last summer vacation Prof. Edwin R. Lewis, of the Syrian Protestant college at Beirut visited a fossil fish locality on Mount Lebanon, and succeeded in getting permission to work at it. He remained about two weeks, with a number of workmen, and obtained, doubtless, the largest and finest collection ever made at the mountain. The specimens are the most superb ever seen, both of species formerly known and many new ones, thus discovered by him, besides many perfect specimens of species hitherto known only by imperfect examples or fragments. He brought away about 5,000 selected slabs, some of the slabs actually containing hundreds of specimens. The German paleo-ichthyologists express great astonishment at the results of his work, which, especially in Selachians, surpass, in their opinion, anything before known.

MONUMENT TO LINNÆUS.—It is proposed to erect at Stockholm a monument to Linnæus, consisting of a statue of the great naturalist, surrounded by allegorical figures of the four sciences to which he devoted himself, namely, botany, zoology, mineralogy and medicine.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

AMADOR.

CANAL REPAIRED.—The big break in the Amador canal, last week, near Bald Rock, which carried away 200 feet of the embankment, was repaired on Sunday. In places the soil was washed away to the depth of 30 feet. From eight to 10 men were employed nearly a week in mending the break. A substantial flume now conducts the water over the scene of the disaster, so that mishaps are not likely to occur again in that locality. The mills working by water power were shut down from Wednesday to Sunday, but everything is now moving along smoothly once more.

PENNSYLVANIA.—The new 10-stamp mill of the Pennsylvania has been crushing ore for the past two weeks. It is a very complete piece of work, fitted up with every convenience. Altogether about 200 tons of rock has been crushed, the output of gold so far reaching the gratifying figures of \$15 per ton. The mine is looking well, so much so, that 10 more stamps are to be added to the mill forthwith.

PLYMOUTH.—A great many prospectors are out prospecting up and down the creeks and gulches with more or less success. We hear of one party who has found the "color" to the amount of \$30 per week—gravel claim—about two miles north of Plymouth.

BOULDER FLAT MINING.—Amador *Dispatch*, Feb. 2: Barher & Baker have two little giants operating at full blast upon their Boulder Flat gravel claim, near the old Pioneer mill, a short distance from Volcano. There is no longer a scarcity of water with which to operate.

HOISTING WORKS COMPLETED.—The hoisting works of the Moore mine have been completed and put into operation. It works well and we may soon expect to see the mine one of the paying institutions of our county.

DITCH CONTRACT.—The contract for digging a ditch from Kennedy Flat to the Monterichard mine was let to Mr. E. Muldoon, last Tuesday, at 70 cents per rod. The ditch will be two feet wide at the top and one foot at the bottom by 18 inches deep, and will be about 280 rods long. Besides this ditch, the water will be conveyed some distance by natural channel and through iron pipe.

A GOOD YIELD.—Joseph Leduc had 50 tons of quartz, taken from his mine, a few miles east of Volcano, crushed at Mace's mill, last week, which yielded over \$1,300.

PREPARING FOR WATER.—Mr. F. Mace is having one of Knight's large sized patent water wheels put up, with which to run his saw and quartz mills, to take the place of steam power, now in use.

IRON PIPE.—Two large loads of iron pipe passed through town, last Tuesday, for Payne & Co.'s gravel claim, near Moon's ranch.

CALAVERAS.

GOOD ROCK—MINE SOLD.—Calaveras *Chronicle*, Feb. 2: Returns from the upper county, with regard to quartz mining, continue of the most favorable character. We hear that 46 tons of ore, taken from Gass & Co.'s mine and crushed in Garland's mill, at Mosquito, averaged about \$15 per ton. That is in keeping with the previous yield of the mine, which has paid steadily and largely from the outset. We understand that negotiations for the sale of the mine, which have for some time been pending, were lately closed. Taken altogether, the mining interests of the country never looked so favorable as at present.

GOLD BRICKS.—That the yield of the mines in this vicinity—both gravel and quartz—have been abundant since the rain set in is fully attested by the number and diversity of gold bricks to be seen at the office of our hanker and assayer, C. Schlund, Esq. Almost every day bars of refined gold come from the furnace, varying in weight from what constitutes a pretty good lift for a healthy organism down to diminutive ingots of the value of \$5,000 or \$6,000. We doubt if there is another county in the State now producing as much gold as Calaveras, and a large proportion of the metal passes through Mr. Schlund's hands.

MILL STARTED.—The mill at the Enterprise Con. mine, near West Point—an eight-stamp battery—was started recently and will be kept in constant operation in the future. We understand that there is about 300 tons of ore on the dumps of the mine, which, together with the daily yield, will keep the battery in uninterrupted operation.

UPPER COUNTRY JOYS.—The Champion, at West Point, is still sinking. Shaft is now 380 feet deep, the ledge showing over two feet wide. Gouldson & Smith, proprietors of the Pride of Bummerville, have struck it rich at the depth of 40 feet. Ledge about two feet wide, every pound of which will pay an average of \$45 per ton. Maunidu & Potter have discovered a new vein, about a mile from West Point, that promises well. Enterprise Con. is stopping. The mill is running. The hoisting works, for some time past in process of erection, on the Sunderland mine, at Independence, to replace those burned some time since, are completed and in operation. We understand that Garland's mill, at Mosquito, is running on San Bruno rock.

EL DORADO.

THE ROSE MINE.—El Dorado *Democrat*, Feb. 2: Work will soon be commenced on the Rose mine, just south of this city. Hoisting works

are now in course of erection, and we are told that work will be pushed right ahead. Thanks to the energy and enterprise of C. W. Brewster, Esq.

ON DIT.—That arrangements are being made to recommence work on the old Pacific mine, on the hill just south of town. This is, we think, one of the finest quartz ledges mother earth ever produced, and we sincerely hope that rumor may prove true, and that this famous old mine will be thoroughly tested. There is great wealth in the Pacific, and yet it will require considerable time and money to get at it.

THE UNIONTOWN BONANZA.—A few weeks ago, Sam Stuckslager and Nathan Plumtree, the owners of a porphyry claim near Thompson's hill, a short distance south of Uniontown, gave Oscar Oshorn and Joe Blundie permission to prospect the lead, on condition that the projectors should have half the proceeds. After working a short time a pocket was struck which promises to be one of the richest ever discovered. The quartz is of a friable character, easily broken up, and the proportion of gold is simply enormous. In one day enough rock was taken out to yield, when crushed, nearly \$15,000. The shaft has been driven to a considerable depth, but is not yet through the pocket, nor has either end been found. Mr. Lohry, merchant at Uniontown, a very reliable gentleman, who has examined the mine, estimates that there is \$250,000 worth of rock in sight. To say that the parties in interest are delighted don't half express it. Other prospectors are on the ground diligently searching for the continuation of the ledge.

THE KEENAN MINE.—A company, composed of seven of our most prominent citizens, namely, H. L. Robinson, Thomas Fraser, C. H. Weatherwax, E. F. Woodward, Dan Wickham, and John Blair, hounded the above named mine, on Friday last, for \$5,000. Some work was done on this ledge a number of years ago, and it is said to have prospected well, but for some reason work was suspended, the mine falling into the hands of Edward Keegan, Esq. Mr. Keegan refused, three years ago, ten thousand dollars in gold coin for his mine. Work was commenced at the old tunnel on Saturday last, and Superintendent Wickham informs us that he will soon have a gang of men at work on top of the hill, sinking a shaft.

INYO.

BULLION SHIPMENTS.—Coso *Mining News*, Feb. 2: The shipment of bullion from this place by Wells, Fargo & Co., were much lighter for January than for the preceding month of December. The total for January is: Emigrant M. Co., \$6,150; Sheldon M. Co., \$1,000; one bar from Minnietta Belle M. Co. (attached by John R. Hite), \$650; gold bullion by Mexicans, \$300. Total, \$8,100. The falling off is due to the extreme cold weather, by which water pipes, springs, etc., were frozen up, causing a stoppage of the mills. There will undoubtedly be a large increase the present month in fine silver bullion, and we expect to record, also, shipments of crude bullion from two or three, perhaps four, furnaces.

NEVADA.

BIG CLEAN UP.—Grass Valley *Union*, Feb. 1: We noticed, not many days ago, the fact that a rich ledge had been struck in the Centennial mine, on Oshorn hill. Since then a crushing of this rock has been made with a splendid result, which we give below. For a time the Centennial yielded richly from the vein found on the foot-wall, but as the work was continued downward the rock became poor, and the prospects were discouraging. A few weeks ago, it was discovered that the ledge was split, a portion of the vein running into the hanging wall. This was prospected and found to be very rich, and larger than the foot wall ledge, and continues to hold its good appearance, with every probability of continuing. The crushings that were taken out were partly company rock and partly tribute rock, and were as follows: 26 loads company rock, \$117 per load; 9 tribute, \$147 per load; 12 tribute, \$100 per load; and 4 tribute \$133 per load—making an aggregate of the yield from the first crushings from the new strike, of \$6,297. The hanging wall ledge varies in width from six to 10 inches, and where smallest is exceedingly rich, and would go \$250 or \$300 per ton if not mixed with the rock taken from the wider portions of the vein. The main incline is down nearly 400 feet, and this rich rock is taken from the slopes of the bottom level.

THE GRASS VALLEY NEW M. Co. have a regular ledge in their drift, 104 feet east of the incline, which is down 200 feet. The walls are regular, and it is believed now that the ledge will be permanent. Heretofore the ground has been broken up, and no regular formation was found. The ledge found is about eight inches wide, but gives indications of growing as it is drifted on. The quartz shows well in sulphurets. A good paying ledge in that ground would give great encouragement to adjoining locations. A heavy rain prevailed yesterday giving the miners another installment of water. The indications are favorable for more.

NEW ENGLAND MINE.—Nevada *Transcript*, Feb. 2: The incline of the New England mine is now down about 350 feet, and the drifts on the lower level are in, respectively, 150 and 350 feet. Two shifts of eight or nine men each are employed, and together they take out about 20 tons of rock per day. There is now about 80 tons of quartz on the dump, which it is safe to say will crush \$25 to the ton. The prospects of this mine have greatly improved of late.

THE NEW BRUNSWICK M. Co. raising rock from the same level as the New England, is

meeting with very fair success. There are now from 40 to 50 tons of good looking rock on the dump.

HUNTING A LEDGE.—The Pioneer Reduction Co. is at present engaged in sinking a "blind shaft" to tap the ledge recently hounded to that corporation by Messrs. Jones, Cashin and Morgan. It was not long since struck but a short distance from the present field of operations, and just northwest from Maltman's sulphuret works.

PIONEER REDUCTION WORKS.—The sulphuret mill of the Pioneer Reduction Works has started, and within eight or ten days the enterprise will be in full blast. They are now working the first lot of about 45 tons from the New England mine.

LITTLE YORK TOWNSHIP.—Dutch Flat *Forum*, Jan. 31: On Remington hill, the Rhode Island company have been hydraulicing for over a week. A fair head of water is being utilized to good advantage. Twenty-seven men are steadily employed in the Wide West mine. The drifts continue to look splendid, and are paying well as usual.

LOWELL HILL.—The Swamp Angel company have again resumed operations with a full force of miners. Work is progressing night and day, with 20 men employed in the drifts. The gravel taken from the breasts is said to be fully as rich as any worked heretofore. The work of advancing the various headrock tunnels in this vicinity is under continual progress.

THE LIBERTY HILL COMPANY are washing with two streams, one on the upper and the other on the lower strata. About 1,500 inches of water is used. The working of the two stratas in connection with each other proves of great advantage. The Union mine is also washing, using 800 inches of water.

LITTLE YORK.—The pipes and flumes of the Little York ditches being repaired they are now running about 1,500 inches of water, which is utilized in working the Empire and Christmas Hill mines.

A You Bet correspondent says: You Bet has taken a start again. The late rains have started the mines once more. The English company have been washing for some time at Brown's hill. They resumed washing at Red Dog on the 27th, and will be ready to turn on at the Walupa mine in the course of a week, as a shaft is being raised for that purpose. The Nevada or Hayward Co. are running two claims and will be ready to start up the third in a few days. Washing was resumed in the Hussey mine on the 28th. With nearly 100 men employed in the mines it will be seen that the prospects for a lively camp after a little are quite flattering. It is pleasant to see a change approaching so closely, as our business men have been looking very gloomy for the past few months.

PLACER.

BAKER MINE.—Dutch Flat *Forum*, Feb. 3: The Baker washes six hours a day, using 1,600 inches of water, and employing 12 men, who are kept busily engaged throughout the day in breaking holders and pulverizing cement. North Star No. 2 washes four hours a day, using 400 inches of water, and employing five men. The Franklin, through the aid of a monster derrick in removing the large holders, is making a splendid showing. Twelve men are employed, and 1,000 inches of water used four hours a day. The Polar Star and Southern Cross are utilizing 2,000 inches of water alternately, each washing six hours a day, and employing 40 men. This company expects to clear sufficient headrock in about three months to admit the working of derricks, when they will be enabled to make better progress at much less expense. Washing in the Central mine is progressing without cessation, using 700 inches of water, working two shifts, and employing seven men. No holders.

GOLD RUN.—The Gold Run Hydraulic Co. (Limited) is washing 24 hours a day, utilizing 800 inches of water, and employing 11 men. The Miners' Ditch Co., owing to a scarcity of water, is not making the contemplated progress, washing but 10 hours a day, using 1,800 inches of water, and employing 15 men.

SHADY RUN.—The Wild Yankee was enabled to resume hydraulicing last week, while hostilities on the gravel banks are progressing to good advantage. A large force of men are employed in the drifts of the North American Co. The breasts are looking splendid. Several men are employed in running tunnels in the Blue Bluffs and Hobbs Co.'s claims, two drifting mines that have been lying idle for some time. Mr. Jake Aheal is the Superintendent and principal owner of the former, and a Mr. Hohls, of Virginia City, the proprietor of the latter.

THE Ritchie mine, on Bear river, is being systematically worked under the supervision of Mr. Ritchie himself. He informs us that the mine is now paying well, last week having yielded an average of \$10 per day to the man. Since commencing work the present season the claim has paid \$4 per day to the man, which is good wages these hard times.

SHASTA.

IGOO TREMS.—Cor. Reading *Independent*, Feb. 3: We have had an unusually heavy fall of rain here for the past week. The miners now have all the water they can use. The Hard-scrabble mine is now running five Little Giants day and night, with quite a large head of surplus water running over the bank. They are now blasting out another ditch in which to put extra boxes.

SIERRA.

BRANDY CITY.—Mountain *Messenger*, Feb. 2:

J. M. Hickey informs us that he has had a good head of water in his diggings for a long time. The cold weather hothered him some, compelling him to turn the water out of some of his flumes to prevent them from freezing full of ice.

BRUSH CREEK MINE.—This mine is now fairly opened, and the mill running steadily, though we believe not on the richest rock. The shaft is down 700 feet, in a ledge about three feet in width, with well defined walls on either side. Dave Quadlin brought up a specimen of the rock, on Sunday, which is the finest piece of gold-bearing quartz we have ever seen, and we have been shown many valuable specimens in our day. The specimen weighed about two pounds and contained fully \$50 in gold. Quartz of this character is valuable for working up into jewelry, and is very scarce.

MORRISTOWN.—The late storms of snow and rain have started the water in this place, and the American company's mine, owned by J. H. Thomas, of La Porte, has been running four monitors, day and night, for the last three weeks, and the high gravel banks are fast disappearing before these large streams of water. The prospects for a good season were never better, there being now four feet of snow here and six or eight at the head of the ditch. With the usual spring storms, we will have a good mining year.

Nevada.

CORNUCOPIA DISTRICT.

THE MINES.—Cor. *Silver State*, Jan. 29: Quite a change has occurred here within a short time past. At the Leopard, Coffin has been superseded as Superintendent by George Willard. The mine is prospecting well, according to all accounts that I can get hold of, and from their own ore they will make an increased bullion shipment this month. Probably it will reach \$40,000, at least. The Hussey is now considered the boss mine of the camp, and everything goes to show that such is the fact. Ever since the new Superintendent, John Yule, took charge there, things have changed remarkably. He has developed an extensive vein of ore on the 240-ft level, which is 12 feet wide, and all good free milling ore. The first-class will work from \$200 to \$300 per ton; second-class, from \$80 to \$125 per ton, and they have an immense amount of it in sight. Teams are now delivering daily at the Leopard mill six tons of the first-class ore and 12 tons of the second-class, all of which will be worked in a short time, when Cornucopia bullion shipments will come up to about the tune of its former days.

EUREKA DISTRICT.

MINING ITEMS.—Eureka *Sentinel*, Jan. 30 to Feb. 4: The Metamoras shaft will reach a depth of 400 feet by the 1st of March. Bullion shipped during the week, \$73,000. There is over half a million bushels of coal stored at the various furnaces. A difference of \$1.50 per ton is made by the railroad company in favor of refined lead over crude bullion. The ore body in the Mortimer mine is still looking well, and quite a quantity of high-grade ore is on the dumps. The Eureka tunnel will penetrate Prospect mountain at a depth of 900 feet below the apex of that elevation. A winze and connecting upraise on the 450-ft level of the Ham-hurg mine, has followed a fine vein of ore the entire distance. The Eureka Con. company shipped \$282,100 during the month of December. The Eureka Con. company received yesterday a large hoiler, which will be set up at the mine on Ruby hill. The K K company will commence shipping bullion next week; furnace is in full blast. The daily receipts of charcoal, by team and rail, will average over 10,000 bushels. A new shaft will be sunk at the Jackson mine next spring, and it will be located in the limestone east of the present hoisting works. At Sheriff's sale, the Orange Con. mine was sold to Patrick Moran for \$3,054.22. The shaft at the Grey Eagle mine is going down rapidly, sinking through favorable ledge matter. An analysis of the vein limestone on Ruby hill shows it to contain 53% carbonate of lime, 44% carbonate of magnesia, 2% carbonate of iron, 1% of silica and a trace of alumina. Notwithstanding the daily shipments, both crude bullion and refined lead accumulate in large quantities at the Richmond works. The new double crystallizer at the refinery will soon be in working order. After this week, the regular shipments of ore from the mines on Ruby hill, over the railroad, will amount to 400 tons per day, and it will take two regular trains to do the work. The Richmond company will receive five cars of coal daily after this week. Messrs. Arrington & Bartlett are working 16 men at the Geddes & Bertrand mine. The bullion production of Eureka district, for the month of January, was a trifle over \$800,000. A gentleman who is well posted prophesies that when the Eureka mining and tunnel company's tunnel penetrates the shale a large portion of the water that runs through the K K mine will be diverted into Goodwin canyon. The machinery to be used in working the 10th level and the ground below that point, in the Eureka Con. mine, is coming rapidly to hand. Furnace No. 4 at the Eureka Con. works, will be run down and relined as soon as the repairs to No. 3 are completed.

Arizona.

CONCENTRATION.—Arizona *Citizen*, Jan. 26: Mr. J. W. Haskins, of Globe City, called at our office, one day this week, on his way to San Francisco, where he goes to purchase some of the Frue concentrators, for working the ores of the Cadmus copper mine, in Globe district. Mr. Haskins gives it as his opinion that the

proper mode of working the greater part of the ores of Arizona for some years to come is by concentration. Mr. Haskins states that the Cadmus is not the richest mine in the world, but he does think it is the largest copper ledge yet discovered on the Pacific slope. The ore will average from \$90 to \$100 per ton. The ledge is well opened, the road and buildings are built, the machinery is there and now all that is lacking is the Frue concentrators.

MORE STAMPS.—*Arizona Enterprise*, Jan. 30: The Tip-top mining company think they will shortly have to add more stamps to their new 10-stamp mill; that is, if they do much custom work. Their several claims are yielding more rich ore than the company has ever dreamed of seeing in them.

YAVAPAI COUNTY.—Humboldt district is now the most attractive one in our county. It is not to exceed 50 miles south of Prescott, on the southern slope of the Bradshaw mountains. The district is pretty well watered and has abundance of timber. Latest accounts from the district are highly encouraging. The Tip-top, Foy, Cricket, Madden, Swilling and scores of other mines are yielding abundantly of ores that assay from \$100 to \$200,000 per ton.

BRADSHAW DISTRICT is still nearer to Prescott and higher up in the mountains. It has scores of fine ledges, some of which are now being worked.

TERREY, CREEK district is this side of the Bradshaw. In it is Masterson's mill, which is kept busy working ores.

EAST of it is the Peck district, of which little need now be said, since it is a well-known fact that it contains several of the best mines now known to miners.

HASSAYAMPA district, which is about 12 miles south of Prescott, contains some fine mines. So does Big Bug, Walnut Grove, Weaver, Black Hills, and other districts, while to the north are districts of inexhaustible resources.

BESIDES all these our county contains copper, coal and salt mines that are well looking after; so, take it all in all, it would be hard to find a better or richer region than Yavapai county, Arizona, once the home of villainous Indians, but now the resting place of over 20,000 white people.

MOHAVE COUNTY.—The miners of this county are giving good accounts. The population is rapidly increasing, and will continue to do so for many years to come. Three quartz mills are kept running, and another is in process of erection.

MARICOPA COUNTY.—This county, which borders Yavapai on the south, is more of an agricultural than a mining county, still her Cave Creek, Wickenburg and other mines are wonderfully rich in gold.

PIMA and **YUMA** counties have brilliant mining futures before them. Capitalists are now paying strict attention to their resources, and the miners of both counties are highly elated.

ALL our poor mine owners have to do is to keep right along developing their ledges, and otherwise preparing them for capitalists, who are every day coming, and preparing to come. As the *S. F. MINING PRESS* has well said, we must guard against luring capital by a false showing. But there is no necessity for this, since the great majority of Arizona mines are good enough for anybody.

Utah.

BIG COTTONWOOD.—Salt Lake *Tribune*, Jan. 27: The mines of the Columbus company, consisting of the Columbus, Oregon, Taylor and Abbey, yield very nice ore, which is being stacked up. The Little Giant yields some high grade ore. The Reed & Benson ships about 10 tons of 350-ounce ore daily. About 30 teams a day are employed hauling ore down the canyon. The Carbonate mine is the same big bonanza. Ore is being shipped daily. The Osceola, under the management of A. G. Paddock, looks well and is shipping. Mr. Greenway recorder of the district, is bappy and full of business. He looks for a rousing camp in the spring. Two hundred sacks of \$65 ore were shipped from the Maxfield the other day. They are just coming on the ore body.

LEEDS.—A mill is being put up to work Barbee and Walker ores. The Rock Cliff mill is worked on Stormont and Emily Jane ores. A rich strike is reported in the Pinkham & Dodge mine. Lively times are anticipated in Leeds this season of leaching and big strikes. The Dubuck mill has started up on Tecumseh, Maggie and California ores. The Leeds company's mines, worked by Mr. Williams, continue to turn out bullion as usual.

DRY CANYON.—Times begin to look bright for Dry Canyon. The Mono has been leased to Clark, Marshall & Boyle, and started up last Thursday. Ross Hutchins is working about 60 men in the Hidden Treasure; shipping as usual. W. H. Bowers has just completed a new outfit for the Desert mine, consisting of two rock drills (Wood's pattern), an air compressor, and a double cylinder hoisting engine. This is said to be the best hoisting works in the Territory.

ALTA.—The famous Flagstaff is shipping as usual. They are now raising from the Bay City tunnel to the Emma. Ore of a high grade is being taken out of the Alpha. Alta Consolidated is worked largely and doing well. The wire tramway runs regularly.

BINGHAM.—Dunican, Burkett & Gregg have converted the Revere concentrator into leaching works and are making money fast. The sixth shipment of leached silver from old Telegraph ores was made Friday, valued at 1,200 ounces each shipment. The Fagan & Bates

mill, running on Hampton gold ores, turned out a bar of gold, valued at \$3,600. This was the first shipment and created great interest. L. B. Kinney is about to put up leaching works and a stamp mill near the mine, below the depot. There are thousands of tons of leaching ore in sight at the Revere mine. The Mayflower, Giant, Yosemite and all the old-time mines are being worked. The Revere leaching works can run through 50 tons a day, and will soon be able to work 100 tons daily. Talbot & Winans are putting up small leaching works, opposite the Dixon mine. Its capacity will be an eight-ton tank.

A Bad Idea.

A Prohibitory Tariff on Printing Material.

We learned by telegraph from Washington on Friday last that one of the amendments to the new tariff bill now before the House, was to change the proposed 20% on type, which would be a reduction of 5% from the present tariff, to a specific duty of 13 cents per pound on news and book type, or really about 50% *ad valorem*, and 30 cents per pound on job and fancy type, or from 30% to 120% *ad valorem*, according to the size and style of the letter.

This is one of the most infamous jobs ever heard of in tariff legislation and bears upon its face the handiwork of the "Type Ring." This type ring is an association of some dozen type-founders, who meet together and arrange to how great an extent they will "cinch" the printers every year. There is no competition among them, for each has his own field. They send out no travelers, solicit no orders and keep their prices just low enough to exclude foreign makers. Now, however, having found that one foreign house on this coast was taking away the trade on this coast from one of the ring, who was formerly here (and which house has been capturing this trade, not by cutting prices, but by selling a good article), they are trying to get Congress to pass a prohibitory tariff bill. This is a direct onslaught on the printers of the Pacific States, and it is the duty of every printer to bestir himself and leave no stone unturned to beat the bill.

There is one thing certain—if this outrageous bill should be passed, it will cost the printers upon this coast thousands upon thousands of dollars; whereas, should it be beaten and the existing 25% be taken off, it would put thousands of dollars into their pockets. The bill is merely framed to prevent the Scotch foundry from continuing its business upon this coast, as it is the only foreign type foundry doing business in America. These gentlemen have spent large sums of money in establishing their business in this country and pay nearly \$20,000 into the public treasury every year, while their material is admitted to be the best in the world. It is not right or fair that these gentlemen should be obliged to give up business and that the hundreds of printers on this coast and elsewhere, who have purchased their material, should be debarred from the advantages they derive through trading with them, just because some ten or a dozen type-founders, rivals in business, do not approve of it.

The only way to defeat this bill is for every publisher to write to our representatives in Congress without delay and urge them to use their influence against that portion of the proposed tariff. Let them all print in their papers their opinion of the measure and the *Mail* will republish their united vote and see that it is thus brought to the personal attention of every Senator and Representative. This, together with the influence of the numerous Eastern papers that are urging the matter, will surely have the effect of defeating it, for we cannot imagine that any Congressman understanding it, would for one instant favor, far less give it his vote.—*Mail*.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's office at San Francisco:

STILES HERCULES ENGINE MANUFACTURING Co.—Feb. 5th. Capital stock, \$100,000. Directors—W. C. Stiles, J. M. Hixon, E. P. Marcellus, H. H. Pearson and J. L. Boone.

REDWOOD LUMBER ASSOCIATION.—Feb. 4. Capital stock, 150,000. Directors—H. F. Tibbott, John A. Hooper, Henry Wetherbee, J. B. Ford, John Dolheer, John Kentfield and J. G. Jackson.

ORIENTAL CON. G. & S. M. Co.—Location: Sierra county. Capital stock, \$2,500,000. Directors, H. H. Bissel, W. Mulroy, W. R. Mould, R. B. Mulroy and T. H. Smith.

ALTAR G. & S. M. Co.—Feb. 7th. Location: Mexico. Capital stock, \$10,000,000. Directors—F. V. Webster, F. K. Webster, W. B. Wilshire, J. G. Whitney and F. A. McGee.

INO PLUMBAGO M. & MFC. Co.—Feb. 4th. Capital stock, \$1,000,000. Directors—J. Hirschfeld, C. Westphal, G. Cane and J. M. Buffington.

PINAL M. & M. Co.—Feb. 4th. Location: Arizona. Capital stock, \$60,000. Directors—M. A. Baldwin, A. Roberts, E. W. Peet, L. T. Carr and C. E. Boyce.

Gov. IRWIN has ordered a special election for the 14th instant, to fill the vacancy in the State Senate caused by the death of Senator Angney, of Santa Clara county. Whoever may be elected will have (not excluding Sundays) about 47 days to serve.

News in Brief.

The steamer *Metropolis*, was wrecked on the 31st ult., and 150 lives lost.

They have been having severe storms in the Eastern States.

The public debt was decreased last month by \$1,668,076.

There were 300 arrests in New York on Sunday for violation of the Excise law.

The Chicago Academy of Music was burned on the 4th inst.

Austria and Serbia are not satisfied with the peace preliminaries.

The rebellion at Capetown is believed to be over, the insurgents having been defeated.

The German corvette *Elizabeth*, 18 guns, is expected here from Japan waters, en route for Central America.

An asylum for women and children at Tientsin has been burned, and over 2,000 persons perished in the fire.

The Legislative Committee to investigate the matter of the labor movement in this city has been in session during the week.

The steamer *Pelican* has been sold to parties in Central America, and will be turned into a gunboat.

The Central Branch Union Pacific railroad is now running regular trains to Conchordia, 155 miles west of Atchison.

Every preparation is being made to close the sound and approaches to Copenhagen with torpedoes, in 24 hours if necessary.

A number of coasting vessels are overdue at this port and a revenue cutter has gone in search of them.

O'LEARY completed his 400 mile walk in Cincinnati at 10:15 o'clock Saturday night, an hour and 45 minutes ahead of time.

NINE MILLIONS of people are reported destitute in Northern China. The Foreign Relief Committee appeals to England and America for aid.

TWENTY THOUSAND tons of lead were produced in Nevada last year, nearly one-third of the total production of the United States.

The suit of Hall vs. Truworthy, for infringement of patent on rubber type marking wheels, was decided in the United States District Court in favor of the plaintiff.

A SITE has been chosen for the Cleopatra obelisk on the Thames embankment, at the top of the Adelphi steps, between Charing Cross and Waterloo bridges.

The British war vessels *Albatross*, *Amethyst* and *Fantome*, of the Pacific, have been ordered home to be paid off and go out of commission.

In consequence of the armistice, the garrison at Widin has been ordered from Constantinople to surrender their arms, after which they will be quartered in neighboring villages.

CAPT. TINKLEPAUGH, long known to California travelers as a steamer commander between here and Aspinwall, died recently of pneumonia, aged 68 years.

ALL the wheat vessels which cleared from this port in July and August last have arrived out, except one. Three of the September vessels have arrived out. There are only 59 cargoes afloat.

The passenger arrivals by sea from foreign ports at San Francisco last month numbered 1,022, and the departures 689. The movement was unusually light both ways. There were 600 from China and Japan, against 288 departures to those countries.

FORTY THOUSAND bids have been received for carrying mails during the next four years in nearly all that portion of the United States lying west of the Mississippi river, and extending to the Pacific ocean. Awards will be made by March 30th.

EIGHT cargoes of wheat, aggregating 297,700 centals, and valued at \$699,800, were cleared from this port last month. Since July last we have cleared 72 wheat vessels, carrying 2,746,700 centals, valued at \$6,441,800. During the corresponding period in the previous season we exported 255 cargoes of wheat and flour.

The Secretary of the Treasury will not open the Mint at Philadelphia for the coinage of trade dollars, and will place such restrictions on Western Mints as will prevent their coinage for shipment East. Coinage of sufficient amount to meet the actual demand for export will be authorized for the present, or until Congress shall have acted upon the coinage of the silver dollar for circulation.

EIGHT hundred of the Red Cloud Indians have left the agency, going north. The Indians assert that all the fighting bucks at that agency will cut loose early in the spring and follow the general northward trail. Spotted Tail Indians are secretly buying fat ponies, and making other suspicious moves.

The bill agreed upon by the House Committee on Pacific railroads for the benefit of the Northern Pacific railroad extends the time of its completion ten years and reduces the land grants in Washington Territory, taking away such portion of the land as was before embraced in the appropriation for the construction of the road from Pen d'Oreille to Puget sound.

A BILL has been introduced in Congress providing for the incorporation of a company to build a railroad from Cheyenne, thence to Fort Laramie, where the road divides, one fork going to Deadwood, and one to Fort Fetterman, thence to the Yellowstone river at the mouth of the Big Horn, and thence by Helena to the Pacific ocean, with such other branches as may be deemed necessary. No land grant is given but the usual right of way and land for engine-shops, etc.

AN official investigation of the loss of the *Metropolis* has been ordered.

POPE PIUS IX died at the Vatican, Rome, on Thursday afternoon.

THERE have been some fatal snow slides in Utah within the past week.

GEORGE CRICKSHANK, the well-known draughtsman and caricaturist, is dead—aged 84.

J. R. DODGE, Statistician of the Department of Agriculture, will probably retire from that position.

The House Committee on Education and Labor is considering the various measures proposed to restrict Chinese immigration.

The Library Committee of the Senate and House have agreed to ask the appointment of a Commissioner to consider the matter of building an extension to the Congressional Library.

The deaths recorded at the Health Office last week numbered 94, against 101 the preceeding seven days. The average of the corresponding weeks for five years past is 95.

ALL of the old and long established physicians in this city have fallen into the good practice of giving medical attendance to the poor free of charge, devoting a large portion of the day to this work of charity.

The St. Petersburg *Vedomosti* calculates that after the conclusion of peace the Black sea and Sea of Azof ports will export 5,000,000 quarters of wheat.

The great storm in the East nearly devastated Coney island, in New York harbor. There was great destruction of property at Long Branch, and along the coast elsewhere.

The Union Mutual Insurance Company, one of the oldest marine companies in New York city, announces its intention to retire from business. Cause, too large reductions of premiums and shrinkage.

FOLLOWING is a statement of coinage executed at the United States Mints in January, 1878: Value of gold coinage, \$7,446,000; trade dollars, \$1,391,300; fractional silver, \$907,810; minor, \$11,336.

THE Assembly has adopted a concurrent resolution calling on the Joint Committee on the Constitutional Convention to report on or before the 15th instant a bill calling for a Constitutional Convention.

GEN. SUTTER, the discoverer of gold in California, is in Washington, and has been granted a hearing by the House Committee in favor of his claim of \$50,000, that has been so long pending in Congress.

THE roof of a large building known as the furnace house of the New England Glass Manufacturing Company, East Cambridge, fell in on the 3d instant, with a terrific crash. The roof was of iron, 100 feet long, by 90 feet wide, and was constructed in 1861, at a cost of \$18,000. There was no snow on the roof, and the cause of its fall is attributed to contraction of the metal by cold.

COL. PURDY, son of ex-Gov. Purdy, of California, has just been promoted by the Khedive of Egypt from the grade of Bey to that of Pasha. During the late war Col. Purdy was Assistant Adjutant-General upon Gen. Franklin's staff. He accompanied Gen. Stone to Egypt, but recently returned to Cairo after an absence of 18 months, in command of an expedition for scientific purposes.

THE Hinkley Locomotive Works, of Philadelphia, have suspended. Liabilities, about \$300,000; half of the paper held by Boston banks. The property of the company is assessed for \$350,000. Fifty thousand dollars is required to tide over existing trouble, and a committee of creditors has been appointed to consider what course to pursue.

GLoucester fishery vessels bring intelligence of the almost total failure of the fishery, owing to the determined hostility of the New Foundland fishermen. The action of the New Foundlanders will result in large pecuniary loss to Gloucester, and steps have been taken for laying the matter before the Government at Washington.

GEN. MILES, under date of 25th ult., reports, from Tongue river, that the main body of his command has taken the field, and he only waits for 150 recruits from Fort Snelling before proceeding in person against Sitting Bull, who, he confidently believes, is in United States territory. His force will operate from Fort Peck as a central point.

The State Department has been requested by Samoan representatives in Washington to send a war vessel to the Island of Samoa, and Evans has referred the matter to the Navy Department. The *Tuscarora*, which is in San Francisco for repairs, has been detained by orders, and will probably be sent out to the islands. The treaty of friendship and amity ratified by the Senate last week causes the request.

RAILROAD SALE.—The largest and most profitable railroad in the world—the East India, from Calcutta to Juhulpore and Delhi—will be sold early in 1879, and the Indian office is already provided for it. The first 25 years of its existence have expired, when under the conditions of its incorporation, the Secretary of State has the option of taking it at cost price. The capital is £30,500,000, and the annual dividend has reached nearly 7%, while the working expenses are lower than on any other line. As the government guarantees 5% on the capital, and advanced not a little in the earlier years of the railway's history, the account is somewhat complicated, and the interest involved, alike to the country and the shareholders, are of some magnitude.

THE ENGINEER.

Mr. Eads' Success.

The Secretary of War received, January 8th, the report of Col. G. Barnard and Lieut.-Col. H. G. Wright, of the Corps of Engineers, designated by him as a board to proceed to Port Eads, Louisiana, and make a personal and thorough examination of the work now in progress under the direction of Capt. Eads, for the improvement of the south pass of the Mississippi. The report sets forth that there has been secured through the south pass of the Mississippi river to deep water in the Gulf of Mexico, a depth of 22 feet of water in a channel not less than 200 feet in width, which entitles Captain Eads to the second installment under the act of Congress. The Secretary, in speaking of the appointment of this board, said that it was simply intended to verify the reports of Capt. Brown, and at the same time to solve some doubts he entertained as to the precise methods by which these results have been obtained; whether the action of the jetties and auxiliary works and the forces of nature thus brought to bear, or by the use of a dredge. The report of the board removed all doubts on this point, as it was shown that the operations of the dredge were essential to the success of the work only in its incipient stages. The Secretary now awaits the arrival of Capt. Eads, and as soon as he presents his claim in due form, a requisition on the Treasury for \$500,000, the second installment, will be issued to him.

MONCRIEFF SYSTEM OF MOUNTING ARTILLERY.

In the improvement of his system, Col. Moncrieff has had recourse to the assistance afforded by water and compressed air. This application, says *Iron*, has been worked out and embodied in a hydro-pneumatic gun carriage, which has recently been successfully tried at the engineering works of Messrs. Eastons & Anderson, the manufacturers of the carriage, at Erith. In order to test the principle, a carriage of this pattern was ordered by the government. The advantage of having some such carriage was long since pointed out by the committee on high-angle firing. Subsequently, and as one result of the Eastbourne experiments, the committee on siege-gun carriages recommended the introduction of a carriage possessing such attributes. Hence the present action of the war department, which has lent a 64-pounder gun for the purpose of testing the new principle. They have also supplied the ammunition for the experiments, the charge being 12 pounds of powder and a 64-pound shell. The gun is supported in firing position on levers, supplemented by a ram working in a cylinder which is in communication with a vessel, the upper part of which is filled with compressed air, the lower portion containing water. The air has an initial pressure given it sufficient to raise the gun. When the gun is fired the energy of the recoil drives the ram down into the cylinder, forcing the water up into the air vessel, thus further compressing the air. A self-acting valve prevents the water from returning after the recoil has been completed. When the gun has been loaded behind the protecting parapet, a valve is opened, and the water allowed to flow into the cylinder. The air-pressure is thus brought to act on the ram, which at once raises the gun into firing position. The present carriage is experimental.

THE CONTINENTAL OIL BELT.—A correspondent of the *Parker Daily*, who has been traveling through the Kentucky region, writes that the Great Southern Oil Works, at Louisville, have been turning out daily about 400 barrels of refined oil, and in connection with other refineries at Glasgow and Barkville, Ky., and Brownsville, Tenn., supplies most of the Southern markets. The correspondent says the Kentucky fields are now yielding quite sufficient for the Southern trade. Those regions, he adds, are now attracting much attention, and are regarded as second only in importance to those of Pennsylvania. He represents that near McMinnville, in Warren county, oil is incessantly thrown out in small quantities, and the roar of escaping gas can be heard for a great distance. Also notes the fact that in 1865 a well put down on Crocus creek yielded 1,000 barrels a day while flowing, and remained a 200 barrel pumper for a long time. The belt is said to be traced through the western corners of Kentucky and Tennessee into the Ozark mountains of Arkansas, where petroleum was found many years ago, thence passing through a corner of Indian Territory and Texas, and on, presumably, through New Mexico and Arizona to southern California.

NEW STYLE OF RAILWAY TIES.—The *Railway Age*, says that cast iron ties with wooden blocks fitting into sockets under the rails to give the needed elasticity, are being tried on the Cincinnati, Hamilton & Dayton railroad. It is claimed by the inventor that they are more economical, safer, enable the track to be kept more easily in repair and make it more solid than the wooden tie. There is room for improvement in the present expensive method of supporting rails, and it will become more urgent as the timber supply of the country diminishes, unless indeed the work of planting timber specially for ties, so strongly urged in this paper from time to time, shall be largely undertaken. The result of the various experiments with iron ties now going on in this and other countries will be awaited with interest.

CENTRAL ASIAN RAILWAY.—It is said that the great Russian project of the Central Asian railway is to be consummated. The road commences at Moscow, and is already fully completed to Samara, on the Volga, through Lower Novgorod, a distance of some 600 miles. Running southeastwardly from Novgorod, through Samara, it reaches Orenburg, on the Ural river, 600 miles, then follows a curve of that river due east to Orsk, which is 150 miles east from Orenburg, 300 south from Ekaterinburg, and 600 from the Caspian by the winding of the Ural. This is the termination of the European and the beginning of the Central Asiatic road, about which vast enterprise so much has been said for so long a time past. From Orsk, the line is southeastward to Tashkent, in Kokhan, about 800 miles—through swamps and deserts, over mountains and rivers, which require enormous bridging, tunnelling, piling and excavating, and thence eventually into Cashgar, where an intersection is made with the contemplated road from Ormus, in the Gulf of Persia, which, crossing Afghanistan into Cashgar, is aimed toward Peking. The route runs a little north of that originally devised in Eastern Europe, and east of that formerly outlined in Western Asia, and is justly spoken of as one of the greatest material enterprises yet undertaken by man.

A CHEERING PICTURE.—The *North American*, says: "That all the insurance and banking

LONDON SIDEWALKS.—The city of London claims to possess the most scientifically constructed sidewalks in the world. The method pursued is, first, to carefully grade the ground, sometimes using concrete to secure a firm foundation where the soil is too soft, but generally sand spread over the leveled ground is sufficient. The curbing is made of roughly "pencil-hammered" gray granite, 12 inches wide on the top and six inches high. Besides this run the gutters draining the roadway. The flagging is generally from three to four and a half inch in thickness. The edges are chiseled, not elaborately, but so that when the flagging begins to wear away, under the continuous traffic the joint will remain good until it is threadbare, if ever it is allowed to remain long enough to get into that condition. A liberal allowance of mortar is thrown down on the sand in which to bed the stones; the latter are placed together closely, the joints being not more than a quarter of an inch apart and well filled with binding and hardening cement. The surface of the flags are machine-dressed or rubbed, so that they always meet evenly at the joints. The rough stones are brought to the streets that are to be paved and are stacked in piles, from which the pavers take them, preparing the edges with wonderful rapidity. The stones are broken quickly, neatly and with little waste of material. A line is drawn on the face where a break is required; this is "strummed" in with a pitch-

California Fan Palm.

The California fan palm (*Prichardia filifera*; *Bahea filamentosa*) is a native of California and is found along the Colorado river and in some places in the desert in San Diego county. Several Eastern and foreign periodicals and horticultural papers have given illustrations of this palm, but none of them came anywhere near its natural structure. The cut we give above is taken from a photograph from a plant only three years old, grown by John Rock, the well-known nurseryman of San Jose. The seed was sown on the 15th of February, 1875, and the plant stands now three feet ten inches high. The objection to palms has always been their slow growth; taking a long time to make a showy plant. Often people have planted the Australian cabbage palm (*Corypha Australis*), the most common one found in nurseries, and after a few years nursing they have thrown them out because they would not make any headway in growth. About 20 years ago a lot of seed of this palm was brought to San Jose and Louis Grevest, the pioneer nurseryman, cultivated them and raised about 50 plants. These were distributed over the State, most of them having grown into specimens of 20 and 30 feet of height.

Gov. Latham, of this city, bought two in San Jose, which stood, at the time of purchase, about 25 feet in height, for the handsome sum of \$1,000. These he moved to Menlo Park, a distance of 18 miles. Many doubted their ever growing, but they have done finely. They stand now 30 feet in height and are 2½ feet in diameter, crowned with a head of fan leaves. They stand in front of a magnificent residence, on an open lawn, and present a most beautiful aspect.

Mr. Grant I. Taggart, of Oakland, informs us that two of this species of palm are growing at Shasta on the premises of W. E. Hopping, County Judge of Shasta county. They were planted some 20 years ago, they have immense trunks from three to four feet in diameter. This must be about as far north as palms were ever cultivated in the open ground. At Shasta the ground is often covered with two feet of snow. This is another proof of the hardiness of this palm.

The California fan palm is most distinct of all palms, having fine thread hanging down from its leaves. It will be very valuable as an ornamental plant in all subtropical climates, being the fastest grower and hardiest of all palms. Not until the last three years has its native place been known, but upon the completion of the S. P. R. R., they were found along its line, and even whole carloads of large plants were brought to San Francisco and sold. They may be now had almost at any nursery at a reasonable figure.

The New Regent.

Governor Irwin has appointed Mr. John L. Beard, of Alameda county, a member of the Board of Regents of the State University. The appointment is one fit to be made and in which our readers will feel much interest. Mr. Beard is a practical farmer, in the full vigor of early manhood, well educated, both in the schools of learning and of practical experience and observation. He is a believer in progressive ideas, but not radical nor visionary. His accession to the Board of Regents will lead to the representation in that body of several elements which have hitherto been unrepresented. One of these comprises the graduates of the institution and its progenitor the old College of California. It was chiefly in respect to the desires of this class for representation that Mr. Beard was selected. As a representative also of the agricultural interest of the State, Mr. Beard will find opportunity for earnest and devoted effort, and we are confident that he has both will and quality to make it.

John L. Beard is a son of E. L. Beard, Esq., of Mission San Jose, one of the pioneer agriculturists of the State. He was born in Indiana in 1845 and came to Alameda county in 1850. He graduated at the College of California in 1868 and began the management of his farm before he finished his college studies. The better part of two years after graduation he passed in travel in the Eastern States and in Europe, and made good use of his opportunities for observation. In 1870 he settled down to the pursuit of agriculture and is now farming about 700 acres in two farms, one near Centerville and the other near Harrisburg, in Alameda county. He has been successful in his farming operations and has taken a leading part in irrigation and other enterprises for the good of his own interests and those of his neighborhood. He has the confidence and good will of the many who know him throughout the State, and will take pride in such counsels and actions as shall truly advance the interests and usefulness of the University. We wish him all success in this work.

BOOKS PUBLISHED IN 1877 IN ENGLAND.—It appears that of 3,049 publications and 2,046 new editions, the books on political and social economy, trade and commerce, were 123 new works and 66 new editions. Books on art, science and illustrated works numbered 125 new publications and 64 new editions.

THE CALIFORNIA FAN PALM—*Prichardia Filifera*.

institutions of Philadelphia, have been untouched and are sound if not lucrative; that with the great depression in railway property everywhere, nearly all of that in this State has appreciated in value; that despite the unprecedented dullness of the coal trade, we have mined more than ever before; that our iron interests have really lost but little; that more tonnage is being built on the Delaware than ever; that the over-production of oil alone has interfered with its profits; that the wholesale trade of this city has steadily augmented; that our foreign trade is growing by new routes and the better patronage of old, and that in this city almost a thousand new building permits were issued last year after the unprecedented construction to meet the Centennial; while the various factories and mills, reducing their expenses bold their course in anticipation of the dawn that never fails strength, wisdom and courage.

THE SAHARA PROJECT AGAIN.—The project of converting a part of the great desert of Africa into a highway for commerce by reopening a channel which once connected it with the Atlantic ocean, is still being advocated in England. The great plain or hollow in the desert is said to be about 500 miles long and about 120 miles wide, with a depression of some 200 feet below the sea level. By letting in the sea, vessels would be able to penetrate into the heart of Africa, whose rich and varied products would thus be brought within easy reach of the civilized world.

ing tool or nicker, the edges being also strummed in; then the stone is smartly struck on the back with a round face hammer, three blows generally breaking it neatly down the line. Almost any kind of thin stone can, it is stated, be broken in this way without the use of either wedges or plugs.

A NEW OVERLAND PROJECT.—A Washington dispatch, dated January 2d, says: A new Pacific railroad bill will be presented as soon as Congress reassembles. The eastern terminus is to be at Memphis, thereby forming connections with present railroad facilities to all points north, east and south. Westerly the proposed railroad will pass Lake City to Jefferson, Texas, thence by the International and Great Northern Railroad to San Antonio, thence in a northwesterly direction to El Paso del Norte, to connect with any road or roads to the Pacific ocean now or hereafter to be built, thus affording communication with the various military posts on those lines and the valley of the Rio Grande. The projectors of the road ask for \$13,000,000 in all, to be refunded to the Government as rapidly as the money may be earned by the transportation of mails and Government supplies. One of the arguments used by the friends of the railroad is that it will be an important means of removing troops to suppress disturbances on the Rio Grande and elsewhere.

KEELY's motor cost the investors \$200,000, and Keely nothing.

Mining Safeties.

All sorts of devices in the way of safety arrangements have from time to time been suggested or brought into practical application, to obviate as far as possible the frightful and costly accidents occurring and liable to occur in the working of our mines. Some of these devices have on trial been found to possess practical merit, consequently were adopted, while others have been quietly dropped as impracticable. One of the commonest of fatal accidents in times past has been that of a carman inadvertently running his car into the shaft and immediately following it in its swift downward career to destruction in the depths. Effectual devices and precautions have been by degrees adopted, until now that style of accident is heard of no more. A dog falling accidentally down a shaft suggested the idea of a grating which would be carried upward by the ascending cage and replaced in its descent, leaving the shaft always protected, either by the cage or the grating, unless both cage and grating were carried upward "into the sheaves."

Various devices have been suggested and tried for automatically disconnecting the cable at such a critical time, when this regular and well-tried safety attachments in general use would immediately prevent any drop of the cage. Among the first was that of the pilot-driver, the elevating clamps of which are opened and disconnected, like pincers, as it were, by the upper portion or handles, so to speak, striking against the top of the hoisting frame. The latest device brought under our observation is that of Mr. C. W. Laue, of Gold Hill, which was simply a projecting arm or cam which would catch against a beam at the top of the hoisting frame, instantly disconnecting the link of the cable. The cage was left for the regular and unfailing safety attachments to take care of, while the flying end of the cable should go after the culpable engineer. It has been practically tried and found to work well, but the principal objection consists in its liability to be disconnected by anything falling, or accidental collision with some unlooked for object. Doubling or quadrupling this or the pilot-driver arrangement, however, would make them far more secure, if not entirely safe. Another device at one time employed at the Imperial-Empire shaft was that of "chairs," placed in the side guides, below the sheaves, which would catch and hold the cage when hoisted too high. This was well enough if the cable did not pull the cage overboard or to pieces.

Right here we wish to offer a little suggestion of our own. In place of the "chairs" just mentioned let there be a movable platform, fast at the sides, but opening in the middle, like folding doors, with a hole between, in the middle, for the cable to run through. This folding platform should be made of greater width than the bottom of the cage, rendering a direct drop down the shaft impossible, even were the cage pulled to pieces. Moreover, the cable connection might be so arranged as to be square and promptly parted in passing over the sheave, as a stick is broken across one's knee. We respectfully submit the foregoing idea to Col. Fair, the acknowledged old chief Superintendent of the Comstock, who always has an eye to the practical and effective in such things, and also to Superintendent Frank Thayer, of the Julia, whose mechanical genius and experience is well known and established. Here now is a fine opportunity for some good practical mechanical head to distinguish itself in obviating the terrors and dangers of "Brown's station."—*Gold Hill News.*

Mining Industry in Oregon.

From the signs of the times it is quite apparent that the quartz mines of Oregon will be brought to the front, and that the gold and silver products will create a reputation for the State as the wheat, wool and salmon products have already done. Many of our leading citizens are now interesting themselves in the development of mines. The capital and labor expended the past year on the silver mines of Grant county have established their richness and extent beyond a question of doubt and stimulated public attention to that extent that before another year a busy mining camp, with mills, machinery and the appliances for the reduction of ores, will be at work, and gold and silver bars will be regularly received at Portland. Much has been said and written in regard to the evils of stock speculations, and, doubtless with good reason; yet there is a wide discrimination between the investment of money in developing the wealth of a mine or simply speculating upon the manipulation of mining stocks. The investment of means for the opening of a mine which prospects well is more of the character of investment in real estate in a growing city.—*Oregon Sentinel.*

THE SULPHUR MINES.—Alex. Wise, just in from the Rabbit Hole sulphur mine, informs us that the California & Nevada Sulphur Company are carrying on work systematically at the mines under the Superintendency of C. S. Oehorn, and making the business pay handsomely. Mr. Wise's teams are engaged in hauling sulphur from the mines to Humboldt house, from which point it is shipped to market by rail. He delivers 20 tons every five days regularly at the railroad. The California & Nevada Sulphur Company is a new corporation, which has bought out one or more of the mines and are working them in a business like manner.—*Silver State.*

USEFUL INFORMATION.

How Varnish is Made.

In the manufacture of oil varnish, says the *Polytechnic*, the most lustrous and durable of their kind, a resin, oil and spirits of turpentine are employed. The gums are carefully assorted in the factory into sorts of greater or inferior purity and clearness; and the oil and turpentine are taken generally from large settling tanks in which they have been kept undisturbed for some weeks to free them from all impurities and to improve their qualities. The procedure of their manufacture may be described as follows: The carefully selected gum is first fused over a slow fire, with constant stirring to prevent its adhesion to the sides and bottom of the melting pot, and consequent scorching. When properly melted the necessary quantity of oil is added to it. This quantity is estimated largely by experience, but can be determined to a nicety by transferring from time to time a drop of the mixture upon a glass plate, on which it is allowed to cool, and testing its ability to be penetrated by the nail without cracking; when this condition has been reached the quantity of oil added is sufficient. The mixture is then gradually heated and thoroughly mixed. This completed, it is removed from the fire, allowed to cool somewhat, and the turpentine added under constant stirring to the still hot and liquid mixture. It is important that this last operation shall be conducted at the right temperature, for if the mixture is too hot, too much of the turpentine will be lost by evaporation; while if too cool, it will be too viscous or sticky to permit of the proper incorporation of the turpentine. When the incorporation of the turpentine is effected the varnish is practically made, the succeeding operations being filtration, which is done while the mixture is still hot, and the clarification or ripening, which is effected in large settling tanks, from which, after the proper time has elapsed, it is drawn off into the vessels in which it finds its way to the market. In these several operations, the greatest precaution must be taken to avoid the accident of the ingredients taking fire, an occurrence that might be attended with serious consequences.

PAINTING THE HOURS ON METAL DIALS.—A Swiss watchmaker's journal says the principal ingredient is soot, which is obtained by holding a clean copper or sheet metal plate over the flame of an oil or petroleum lamp (a glowing tool serves the purpose very well). As soon as a sufficient deposit is produced it is collected on a piece of glass, care being taken not to mix any foreign substance with it. A few drops of essence of lavender are then poured on the soot and the mixture pounded with a spatula. This done, just sufficient copal varnish is added to give the composition a proper thickness, so as to prevent its spreading when applied. The varnish thus prepared is put on by means of a very fine brush. To secure brilliancy the dial is dried at a slow heat, by passing it lightly over a spirit flame, the reverse side of the dial being, of course, the only part exposed to the flame. This composition must be made in quantities large enough for present use only, as it dries very rapidly and cannot be utilized afterwards. To secure good results this process requires some experience, which can only be obtained by careful experiments. The painting especially requires a certain aptitude and lightness of hand, which may, however, soon be attained by strict attention.

FOREIGN SUBSTANCES IN RAW SUGAR.—In the course of an interesting lecture "On the Impurities in Raw Sugar," lately delivered at Greenock, England, Mr. Neill, a sugar refiner of that place, displayed a number of "foreign" impurities imported in sugar, such as a crowbar, brickbats, stones, a piece of volcanic mud, an old stirrup, a Chinese head-dress, and other articles of dress worn by the workers on the plantations and at the shipping ports, and which found their way into the hogsheads and bags through carelessness, and sometimes to make up weight for sugar that had been stolen. Mr. Neill said he knew a Greenock refiner obtain no less than three tons of stones out of one cargo of sugar. One of the chief impurities in sugar was sand, and in Mauritius sugar there was found 1½% of that substance.

PAY YOUR DEBTS.—Clean hands in matters of money among the young certainly ought to be the indispensable condition of gentlemanliness. No man who borrows and does not pay, and does not care whether he pays or not, is a gentleman, no matter how witty, or gay, or fine he may be. To speak in good plain English, the man who dresses himself at another's expense, not knowing how to pay, not caring whether he pays, is a genteel scoundrel! And yet such things are done by good-natured folks, by kind-hearted people, by persons who never probe them morally to ascertain what their tendency is, and what they lead to.

LOOSE STOPPERS.—To prevent tincture stoppers from becoming gummed into the neck of the bottle, Mr. Hans M. Wilder recommends a slight coating of paraffine to the stoppers and in the neck of the bottle. This can be best accomplished by rubbing the stoppers with a piece of paraffine and giving them a turn in the neck of the bottle, so as to distribute a thin coating all over.

Making Soap in Closed Boilers.

A writer in the *Polytechnic Review* calls attention to an improvement in soap making devised by Mr. E. H. Gibbs, which consists essentially in introducing the ingredients into a strong closed vessel or boiler, and subjecting them therein to the effects of a high temperature and pressure, the intermixtures of the ingredients being secured by mechanical agitation. In this manner, and with a very simple apparatus, the process of saponification is effected with great rapidity and economy, and it is claimed, with far more thoroughness, and, as the glycerine remains incorporated with the product, without this waste, that attends ordinary operation with this open kettle.

The apparatus employed in this process consists of a cylindrical steam boiler, through the center of which passes a shaft provided with wings or other suitable devices. This shaft set in motion either by hand or by power, according to the size of the boiler, serves to keep the charge in constant agitation during the operation of saponification, and thus to insure the complete intermixture and contact of the ingredients.

The boiler is charged through a hopper with the ingredients, grease, tallow, or oil, alkali, resin, etc., in the usual proportions, and the boiler being fired, the charge is subjected, under constant agitation, to a pressure of from 120 to 150 pounds per square inch, which is found to effect the complete decomposition of the fatty matter and its saponification in the space of six hours. With a boiler 30 inches in diameter and 11 feet long, it is affirmed that 2,000 pounds of soap can be made and put in the frames in three hours, so that where four runs per day are made from one of these boilers, which we are informed can be done in case of necessity, (three runs daily being the average), the apparatus will make as much soap as 24 boilers of the same size would by the ordinary process with the open kettle.

CALCULATION RELATIVE TO WATCHES.—The balance of a watch beats five vibrations per second, 300 per minute, 18,000 per hour, 432,000 per day, 157,776,700 per year (365 days, 5 hours, 49 minutes). If a watch should go for a century, as sometimes is the case, its balance would execute 15,778,470,000 vibrations. To give an idea of the magnitude of this number, a thousand million minutes have not elapsed since the commencement of the Christian era. How many individuals carry their watches three, four, five years and more without ever having them cleaned. If we take, say five years, the watch will have produced 788,923,000 vibrations, and people expect their watches, after this enormous work, to correctly indicate the hour, minute and second. If watch-wearers reflected a little they might be somewhat less exacting towards the watchmakers.

TIMBER LANDS.—The House Committee on Public Lands last week, heard all the Territorial delegates in advocacy of their various bills for the sale of timber lands. The Commissioner of the General Land Office was also present, at the instance of the Committee, and explained and advocated the recommendations on this subject contained in his last annual report. The prospects are that the Committee will report for passage a general measure, in accordance with Commissioner Williamson's recommendations, the main features of which are embodied in the bill introduced by Pacheco, now before them.

GOOD HEALTH.

The Physician.

The following is a translation of an epigram written by Cordus in the sixteenth century:

The physician like an angel seems,
When he in the sick-room brightly beams;
And like unto a god is he,
When he's removed the malady.
But in a different light we view
The Doctor when his bill is due;
Our altered eyes we at him level,
As though he were the very devil.

HEAT OF THE BRAIN.—M. Broca has recently laid before the French Medical Association some curious facts concerning the temperature of different parts of the skull. By numerous experiments he has found that while at rest the temperature of the surface of the head is 2° Fahr. higher on the left side than on the right. When the brain is active, equilibrium is established. When continuous but moderate mental effort has been maintained for ten minutes the temperature is raised about 1° Fahr. The temperatures of the frontal, temporal, and occipital regions of the skull are also different, that of the frontal region being more than 4° Fahr. higher than that of the occipital.

MORPHINISM.—This name, says the *Druggists' Advertiser*, is given to a new form of vice, which seems to be increasing. The vicious indulgence consists in the hypodermic administration of morphia for the sake of the stimulating effects produced. The evil results are numerous and distressing, but they are almost entirely removed for the time by the administration of a new dose of the drug. The habit or desire grows by indulgence and at last leaves the patient in a state but little better than insanity.

THE INFLUENCE OF FORESTS ON THE ATMOSPHERE.—M. Faurat has communicated to the Paris Academy of Sciences the results of his thermometric observations during the past year on the influence of forests on this climate, and their general tenor, as detailed below, appears to bear out his earlier studies in 1876 and 1875. The London *Farmer* gives the following summary of his conclusions: During the progress of vegetation in June, July and August, a tree in full leaf, imbuing its nourishment from the atmosphere, produces a movement which is reflected in the air by a slight decrease of temperature. During the daytime a rise of temperature can always be noticed above fir trees, owing to this solar heat retained by the vapors which surround the tops of the trees. It is to this moist and warm medium that the vigorous vegetation of resinous trees in poor soils must be ascribed. From concurrent thermometric observations made in forests and away from them, at 1.40 and at 14 meters above the ground level, M. Faurat arrives at the following conclusions: In consequence of the differences of temperature which are observed underneath the foliage and above the summits of trees, a current of air from below upwards is established in forests, and also lateral currents around woods from the foliage towards the open space beyond. These currents cause a healthy breeze in hot weather. The ascending current carries off above the forests the vapors from the soil, puts this latter in communication with the clouds, and fills the office of a lightning conductor; and it is to this, no doubt, that forests owe their remarkable property of keeping hailstorms at a distance.

OUR DIGESTIONS.—When proper, natural, simple food is taken into the healthy stomach, no more is felt of it. If it be of the nature of soup or beef tea, it is absorbed, as it were, by the coats and veins of the stomach. If it be meat, it is, by the movement of the stomach, carried round and round its cavity and mixed up with the gastric juice, which oozes into the stomach whenever food is put into it. This gastric juice is a clear, colorless, acid fluid, which flows freely into the stomach, as we have said, whenever food is taken into it. The free acid present in the gastric juice (of the dog) is lactic acid. The gastric juice has a very slight tendency to putrefaction and may be kept for an indefinite length of time in a common glass bottle without developing any putrescent odor. The peculiar property of this fluid is that it dissolves meat, boiled white of egg and such like substances. It does so even outside the body, but it does so best inside the body, assisted by the high temperature of the stomach and by its peculiar movements. Gastric juice does not dissolve all kinds of food. It does not dissolve fat, nor starch, nor oil. Its proper duty is to dissolve meat, gluten (the most nutritious part of bread), caseine (the most nutritious part of milk), albumen (white of egg), etc.—*Canada Globe.*

SOUND SLEEP.—*Hall's Journal* says: Any man who can bound out of bed as soon as he wakes of a mid-winter's morning is worth something; no fear of his not making his way through the world creditably, because he has the elements of a promptitude, decision and energy, which guarantee success. To invalids we make a comfortable suggestion worth knowing. If you have force of will enough to keep you from taking a second nap—and it is the "second nap" which makes its baneful influence felt on multitudes—it is better for you to lie awhile and think about it, until that feeling of weariness passes out of the limbs which you so commonly feel. But to sleep soundly, and to feel rested and refreshed when you wake up of a morning, four things are essential:—1. Go to bed with feet thoroughly dry and warm. 2. Take nothing for supper but some cold bread and butter and a single cup of weak warm tea of any kind. 3. Avoid over fatigue of body. 4. For the hour preceding bedtime, dismiss every egotistical subject from the mind, and let it be employed about something soothing and enlivening in cheerful thankfulness.

CARROT OINTMENT.—It is convenient, if not absolutely necessary, says a writer in the *Rural New Yorker*, to have on hand a sure remedy for burns, flesh-wounds, chapped hands, etc. The demand is supplied in many families by patent remedies, in ours by carrot ointment made as follows: To one medium-sized carrot, well washed and thinly sliced, allow one-fourth pound of freshly churned, unsalted butter. Place them together in a spider or other iron vessel, simmer slowly until the carrot is crisp and brown—taking care not to burn it, then strain through a thin cloth and keep in a tin box or wide-mouthed bottle. As a healer it has few equals. A few applications will cure the worst cases of chapped or cracked hands, provided the hands are well washed with castile soap and soft water, and well dried, just previous to its application. After applying the ointment rub the hands, warming and rubbing them until all is absorbed. It will speedily heal burns after the fire is extracted. Indeed, we use it in all cases where a healing agent is needed.

OVER-EATING.—As soon as you are sensible that you have eaten too much, take a walk, gradually increasing its rapidity until there is a free perspiration, and continue at this gait until every feeling of discomfort about the stomach and lungs has disappeared, then cool off very slowly in a closed room, and eat not an atom until the second meal thereafter, thus omitting one.

The Week.

The week has been another rainy one and the streams are nearly all running pretty full. We notice, however, that in some parts of the State although a large amount of rain has fallen, the supply of water in the ditches is limited. Up on the Forest Hill Divide, for instance, the ditches are not more than one-fourth full. The Dutch Flat *Forum* says that at that place and Gold Run the ditches are by no means running to their full capacity. The deposits made by the late storms (from where the ditches take their supplies), although extensive, consisted principally of snow; the fall of rain being so limited that the ditches are not taxed to half their capacity in running water. An important event of the week is the flood in the neighborhood of Sacramento, noticed more fully elsewhere. A large extent of country in that vicinity is under water, and great damage has been done to the agriculturists. Another matter of importance to the mining community this week is the testimony elicited before the Assembly Committee on the debris question. We publish the testimony in this issue. It is worthy of note that the testimony of the Government engineers Gen. Alexander and Col. Mendell, and of Prof. Davidson of the Coast Survey, has some strong points for the miners, and the evidence of these disinterested experts is valuable. One curious feature is that some of them think there is as much debris brought down from newly plowed lands as from the hydraulic mines. The testimony is worthy of careful perusal. From the seat of war the startling news comes that the Russians are in possession of Constantinople, the stronghold of the Turk, and within the next few days matters of greatest importance to all Europe will be discussed or settled.

Experts in Arizona.

We notice in the Arizona papers a tendency among correspondents to grumble at the actions of the California experts, or would-be experts, in condemning properties which are offered for sale. One correspondent says these men infest the different districts for the reputed purpose of investing in the mines, but in reality "with the sole purpose, as it appears to the miners, of preventing capital from entering the Territory by means of their false and unfounded reports." The same correspondent says the miners ask, "what the devil do they mean?"

Perhaps the best answer to these questions is to state the fact that about ninety-nine out of every hundred of said "experts" are not experts at all, but simply adventurers, looking out for a chance to make some money without spending any. Nothing is easier in the world than for a man to come from San Francisco, represent himself as an expert sent by capitalists from San Francisco to purchase likely prospects, when said capitalists exist in the imagination only, and the expert's expertness consists in making unsuspecting miners believe his stories, and in his ability to make a living without work.

Every mining camp has had experience with men of this class, and still miners allow themselves to be deceived. They want to "bond" mines—which means if they can find some one else to buy another man's property from them they will kindly give the rightful owner about one-quarter of what they receive and retain the rest themselves. If they find no purchasers they are no worse off than before, while they stand a chance of making a good stake without investing a cent. Arizona is a fresh field, and is no doubt full of these people. It may be well to remind our many friends that genuine experts do not go to a country and herald themselves as such, or run around and pass free opinions on every prospect hole in the camp with an air of supreme authority and knowledge. They do not loaf about from one camp to another for six months or so; their time is too valuable for any such nonsense. Men who really know anything, do not flaunt their knowledge before the eyes of others, nor rattle off a string of unmeaning technical phrases for the delectation of a bar-room circle. Should we judge from the reports of the arrival of experts in the different camps in Arizona alone, we should suppose there were now a couple of hundred of these gentry down there from this city, and when we recollect also quite a number of mining frauds who have left here for that country that we know of, it seems highly probable that they are at their old business of expediting. One of these, at least, has been writing letters to the city filled with learned phrases gleaned from books, leading the unsuspecting to suppose that he is really, as he signs himself, a mining engineer, when he is in truth a charlatan, with simply knowledge enough to wear good clothes, talk learnedly of geology and mineralogy, and would be no more fit to pass on the merits of a mine than the greenest "tenderfoot" in the Black Hills. Such fellows deceive the honest miners too often, and if our Arizona friends will only look sharply after the would-be experts there will be fewer of them there next year.

But the miners must recollect, however, that they cannot expect a practical expert and mining engineer to pass favorably on a prospect hole with a ton or two of rich ore on the dump. That kind of business was long since played out. To sell a mine nowadays it must be really a mine. No 25-foot shaft with a few tons of ore will sell a mine for any price to capitalists. The ledges in Arizona though they may be rich on the surface, have not been proven to any great depth as yet, and until some of them are, capital will be slow to come there. Real experts employed by capitalists, report for the capitalists and not for the miner, and if they can see no better prospects than a 10 or 15-foot hole will show, they cannot reasonably be expected to recommend its purchase at large figures.

The Eclipse Mine.

EDITORS PRESS:—Having read in your paper of Saturday last, the letter of Superintendent Nelson, of the "Eclipse Mine," I fully corroborate with him as to accounts.

Having sent, myself, the monthly cost sheets to Mr. Bluett, London, from November, 1876 (when Captain Endey was in charge), until August, 1877, except one, for February, 1877, which Mr. Nelson forwarded, the time our Managing Director, Mr. Hulbert, was with us, I think the manner in which they have behaved and managed in London, can only themselves be blamed for the mine not being a success. Letter after letter, also cablegrams of vital importance have gone to the London office, which they never thought proper to answer, both from Prof. W. T. Rickard, F. C. S., and Mr. Nelson, also they have had generous offers to help them, of which they took no notice whatever.

This is not only unbusinesslike, but discourteous, and I think it most unpardonable of the Directors to allow the extensive property which they hold in trust for the "shareholders" to be frittered away in law.

JOSEPH H. BEAMAN, (late) Clerk.
105 Kearny Street, S. F., Feb. 4th, 1878.

Mining Debris.

Testimony Before an Assembly Committee

The Assembly Committee appointed to inquire into the injury done to the rivers and harbor by the debris carried down from the hydraulic mines in the mountains, have been in session in this city during the week. The Committee comprises D. A. Austin, of Yuba; M. Garver, of Nevada; Byron Waters, of San Bernardino; R. Kercheval, of Sacramento, and J. V. Coffey, of San Francisco. They have completed their labors in this city, and will take further testimony in Sacramento. We append a condensation of the testimony elicited from various parties during the examination this week.

Engineer Arrowsmith.

A. T. Arrowsmith, an engineer, testified that farmers on valley lands on Bear River had been obliged to construct levees to protect their land from debris, but their levees were carried away every year. He estimated that 50,000 acres are liable to be effected by debris. The only remedy he could suggest was for miners to buy up all the lands effected. The old channel of Bear River has been filled up since 1851. Gulches 15 to 20 feet deep, from 100 to 200 feet in width at top, are entirely obliterated. There is no channel of Bear river now—the water spreads. It was represented to me that the debris is from 15 to 20 feet deep in some places in Bear river valley. Went to Bear river to make observations in the interest of the farmers living at the mouth of the river. The land covered is entirely ruined. It is simply a barren sand bank. Did not obtain the information of the quantity of earth washed from the mines. Made my own measurements from information obtained from miners. The tender at the ditch told me he was obliged to sluice out 1,200 feet of the ditch, six feet deep by five feet in width, twice a week. The water was running over the dam constantly.

Captain Corlett.

Capt. William Corlett, who has been running on the Sacramento 29 years, stated that the Sacramento was greatly filled up. At the lower end of Steamboat slough there was 10 or 12 feet of water when I first went up the river, now we have only five feet. The river commenced shoaling badly in 1853. In 1855 we had to keep the channel clear. The filling has been going on more rapidly lately. In heavy winters it fills more. When we have a good summer for the hydraulic mines, a good deal of sediment comes down. San Pablo bay has been filled a good deal from Collinsville. A bar has been formed in Suisun bay. When I first went up you could not tell that a bar existed. Now, at low water, there is quite an island. In 1862 it would have been impossible to have kept the water off the land by levees. The overflow was from highland to highland and small steamers ran overland. The streams have lessened in carrying capacity by being filled in. Some shallow places have filled up entirely. At Sacramento the river has been lessened 18 feet in depth by debris. The average carrying capacity from Steamboat slough to Sacramento has lessened since I first knew it one-half; or in other words, one-half of the navigable space has gone.

Engineer Allardt.

G. F. Allardt, civil and hydraulic engineer, testified as to the existence, of a large body of sediment in the river waters, which is filling up the channels and bays. He said: On the Oakland shore and at Richardson's bay have filled up about half a foot in late years. The reclamation of the tide lands, if thorough, would confine the waters in their own channel, which would in times of flood cause the deposits, by increased force of the stream, to be carried further in the bay. I would not like to say what effect it might have on the bar. Mission bay will in time become dry land. The shoaling and filling in will only hasten that result. The removal of large quantities of material from the mountains and depositing the same in the bay of course is doing great injury to the bay. Cannot say what proportion of the material washed from the hydraulic mines reaches San Francisco. Some portion certainly reaches here, as the water is much discolored.

Colonel Mendell.

Col. Mendell, one of the U. S. Board of Engineers for the Pacific coast, who is in charge of the improvements on the Sacramento river and the construction of the Oakland harbor, said the only way in which the shoaling of the bay could be ascertained would be by proper surveys. Sand bars are usually got rid of by dredging or by increasing the current. If it then forms in another place it has to be treated in the same manner. The natural and artificial causes all tend to reduce the mountains to the level of the sea. Frosts, floods and ordinary actions of time are working to reduce the hills and fill up the harbors. The lands around the bays, which are near the level of high water, were formerly below the level of low water, and have been filled up, and the natural causes are to destroy the harbors. The first survey of the bay was made by an exploration party under Capt. Wilkes, which was sent here in 1841. It was so superficial that no comparison can be made of the depth of water on the bar at that period and now. Another survey was made by the Coast Survey in 1855, and another in 1873. A comparison which I have made between these two surveys, shows more water on the bar now

than in 1850. I would not give that as a fact that there is more water now than before, but there is not any less. Col. Mendell produced profiles of the bar and tide line made by himself from the coast surveys named, and presented the Committee with the same. Witness then continued: The effect of storms does cause bars to shift a little. From the survey of '55, the depth of water between San Francisco to Goat island ranges from seven fathoms at Market street to 24 fathoms close in by the island. The bar outside of the bay is the battle-ground between the sea on one side and the tidal current on the other, and the depth of the water on the bar is the result of the contest. If you diminish one force or increase the other, you will see the effect at once on the bar. Whatever matter is thrown into the bay, it has an increasing influence on the bar. Tide lands have been formed by deposits by the currents. About 158 square miles of the land around the bay has been so formed. This was made before hydraulic mining commenced on the coast. Before the State takes any movement to devise any means for the protection of the farmer and miner, the whole facts of the case should be ascertained. I would not give a snap for the opinions of all the people of California when compared to a few facts. With the facts before a board of engineers, a solution could soon be obtained. It is not a light matter any way you can look at it.

Fish Commissioner Redding.

B. B. Redding testified: I have had occasion to watch the effect of the mining debris along the banks of the rivers. Between 1850 and 1860 there was a large quantity of bottom lands on Bear river, but since the commencement of hydraulic mining it has been filled up until a railroad bridge crossing the river has had to be raised three times to keep it above high water mark. By forming a reservoir or bed on which the water can be turned to deposit its matter, the danger which will result as it now stands may be avoided. The matter comes down from the mountains and must go somewhere.

General Alexander.

Gen. Alexander, one of the U. S. Board of Engineers, said the debris from mining had done more or less injury to the farming land. Originally the Sacramento river carried less sediment than it does now. The sediment is deposited in the bed of the river, in Suisun bay, and in San Pablo bay, and then it comes down into this bay, particularly on the Oakland side. The plowing up of the lands and making it easy to be washed away also fills in the bed of the rivers. Which of the two causes is the greatest I cannot say.

Because a river carries a large amount of sediment it does not necessarily follow that there is a mine at the head of it. The Mississippi, with a less fall than the Sacramento, takes down sediment in a year sufficient to form a tract of land one mile square and 270 feet high. This matter has been found to consist of very fine powdered sand. The bar at the entrance of the bay is not formed, in my opinion, by deposits from the river, but solely from the sea during heavy southerly winds. If all the waters could be confined to the rivers the current would keep the bottoms clear. By building walls as on the Nile, 200 feet base and 50 feet high, or levees to keep the waters inclosed, the sediment will be disposed of. That may have the effect of filling up Suisun bay, but that will be filled up by natural causes ultimately. From natural causes the rivers keep muddy from the middle of November to the middle of March, or about one-third of the year.

The amount of space washed by mines is small compared to plowed lands, and the muddy water runs off through creeks into the river. I have been familiar with the waters of the Sacramento for 11 years. In that valley the hilly lands do not absorb the water which runs off. In level land the water does not run off at all, except in very heavy rains. There is no dead level land between the foothills and the river, but there is some about Colusa and Marysville. Some of the tule land is very level. From the base of the foothills, where the farming lands generally end, to the tules, the fall is about six or eight feet per mile, maximum. It is impossible almost to strike an average fall. The slope is greater at the foothills and grows less as it approaches the river. Regarding the west Side Irrigation Company: The San Joaquin and King's River canal has a fall of 12 inches to the mile, and that was so strong a grade that it washed the banks and the grade had to be leveled.

Mr. B. B. Redding.—I have been acquainted with the Sacramento river since 1850. It was not as muddy then as now. At Sacramento the river was as clear as crystal in 1850, and the American likewise. In summer California rivers are naturally clear, and if they are muddy it is from artificial causes. At Sacramento, the river has filled from 20 to 25 feet since 1850. A schooner sunk there then and cannot be found now. For the full length of the city, say three miles, it has filled up 25 feet. The river used to be approached by steep banks, and vessels took freight five miles up the American. The bars are all the time working down. Every year the floods lift up the sand and take it down stream by stages. In the flood of 1862 the water rose 24 feet above low-water mark. There are now three low-water marks, but the original one was based on 24 feet below the flood. I think the river has filled up 10 feet on an average since the flood.

Mr. Kercheval said that where steamers used to run without difficulty, small freight

boats now drag on the bottom. This rule is general.

Harbor Pilot Joliffe.

Capt. H. W. Joliffe testified: Have been a harbor pilot for 27 years. The pilots have an idea that the southern part of the bay is shoaling. Perhaps the ships are larger now than they used to be. One ship struck the bar at 23 feet, and another at 21. In the channel I don't know as any shoaling is going on. I think that ships are drawing more than formerly, and that may be a reason. Twenty years ago, we pilots never thought anything of the bar, but it is breaking now, more and more, every year. That indicates shoaling, for there are no breakers in deep water.

Captain Mayo.

Captain Charles Mayo testified: There is a substance which you draw up inside the Heads, but outside toward the Farallones, you do not find this substance. It looks like a disintegration and resembles iron from the hills. The pilots fancy the bar is getting wider—that is, no pass through breakers that were unknown twenty-five years ago. Whether this increased width comes from off shore not, I do not know. One fact is curious. On a dark night, if the captain wants to know where the ship lies in relation to the bar, we drop a lead. The substance brought up from the bottom inside the bar is not found outside. Therefore we can readily determine where the ship lies. This may throw some light on the subject. This is the only safe harbor on the coast, excepting, perhaps, Puget sound. San Diego harbor is not bad. The sea coming in from off shore southwest or south-southwest, is the cause of the breaking on the bar, while it is constantly being added to by the sand.

San Francisco Harbor.

Mr. Arrowsmith submitted an answer to a question propounded as to the injury done to the San Francisco harbor. He said the harbor has not been injured so far, because the debris has mostly settled in Suisun and San Pablo bays, especially in the former. As soon as these bays are filled, the debris will be deposited in the bay of San Francisco and at the bar.

The President of the North Bloomfield Mine.

Mr. Robinson next testified—He has been connected with the North Bloomfield M. Company as President, and also has large interests in farming. He said that the operations at the mine in Yuba county, which are large, shows that the average result is that one miner's inch of water removes one cubic yard of gravel. The material which reaches the farming land is very fine, and will not average three per cent. of the amount mined. The quantity deposited in the bays would not be likely to do injury. That deposited along the rivers is not altogether of bad effect, as it can be used in filling up low lands, etc. A large amount of the deposits left in the bay are the results of agricultural operations and the digging of canals, as well as through the simple operations of nature. If the mines must be closed to stop these deposits, farming should also be stopped. The investigation of the question should be left to unpartisan, scientific commission, totally free from local prejudices.

In answer to questions put by Assemblyman Kercheval, of Sacramento, the witness stated that seventy-five per cent. of the earth and gravel removed by the placer miners is deposited in the canyons in the vicinity. The reason that the San Joaquin was not filling as fast as the Sacramento river was because the country was comparatively new, and agricultural operations were not as extended. The Sacramento, above the Feather, was not filling as rapidly as below, because the current was stronger. From close calculation by himself, a small stream on his ranch, with a watershed of only 12 square miles has deposited over 2,500,000 cubic yards. The land drained by the stream was in the foothills. The Upper San Joaquin was comparatively clear in the dry season because the current was rapid.

In reply to the Chairman, Mr. Robinson stated that all the rivers from the foothills down were filling. This he thought was owing a good deal to natural causes. The same changes were going on all over the world, and were not wholly due to hydraulic mining—in some places not at all. The damage done to farming lands at the mouths of the upper rivers was largely due to hydraulic mining. The deposits left in the lower rivers and bays, however, were not due alone to the same causes. The witness thought the city of San Francisco had invested \$50,000,000 in hydraulic mines and ditches, which were worth from \$50,000,000 to \$100,000,000. He thought these mines paid more than six per cent. interest on capital invested. Agricultural lands he did not think paid more than three or four per cent.

A Hydraulic Engineer's Testimony.

Hamilton Smith, Jr., civil engineer, testified as follows: Had for some time been engaged in hydraulic engineering. He thought that San Francisco alone had invested from \$35,000,000 to \$50,000,000 in hydraulic mines. He thought that if hydraulic mining was not interfered with, the yearly product will soon reach \$25,000,000 per year, and this rate will be kept up for many years. This year the production of the gravel mines will reach \$14,000,000. The increase of product will be due, not so much because of the larger extent of ground worked, but on account of the increased value of the ground. The bottom gravel, which will be worked in the future, is much heavier than what has been worked in the past, at least half of it being too heavy to be washed down lower than the canyons of the Yuba river. Large stones were washed down

into the Yuba canyons, and act as dams to stop the sediment and coarse sand from being washed down to the lower rivers and bays. The Yuba canyons would hold more than the amount of gravel which will ever be washed from the hydraulic mines. Very much more of the deposit washed down into the bays was on account of natural causes and agricultural operations, than from mining. The filling in of Suisun bay would not be deplorable, as the land so formed would be the most fertile in the State. The land along the shores of the lower part of San Francisco bay were formed from these deposits. There should be a complete system of levees, instead of having each land-owner operate separately. In some places on the San Joaquin, the width of the river has been so reduced that if the levees stand, the result will be that, in case of a flood, the water will be backed up and flood Stockton. The same would be the case on the Sacramento should the levees on Grand island stand. As far as his knowledge went the navigation of the Feather river has not been impeded of late years. The quantity of water which will be stored in large reservoirs soon to be finished, and which will be used in the dry seasons, will be so great that it will help navigation in the Feather river, especially in the summer months.

As to the shoaling of the bar, the filling up of the rivers would not effect this, unless the filling is done above the low-water line. He thought that the filling in of ground caused by the building of San Francisco, did more to decrease the tidal area than all the hydraulic mining. Did not think that the filling of Suisun bay would cause the deposits to be backed up in the country behind it. A great many years would elapse before Suisun bay would be filled up. The witness thought that a committee of competent engineers ought to be appointed to inquire into the question properly. He thought that at least \$500,000 should be appropriated for two years work.

Capital Invested in Placer Mining.

James P. Pierce, who is engaged in both farming and mining, was next sworn. Had been interested in mining 22 years. He thought that \$50,000,000 had been invested by San Francisco capitalists in placer mines, the value of which was from \$100,000,000 to \$150,000,000. He thought inside of five years the annual product of the placer mines will be in-

RETORT GAS STOVE COOKING APPARATUS.

creased to \$20,000,000 per annum. The expense of working these mines would not be so great in the future, in proportion to the product, as in the past. From one-half to three-quarters of the surface gravel of mines in which he was interested had been washed off. The value of the lower stratum in proportion to the upper is about four to one. Of the dirt at present being washed away at the Smartsville mine, Nevada county, one-half of it is too heavy to be washed on the lowlands and into the rivers and bays. This is the case at all the claims, the debris of which is deposited in the canyons of the Yuba river. Farming lands owned by the witness had been covered by deposits washed from the mines. The result was that land which was bought by him for \$5 per acre was paying interest on \$200 per acre. Five crops of alfalfa per year had been cut from this land. Land washed in Nevada county by this muddy water produced much more per acre than land in El Dorado county irrigated with clear water. Much land along the rivers, which produced nothing but mosquitoes, could be filled in by this deposit and made to produce 60 bushels of wheat an acre.

A large portion of the testimony was confirmatory of the testimony given by Hamilton Smith.

Mr. Kercheval, of the Committee, stated it had been his experience that this deposit was worthless. He also said that where, some years before, boats drawing eight feet had been run on the Feather river, now boats drawing only two and a half feet dragged the bottom.

Mr. Smith, engineer, stated that the lower gravel was worth 10 times as much as the surface gravel. This lower gravel is so much heavier than that on the surface that two and a half times as much water is required to move a given amount of dirt.

Condition of Sacramento River in 1850.

Egbert Judson, who is largely engaged in the manufacture of candles, powder, acids, etc., was next sworn: Most of these articles are used more in mining than in anything else. He had gone up the Sacramento in 1850 in a whale boat, and the river was so low in places that he was obliged to tow the boat part of the distance. Since then the river was never so low to his knowledge.

Professor Davidson.

Prof. Davidson, of the U. S. Coast Survey, testified: Regarding the formation of the bar, of which I have been acquainted for 27 years, we have a strong current going down the coast and one nearer the shore going north. This makes the southern points of all inlets, harbors, etc., sandy, while the northern points are of rocky formation and the bars are sandy. Our bar is formed by the sand pushed up along the shore line by the northerly current. The same can be seen at San Diego and Wilmington. In 1853, we made a survey of the approaches of San Francisco bay. The soundings were made to the nearest foot, running slightly under the nominal depth. For the last 20 years there had been no perceptible shoaling of the bar of San Francisco. If any had been going on, we certainly should have known it by the change in the soundings. There was a deposit of sea urelins there in 1853, and is there yet, showing no change has taken place, for any sediment over them would have destroyed them. As to the river deposits and their effect on shoaling: In early times very little sediment was brought down our rivers, because grass grew all over the country; but now the plowed lands discharge considerable soil, etc., which is consigned to the bay. As to the effect produced by the mines, I should say that their deposits form but a small proportion of debris compared to that produced by plowed lands. In fact, I think that the substance which causes the general shoaling is mainly brought down from plowed lands. It may take a long time to prove what effect it has on the bar, but not on the bay; however, the bar is susceptible of the greatest injury. I have seen the Sacramento river in all times, seasons and stages, but am unable to testify regarding its shoals, because I have not made any examination of the local causes thereof. My business has been more especially that of surveying the coast and bay. I have known large deposits to be made in the Dela-

RETORT HEATING STOVE.

ware river from plowed lands. Examinations of rivers have shown me deposits of wood, soil, leaves, etc., in the beds, in several instances 40 feet deep. There is no doubt that rivers are constantly undergoing shoaling from deposits. This is especially noteworthy in the Columbia river, where, 16 miles inside the mouth, harbors are now filled up and useless that a few years ago were constantly used by pilots. This great river receives tremendous deposits constantly. As to the Sacramento river, the channel must in due time fill up and become obliterated; and this is shown at Colusa, where the banks are 20 feet higher than the adjacent country. Rivers have a tendency to fill up and raise their channels, and, in fact, all our streams run on a crest or ridge. In floods, the water overflows and fills up the concomitant sloughs. This has the effect of throwing off a large quantity of debris out of the river proper into the valley on both sides, where it settles and becomes quiet. Regarding the reclamation of tide lands: If you throttle any harbor, you confine the tidal prism into a small area of water and deposition will proceed more rapidly. If no material is brought down, then there will be no decrease of water on the bar. Throttling a harbor is always hazardous.

Mr. Kercheval said it was going to be charged in the report that the reclamation of tide lands had the dangerous effect of filling up the bays. If so, he wanted an investigating committee appointed to discover and report that these regions had never been overflowed by tides to decrease the tidal area. The testimony of settlers on and near Sherman and Grand islands would prove that the tidal area is not being lessened by overflow.

Prof. Davidson—All those levees being built would have a tendency to throttle the mouths of rivers and to create back-water. The gentleman then said this question was very difficult and could not, he was satisfied, be settled unless several men would be appointed to give their whole time to it and investigate it. He knew the popular feeling against Commissioners, but thought that one should be appointed to investigate the matter. In response to an inquiry by Mr. Byrne, as to the probable cost of the work, he said he would make an estimate on the appropriation necessary for the payment of the two men to compose the Commission.

Mr. Kercheval said he was satisfied that a scientific investigation was needed, and asked Prof. Davidson when he could have his statement ready, and the latter replied within a few days. He recommended a physical survey of the State, saying that it would be a grand advertisement East and abroad and that it would be a beneficial undertaking.

The Retort Gas Stove.

We illustrate on this page a new gas stove for cooking or heating, office or house use, which has just been introduced on this coast by Mr. W. H. Seamans. The retort gas stove was invented by a distinguished physician and expert in the chemistry of gases and philosophical engineering, and is constructed on an entirely new and scientific principle.

The principle which enables this stove to produce an effective heat, with less gas than required by all others, without explosions, smell or smoke, consists in the novel mechanical arrangement of its parts and the superheating of the gas itself. Gas expands one four hundred and eightieth part of its volume for every degree of heat added—hence if taken into the stove at a temperature of 32° Fahr. and subjected to a heat of 960° Fahr., one cubic foot becomes three cubic feet by expansion and the density of the expanded gas is proportionately less. The admixture of air with the expanded gas is arranged with such accurate mechanical skill that combustion is perfect, whether one foot or twelve is burned, and the flame thrown evenly over the surface of the dish, so that all its parts are heated uniformly. The flame can be turned down so low as scarcely to be seen, still maintaining perfect combustion, and never flies back, causing explosions, under any circumstances. Currents of air cannot disarrange its cooking or heating qualities, the construction being so peculiar and ingenious that it cannot be clogged by anything spilled upon it, nor will it be changed by time or disuse, but will be found perfectly serviceable for years.

The principle on which the stove operates is simple. By passing the gas into the red hot retort, it is superheated before its union with the air. By superheating the gas is expanded three times in quantity, so that when it unites with the air the union is fully up to the maximum of perfect combustion, and at least 33% more heat is produced out of the same amount of gas than with other gas stoves.

Many persons object to gas stoves from an idea that they are more expensive than the ordinary stoves. This is not the case. The agent informs us that five feet of gas per hour affords a practical cooking heat. At a cost of \$3.75 per 1,000 feet, using two burners, and allowing one-half hour for cooking, the actual expense for fuel would then be less than two cents per breakfast. The gas is heated before being burnt. By heating the gas is expanded, and the air then unites with it. By being expanded or rarefied it is possible to unite three times the air with the same amount of gas as other stoves. In others the combustion amounts to a union of the common gas with the air; in this a union of the expanded gas with the air. By this process a perfect combustion is effected, so there is not a particle of smell of gas or smoke.

These stoves have been tested by some of the most eminent gas engineers in the country, and been recommended by them. The engineers of the gaslight companies in the principal cities of the United States recommend this stove—for instance, in Washington, Brooklyn, Albany; Pittsburg, Cleveland, Chicago, St. Louis, Memphis, Troy, Rochester, and others. There is no danger whatever from explosion in the use of these stoves, and they are light and compact, so they may be easily removed. Mr. Crockett, engineer of the S. F. Gaslight Co., has examined and tested the Retort gas stove and given it his approval and recommendation.

They are made both for cooking and heating purposes. Fig. 1 of the engravings represents a No. 3 cooking stove with oven. Each of the small stands is a stove in itself, and can be used separately or all together. Fig. 2 shows a heater for offices, halls, parlors, etc. The price of these stoves ranges from \$2.50 to \$14. The stove can be seen in operation at any time at Thomas Day's, 122 and 124 Sutter street.

BULLION SHIPMENTS.—Since our last issue shipments of bullion from the prominent mines have been as follows: Obollar, Jan. 30th, \$6,253.06; Northern Belle, 28th, \$2,309.90; Tybo, 25th, \$8,758.12; Alps, 31st, \$1,571; Bechtel, 31st, \$15,947.68; Northern Belle, 30th, \$3,195.40; Grand Prize, Feb. 2d, \$31,000; Leopard, 2d, \$4,400; California, 2d, \$189,578.31; Con. Virginia, 2d, \$188,526.29; Chollar, 2d, \$7,083.71; Day, Jan. 31st, \$1,182; Tybo Con. 31st and 29th, respectively, \$9,149.84, \$8,891.41; Northern Belle, Feb. 2d, \$3,050.12; Grand Prize, 6th, \$27,100; Manhattan, 2d, \$8,316.58; Martin White, 1st, \$16,087; Arizona, 2d, \$1,934.38; Endowment 4th, \$1,705.42; California, 5th, \$303,831.21; Con. Virginia, 5th, \$175,122.97; Alps, 5th, \$2,371.

The coinage at the Mint in this city this month was \$1,855,000, of which \$1,335 was trade dollars, and the balance \$521 pieces.

SMALL-POX excitement continues in Yamhill county, Oregon. Five deaths have occurred from the disease.

Matters at Mosquito Gulch.

A correspondent of the Calaveras Citizen, writing from Mosquito Gulch, in that county, says: The rain has come at last, and farmers and miners alike share the blessing. The gulches are full of water. The mills are running and the precious metal is being taken out of the earth for the benefit of us poor fellows who labor. We heard three whistles at noon to-day. The old San Bruno has all three engines at work, and a full crew of men will be employed in a few days. The Banner mine has just struck rich ore, and the Blue Jay has just struck the precious metal again. We expect good times here this summer.

If it were not for the mineral land being patented for farming purposes, this would be a good poor man's country yet. But we, as miners, are like the frontiersmen, we have to go back up in the mountains, so as the rancher can't follow us up. For as soon as he can get a surveyor, he will survey out his land, and then comes the old cry, "this is my land," and yet just as soon as the miner can get a claim that no one claims, here come all the ranchers that can raise a cabbage head or a pound of hay to the miner to get his money for his produce. But let the miner go inside the rancher's survey, and commence to sink a shaft, and see how soon he is driven out. If the miner wants to buy the quartz vein, the rancher will ask him two prices for it. The little town of Mosquito has the trouble of patented land.

This little town is situated in the best mining position of Mosquito Gulch. Mr. McNoble bought the ranch the town was located on. As soon as he bought the ranch he commenced to dispossess all the people of the property. He had a lively time of it. The people are going after the patent.

Information Concerning Patents

FOR THE

AUSTRALIAN COLONIES,

EAST INDIA, Etc.

The geographical position of San Francisco, and the fact of having a regular communication by means of a line of steamers renders our location here particularly favorable for taking out patents in these colonies for United States inventions. For the same reasons we include with these instructions those for the East India patents. American inventors, as a general thing, are not aware that Australia presents a better field for them to patent their inventions in than almost any other country, the United States and England excepted.

Comparatively little is known in the United States of this vast continent situated at the antipodes, and the almost fabulous richness and depth of the soil, the vast strides with which she has advanced in population and wealth are little known.

A correspondent who has lived 19 years in Australia, says: "I have been a little surprised about one thing in connection with your inventors, and that is that they don't make more use of the patent laws of these colonies. It is true that it is somewhat expensive to patent in all the colonies, still it would pay in some cases, and in others it would answer to patent an invention in two or three of the colonies. An efficient reaper and binder would pay to patent in all the colonies; so would an invention for preserving raw meat, or for benefiting those engaged in wool growing, while any really good invention for the benefit of those engaged in gold mining might be advantageously patented in three or four of them. Many American inventions have already been patented here, and have been very remunerative, and, as a rule, when properly pushed, almost any good invention might be made valuable if patented here. Ten times as many British inventions are patented here as American ones, yet it is notorious that the inventive faculty is not near so largely developed in them as in the Americans."

The continent of Australia has an area of 3,000,000 square miles, or nearly as much as that of the United States. A large portion of the interior is waste and unsettled, but wherever the colonies have made a start they have made rapid progress, in population and civilization.

There are seven Australian colonies, five of which are upon the continent, and the other two upon the adjacent islands. Of those on the continent four only are of considerable importance, namely, Victoria, New South Wales, Queensland and South Australia. The fifth—Western Australia—is separated from the rest by nearly 2,000 miles, and is used as a penal station by Great Britain. The island colonies are New Zealand and Tasmania, the first consisting of three islands of considerable size, while the last comprises one island. In importance these colonies stand at present in the order named (leaving out Western Australia), and have a united area of 2,136,180 square miles, with an aggregate population of upwards of 2,110,368 inhabitants. Each of these colonies has a well arranged patent law, and many of the inventions patented in the United States, could be advantageously patented and introduced here.

Victoria.

The first colony in population and importance, though not in size, is Victoria. This colony has an area of 88,198 square miles, and a population of about 800,000 inhabitants. The capital of Victoria is Melbourne, a city of upwards of 240,000 inhabitants.

A patent may be obtained in this colony for any new and useful manufacture. An invention already patented elsewhere may be patented at any time during the continuance of the prior patent, provided it has not been used or illustrated in the colony. An examination is usually made to determine the novelty and utility of the invention.

A patent may be obtained by the inventor whether resident or non-resident, but a mere importer cannot become a patentee. The documents required to obtain a patent are petition, specification and drawings in duplicate and of a given size, one copy being on parchment. The specification must be signed and sealed by the inventor. No model is required.

The term of a patent is fixed at 14 years but expires with any prior patent. The patent is not required to be worked in the colony. It is subject to a tax of £15 at the end of the third year, and one of £20 at the end of the seventh year. The expenses of a patent for three years, inclusive of government tax and all charges is \$200.

New South Wales.

This colony has an area of 323,437 square miles and a population of about 600,000. Its capital is Sydney, situated at the head of a magnificent harbor, and distant from Melbourne about 600 miles. The pastoral and mining interests predominate at present, and the colony is in a highly flourishing condition.

A patent or letters of registration, as the document is called, may be obtained in this colony for any invention or improvement. The term is 14 years and a preliminary examination is had to determine the novelty and utility of the invention. The patent may be obtained by the inventor, his agent or assignee, either colonist or alien.

The documents required are a petition, duplicate specifications and drawings. The law does not require the invention to be worked. The cost of a patent for the entire term, including government tax and all other expenses, is \$250.

Queensland.

This colony was set off a few years since from New South Wales, and has an area of 678,600 square miles and a population of upwards of 150,000. Its capital city is Brisbane.

A patent is granted in this colony to the inventor, his agent or assignee, for the term of 14 years, the same as in New South Wales. The documents required are also similar, a petition, duplicate specifications and drawings. The cost of a patent for the entire term, including all charges, is \$250.

South Australia.

This is the largest of the colonies, having an area of 914,730 square miles and a population of 198,257. Its capital is Adelaide.

Patents are granted in this colony for 14 years, an examination being made as to novelty. The documents required are a petition, duplicate specifications and drawings. The entire cost of a patent is \$250.

New Zealand.

This colony has an area of 105,000 square miles, and a population of 310,437. Its capital is Wellington, and its principal city is Auckland.

Letters patents in this colony are granted only when application is made there before anywhere else. Letters of registration, however, are issued to *bona fide* holders of letters patented elsewhere, and have the same force as, and expire with, the original patent. To obtain letters of registration, a certified copy of the specification, drawings and prior letters patent, and a declaration of the applicant that he is the *bona fide* holder of such letters patent, must be filed. If made by the assignee, a certified copy of the assignment and a declaration of the applicant must be filed. The entire cost of letters of registration in this colony is \$200.

Tasmania.

Patents are granted in this colony in essentially the same manner as in Victoria, and for the same time. The total cost is \$200.

Trade-Marks.

Trade-marks may be registered in the colonies of Victoria, New South Wales, Queensland, New Zealand and Tasmania. The cost of a Victorian trade-mark is \$60, and of the other colonies mentioned, \$50 each.

EAST INDIA.

An East Indian patent is granted for a term of 14 years, and must be for a new invention of public utility. The applicant must be the inventor, his executor, administrator, or assign, and may be a resident, non resident, British subject or alien.

The documents necessary are a petition, declaration, specification and drawings, together with five copies, one for each of the Presidencies. The cost of an East Indian patent is \$300.

Inventors will please write for any further information desired concerning the above colonies, the Canadas, and other foreign countries. Our American and foreign patent circular will be sent free on receipt of postage stamp. Samples of our first-class illustrated newspapers will be sent postpaid on receipt of 10 cents.

DEWEY & CO.,

Office of the MINING AND SCIENTIFIC PRESS and PACIFIC RURAL PRESS, San Francisco.

WOODWARD'S GARDENS has the following new attractions The buffalo chase; large whale skeleton; new museum; improvements in the zoological department, besides the other features which have made it popular.

MODEL MAKER AND MACHINIST.—I. A. Heald, No. 514 Commercial St., San Francisco, (fourth floor).

The Mining & Scientific Press.

Established in San Francisco in 1860, is now the Largest, Most Original, Best Illustrated, and Most Ably and Carefully Edited Practical Mining Journal on the Western Continent. Its contents are made up of fresh intelligence in a condensed and interesting style, easily appropriated by the reader, who finds its columns replete with new facts and ideas not obtainable in the books of the past, nor in any other of the journals of the day.

Varied in its carefully compiled and conveniently arranged departments, representing the special and leading industries of the Pacific States—Mining, Mechanism, Manufacturing, Building, Improvements and Inventions—it becomes a weekly informant to all Scientific, Mechanical, Manufacturing and Industrial Progressionists on the coast, an immense list of whom testify to its pleasant, profitable and elevating influence.

Let every friend of Science and Industry on this side of the continent take pride in sustaining and advancing a faithful representative of their special interests by subscribing for the PRESS, and urging its patronage by others—without delay.

Subscription, \$4 per annum, in advance.

A \$1.00 Book for Every Reader.

THE ILLUSTRATED

National Pronouncing Dictionary

—OF THE—

ENGLISH LANGUAGE.

Orthography, and Pronunciation according to the best English authorities, with an appendix containing abbreviations, foreign words, phrases, and forms of address TWO HUNDRED AND FIFTY ENGRAVINGS.

The design of an English Pronouncing Dictionary is to exhibit the pronunciation of the language as it is current in educated society. It must be admitted that of all the expedients which have been devised to serve this important end, the phonetic is by far the simplest and most effective. The orthoepical department of this dictionary is, therefore, phonetical. The usual orthography of every word is re-spelled in such a way as to show at once how it ought to be pronounced. By means of this mode of spelling, combined with proper accentuation and syllabification, a correct pronunciation is exhibited without confusing the eye or perplexing the memory, with a long array of orthoepical notation—an advantage of the utmost importance in any dictionary.

The generally accepted orthography of the language is maintained throughout the work, and the definitions are sufficiently numerous for all ordinary requirements. The illustrative engravings—an entirely new feature in a school dictionary—will greatly aid the pupil in understanding the given definitions. On the whole, it is not too much to say, that this dictionary meets a great requirement of the age. By reason of the completeness of its component parts, the compactness of its form, and the lowness of its price, it is sure to command a very extensive circulation wherever the English language is spoken.

DEWEY & CO.

American & Foreign Patent Agents

OFFICE, 202 SANSOME ST., N. E. COR. PINE, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) sooner than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

DEWEY & CO.

United States and Foreign Patent Agents, publishers Mining and Scientific Press and the Pacific Rural Press, 202 Sansome St., N. E. corner Pine, S. F.

Among the advantages gained by this holder are the following:
It can be opened and closed quickly.
The papers are less obstructed while the articles to be filed are being placed.
The papers (wholly or partly folded) can be either "straddled" over the lower bar, or filed in regular book order.

The elastic hinge and band accommodate and hold firm either a large or small number of papers.
With less material, it is lighter and less cumbersome than other holders, and approaches nearer to bookbinding.
It has no rigid hooks, hinges or loose parts to break or get lost.

It has proved durable in practice. The file is adjusted but 52 times a year for a weekly paper, and a sample holder can be opened and closed 1,000 times without slowing wear.

Five sizes are made to suit the dimensions of different papers, viz.: 18, 22, 26, 30 and 34 inches, inside measure. Single samples will be mailed from office for 50 cents, (and upward, according to size), postpaid. Wholesale and retail agents wanted.

TWENTY-FIFTH YEAR—1878.

Hall's Journal of Health.

Contents of a Single Number:

The Little Courtesies of Life; Coughing in Consumption; Influence of Christianity on Medical Science; Ignorance and Ill Health; Rage and Ruin; Kindness the Best Punishment; Grass in Rain; Valuable Table; Incurable Insanity; Consumption—A Suggestion; The Spirit Rapper Premium on Babies; Our Proverbs; Wrecked Clergymen Marrying Well; The Lifting Cure; Sea Sickness; Face Painting; A Filthy Atmosphere; The Latest Crazy Man; A Suggestion; The Erie Railway; Sick Children.

Published in New York. E. H. Olcott, M. D., Editor.

This journal has maintained the highest record of any health journal issued in the English language. It is not the amount of matter published which makes it the most valuable journal, but the plain and condensed truths it furnishes concerning that which is of ever vital importance to its large list of readers.

Annual subscription (post-paid).....\$1.50.
To subscribers of this paper.....75 cents.

J. M. WEBSTER,

Proprietors.

THE CLIMATE OF CALIFORNIA.

A thoroughly studied and ably written treatise on this subject by Hon. B. B. Redding, appears complete in the PACIFIC RURAL PRESS for January 20th, and also the MINING AND SCIENTIFIC PRESS. Based upon facts, figures and careful and extensive observations made in various parts of the State on this important subject, it is a volume of reliable information, interesting to every resident of the State. The information is condensed in a paper read before the California Academy of Sciences, and is published in the PRESS as read before that Society without any alterations or omissions. Extra copies, post-paid, 10 cents. Address DEWEY & CO., Publishers, 202 Sansome Street, San Francisco.

25 Fashionable Cards, no two alike, with name, 10c. postpaid. OEO. I. REED & CO., Nassau, N. Y.

ARITHMETIC MADE EASY BY ROPP'S EASY CALCULATOR.

This valuable work is used by thousands of farmers, mechanics and business men, and is highly recommended for its practical utility and convenience.

It embodies an entirely new system of calculation, by which a vast amount of figures and mental labor—required by the ordinary methods—and fractions with their complexities, are absolutely avoided.

It is so simple and easily comprehended that even the most illiterate is enabled, in a few minutes, to reckon with absolute accuracy and speed; while its original and rapid methods, benefit and delight the most scholarly.

It shows at a glance the accurate value of wheat, corn, rye, oats, barley, cattle, hogs, hay, coal, lumber and merchandise, from one pound to a car load, and for any price the market is likely to reach.

It gives the interest, simple and compound, on any sum, for any time, at six, seven, eight, and ten per cent.; the exact measurement of boards, scantlings, timbers, saw logs, cisterns, tanks, wells, granaries, bins, wagon beds, corn cribs, etc., the wages at various rates, for hours, days, weeks and months; besides numerous other important methods, rules and tables.

It is printed on fine tinted paper, is well and elegantly bound in pocket-book shape, and accompanied by a silicate slate, pocket for papers, and memorandum, which can be replenished in the two latter styles.

It answers the purpose of a pocket book and diary, and costs no more, although it was gotten up at great expense and labor, and is unquestionably one of the most useful publications ever issued from the press.

Price, bound in Fine English Cloth, \$1.00.

Sent direct from the Eastern publisher, postpaid, on receipt of price, by P. O. order, registered letter or receipted by express. Address

DEWEY & CO., San Francisco.

Contents of Pamphlet on Public Lands of California, U. S. Land Laws, Map of California and Nevada, Etc.

Map of California and Nevada; The Public Lands; The Land Districts; Table of Rainfall in California; Counties and Their Products; Statistics of the State at Large.

Instructions of the U. S. Land Commissioners.—Different Classes of Public Lands; How Lands may be Acquired; Fees of Land Office at Location; Agricultural College Scrip; Pre-emption; Extending the Homestead Privilege; But One Homestead Allowed; Proof of Actual Settlement Necessary; Adjoining Farm Homesteads; Lands for Soldiers and Sailors; Lands for Indians; Fees of Land Office and Commissions; Laws to Promote Timber Culture; Concerning Appeals; Returns of the Register and Receiver; Concerning Mining Claims; Second Pre-emption Benefit.

Abstract from the U. S. Statutes.—The Law Concerning Pre-emption; Concerning Homesteads; Amendment Act Concerning Timber; Miscellaneous Provisions; Additional Surveys; Land for Pre-emption; List of California Post Offices. Price, post paid, 50 cts.

Published and sold by DEWEY & CO., S. F.

Smelter and Refiner.

A competent person is desirous of receiving the position of Superintendent of a Smelting and Refining Works. Can give satisfactory reference for ability to smelt all lead ores, refine silver and make market lead. No objections to go to the Territories. Address P. F. M., this office.

Copp's Hand-Book of Mining Laws.

Henry N. Copp's hand-book of mining laws, just issued, contains the United States mining laws and instructions to be used, a digest of decisions, forms, list of mining patents issued, etc. The digest of decisions alone is a very valuable thing, giving, as it does, in brief form, all the decisions of the Secretary of the Interior and Commissioner of the General Land Office in relation to mining matters. These are all under proper headings for easy reference. Forms are given for notice of location, proof of labor, notice of forfeiture, miners' lien, application for survey, patent, etc., affidavit of improvements, etc. There is also a list of patents issued for mining claims from July 20th, 1866, to August 1st, 1877. The book is of pocket size and very convenient for all who are interested in mines. It will be sent post-paid for \$1, on application to Dewey & Co., 202 Sansome Street, San Francisco.

MINING INTEREST FOR SALE.

For a small amount, in several claims on one of the

RICHEST LEDGES IN ARIZONA.

Money needed for development. The ore will pay a handsome margin to ship to the city. Apply at this office

The Latest and Most Complete Manual.

THIRD EDITION OF

Skidmore's Mining Statutes,

WITH INSTRUCTIONS, DIGEST OF JUDICIAL AND

DEPARTMENTAL DECISIONS, RULES OF PRACTICE, FORMS FOR SECURING AND CONVEYING TITLE, SPECIAL STATUTES,

AND INDEX.

We have no hesitation in announcing Mr. Skidmore's popular work, as revised and enlarged, the most complete, reliable, and useful Manual of Mineral Law extant. It contains many features not found in other works, such as the Rules of Practice established by the Department of the Interior, the Coal and Saline Acts, the Timber Regulations, and Digest of the most recent and important Judicial Decisions. The ordinary Forms of Incorporation and Conveyancing of Mining Claims in use in California have been added, and a full index renders the various matters easy of reference.

The Digest gives the dates of the decisions and reference to the periodicals and works in which they may be found, and the introduction of index words and phrases in capitals and bold-faced letters renders it easy to find at once the particular information needed.

Mr. Week's Commentaries is a more elaborate work, a treatise for the lawyer, but even to those of the legal profession who have that work, this will be a convenient and valuable hand-book.

Mr. Skidmore seems determined to retain the enviable reputation established for his work as the most complete and reliable

Manual of Mining Law.

It is beautifully printed upon the best paper; contains 140 closely and closely printed octavo pages, and is published at the low prices of \$1 in pamphlet and \$1.50 in law sheep binding.

Mail, post-paid on receipt of price.

SUMNER WHITNEY & CO.,

PATENTS AND INVENTIONS.

List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch from Washington, D. C.

WEEK ENDING JANUARY 22D.

TOBACCO DRYING MACHINE.—W. B. Isaacs, S. F.
WHIP-SOCKET.—A. H. Law, S. F.

ADJUSTABLE STIFF CRUTCHER FOR HARNESS.—
J. C. McCollum, Los Angeles, Cal.

HIGH AND LOW WATER INDICATOR FOR STEAM
BOILERS.—A. W. Vanderstou, Salem, Oregon.

TRADE-MARK.

LEMONADE-POWDERS.—J. A. Folger & Co., S. F.

TEAS.—J. A. Folger & Co., S. F.

TEAS.—J. A. Folger & Co., S. F.

TEAS.—J. A. Folger & Co., S. F.

LABELS.

SYLVESTER'S CURE FOR NEURALGIA AND DIPH-
THERIA.—Sylvester & Dunn, San Jose, Cal.

—The patents are not ready for delivery by the Patent
Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished
by DEWEY & CO., in the shortest time possible (by tel-
graph or otherwise) at the lowest rates. All patent in-
quiries for Pacific Coast inventors transacted with perfect
security and in the shortest possible time.

The Rainfall.

We seize the opportunity to compare the
figure of the rainfall this season and last, up
to the dates named, at the different points in
the State. There have been two other rains,
which are not caught in the figures above, except
in San Francisco. In arranging the table we have
taken a course from San Francisco northward,
around the head of the bay, then to the Sacra-
mento valley, thence up the San Joaquin, and
return along the coast and coast valleys to the
starting point. It will be seen that the contrast
shows favors from twice to thrice as great as
last season, and it must be remembered that a
good part of last year's rain fell in October and
was of little value. This year the great amount
comes in January and will be all made to con-
tribute to the prosperity of the State and the
comfort of our citizens:

San Francisco, Feb. 6.	18.77	Last year.	8.67

FLOOD AT SACRAMENTO.—As we write, on
Thursday, a large region of country adjacent
to Sacramento is under water and a great loss of
agricultural property will be occasioned. Re-
ports say that the levee on the east bank of the
Sacramento, a mile and a half below the city
broke at 3 o'clock Tuesday morning on Flint's
ranch. This has been for years a weak place,
but a new levee was constructed and a wing
dam put in last summer to keep off the current.
The water Tuesday morning broke in the new
soil. This break will flood all the land be-
tween the river and high land on the east for 20
miles down. One account says: It is impossible
to correctly estimate the damage already done,
but it may safely be said that it will reach at
the least half a million of dollars. The country
overlaid contains the vegetable gardens from
which the city derived its supply; also a large
portion of the slaughter-houses, cattle ranches,
feed yards in connection therewith, many sub-
stantial mansions and at least 1,000 small homes.
It was also a favorite location for hop yards
and nursery gardens, all of which have been
ruined. It is feared that a large number of cat-
tle have been drowned and large fields of well-
advanced crops inevitably damaged.

MINERS who wish to be posted on the mining
laws and decisions of the Commissioners should
purchase "Copp's Hand Book of Mining Laws."
It gives everything relating to the subject so
plainly that a miner need consult no lawyer for
advice on many propositions. There is a digest
of all the important rulings of the Land Office.
Price, \$1. For sale by Dewey & Co., 202 San-
some street, S. F.

Cost of Refining and Shipping Crude Bullion.

In conversation with a gentleman yesterday,
who is posted on all of the ins and outs of the
cost of refining and shipping crude bullion, we
were furnished with the following figures: The
freight on a ton of crude bullion from Eureka to
Pahsade is \$11.50; from thence to Ogden, \$17,
and from that point to the refinery at Newark,
N. J., \$31; the latter being in currency and the
two former in gold, making the total freight
rates \$59.50. The cost of separating and refining,
including a deduction of 12% for dross, is
\$23.50, which makes the total cost per ton \$82.
The discount on the silver is a still further in-
crease, and brings it to \$85, the price at which
lead is ruling in the New York market. The
product of base ores vary considerably, and it
will take from 3 1/2 to 5 tons of ore to produce
one ton of crude bullion. This bullion varies
in value according to the richness of the ores,
and will run from \$260 to over \$300 per ton,
and in some instances much higher, as in the
case of the output of the Matamoros furnace,
which, during its last run, turned out bullion
valued at \$400 per ton. This is exceptional,
however, and the great bulk produced will prob-
ably average \$280. It has been calculated that
the cost of raising and reducing a ton of ore is
\$35 per ton, which would make the cost of a
ton of bullion reach \$140. Granting that a ton
of the crude bullion contains gold and silver to
the amount of \$280 and that the refined lead
will pay separating and refining expenses, we
have a net profit of \$140 per ton.

In order to verify the above showing, we
were permitted to run over the books of
one of our largest companies, and found that it
was almost correct, their returns showing a net
profit of \$139.31 per ton on a six months' yield
of over 7,000 tons of bullion. It will be seen
by the above that the working expenses,
freights, discounts, etc., consume half of the
gross yield, and that ore assaying under \$35 per
ton will not pay to extract and smelt. There
are thousands of tons of low grade ore in the
district that await the advent of some cheap
concentrating process, which, if ever introduced,
will add materially to the resources and yield
of Eureka district.—Sentinel.

PROTECTION OF THE COLUMBIA SALMON.—
A bill, which has lately been introduced in
Congress by Senator Mitchell, prohibits the
taking of salmon in the Columbia river and
tributaries, by any means whatever, between
July 26th, and October 1st, of each year, and
impose penalties of at least \$1,000 fine for the
first offence, and \$1,500 fine and 12 months'
imprisonment for subsequent offences. Minute
regulations are prescribed concerning the tak-
ing by gill-nets, seines, weirs and traps be-
tween April 1st, and July 26th, and similar
heavy penalties are imposed for a violation.
The bill also prohibits throwing into the stream
saw-dust from the mills or waste liquids from
factories, tanneries, etc., between July 1st, and
December 31st, of each year, under penalty of
\$500 for each offence. One-half of the fines are
to be paid to informers and the rest devoted to
the propagation and preservation of fish under
direction of the Commissioner of fisheries.

DRIED PERSIMMONS.—Mr. Loomis showed us,
the other day, a box of dried persimmons just
received from Japan. They were of the Imperi-
cal or oblong variety, and when dried and
pressed made a fruit about three inches in
length, one and one-half inches in width, and
three-quarters of an inch thick. They were
packed with exceeding neatness in a box hold-
ing 50 of them. The box had a slatted bottom,
and there was a layer of coarse straw beneath
the fruit and between the layers. The cover
was raised above the fruit to admit the air.
These precautions are found necessary to pre-
vent the fruit from molding. The flavor is fine,
and taken with the handsome appearance, will
make dried persimmons a favorite article in the
market. They were dried without the addition
of sugar, and yet they were coated with a bright
coat of oil derived from their own juices.

THE ECONOMY HYDRAULIC HOIST FOR STOKES,

And General Machinists.

Buy the Best.

Before purchasing an American Watch, examine the different styles manufactured by the HAMPDEN WATCH COMPANY, at Springfield, Mass. They are the latest and best improved manufacture. You can depend upon them for fine finish, durability and perfect time. They are sold at favorable prices—in fact, no higher than many of the inferior styles. Examine into the merits of this Watch before you buy any other. Our word for it, you will not regret it.

DEWEY & JORDAN, Agents,

433 Montgomery St., S. F.

Peerless Corn Sheller.

It is so cheap (costing only \$6), that almost any one can afford to buy one. It is so rapid, it will shell almost as fast as a \$40 machine, and seven or eight bushels per hour is not above its capacity. It weighs only 13 pounds and is simple and durable. For particulars, address

WEISTER & CO.

17 New Montgomery St., S. F.

A JOB PRESS WANTED.

Any printer having an Eighth or Quarter Medium Job Press for sale, will please address J. P., care of Dewey & Co., S. F. State condition and lowest price.

FINE RANCH FOR SALE.

LOWEST PRICE, \$8,000.

The ranch is situated on the direct stage road between Mendocino City and Cloverdale, in Mendocino County. Forty miles from Cloverdale, 20 miles from Navarro Ridge and one mile from the Christine Postoffice.

It Consists of a Total of 2,000 Acres, of which 640 are secured by Government title and the balance by possessory title. It consists of

150 Acres of Rich Bottom Land, which is adapted to the raising of Wheat, Barley, Oats, Potatoes, Corn, Vegetables, etc., and will raise as large crops as any land in the county. There is 1,210 acres of Fine Rolling Land which is a No. 1 pasture land, and capable of keeping 1,000 head of Sheep, or 100 Dairy Cows. The whole ranch is well fenced with picket and post and rail fence, and has eight good buildings on it, consisting of a good substantial and comfortable

Dwelling House of Six Rooms,

Two Barns, one of them 100x40 feet, and the other 40x40 feet, a Granary, Woodshed, Chicken House, and a No. 1 Dairy House, now last year. There is a bounteous and never failing supply of good soft water at both the Dwelling and Dairy Houses.

On the ranch is a large quantity of Rodwood timber, suitable for all purposes. There is a

Fine Orchard of Some 300 Trees,

Of the choicest varieties of Peach, Apple, Pear and Plum, as well as a large quantity of Grapevines, Currant and Gooseberry bushes, and other small fruit. There is 100 acres sown to Wheat and Barley, which is now up four or five inches, and promises an abundant harvest in the fall.

The owner has also about 40 head of Cattle, a few Sheep, five horses, 150 head of hogs, 100 Hens, and a large supply of all necessary Farming Utensils, which he will dispose of to the purchaser at very reasonable terms if desired.

The neighborhood is as good as could be desired, only one mile from a store and one-half mile to a good schoolhouse, as well as one-half mile from a church.

The owner's reasons for selling are his wife's health and his dislike of the business. At the price at which it is offered it is the cheapest ranch in Mendocino County, as the crop bids fair to be worth when harvested, \$4,000.

Terms are \$3,000, one-half cash and the balance secured by a mortgage at one per cent. For full information, address

DEWEY & CO., 202 Sansome Street,
SAN FRANCISCO, CAL.

QUARTZ MILL AND MINE FOR SALE.

The Quartz Mine situated on Humbag Creek, Siskiyou County, Cal., known as the New Eliza Mine, together with a

REGISTER YOUR
TRADE
MARKS.

The U. S. Government now offers greater protection than formerly to manufacturers under the law of Trade Marks.
Those who manufacture a superior article, or put up improved packages of merchandise, should protect themselves from imitations by registering their Trade Marks.
We have special facilities for securing full rights by the registration of Trade Marks, and our terms are very reasonable.
Consultations free. Many dealers have missed fortunes from not being fully informed and protecting themselves in their rights.

PATENTS obtained promptly: Caveats filed expeditiously Patent re-issues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Soliciting Business promptly and thoroughly conducted. Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons, and our success and business are constantly increasing. The shrewdest and most experienced inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

From A. Patentee.

HUNSAKER, TULARE CO., CAL., Jan. 15, 1878.

You will now receive my grateful, heartfelt thanks for the able manner in which you have conducted the interest entrusted to you by me. Your acknowledged ability, confirmed to me as it is by the successful presentation of my claim for a patent on a pump power, not only delights me, but suggests the propriety of my continued patronage and that of all my friends. With kind wishes for your future success, I subscribe myself, yours respectfully,

A. L. HUNSAKER.

TO QUERISTS.

In propounding questions to the editorial, patent or business departments of this office, letter writers should be careful to enclose a stamp and addressed envelope if they wish prompt answer. If we were to furnish time, paper, envelopes and stamps, all free to parties who address this office on matters of more interest to themselves than to us, FIVE HUNDRED DOLLARS A YEAR would not cover the expense. This hint, however, is not intended for parties writing in our own or the public interest, or who would be obliged to delay writing at any time for want of an extra stamp.

SCIENTIFIC PRESS.—As the old year is drawing to a close and the new is rapidly approaching, all our mining friends should subscribe for this scientific journal, especially devoted to their interests. It is a California enterprise, and compares favorably with similar organs of years more experience and age in the old countries.—*Golfax Enterprise.*

The Large Circulation of the MINING AND SCIENTIFIC PRESS extends throughout the mining districts of California, Nevada, Utah, Colorado, Arizona, Idaho, Montana, British Columbia, and to other parts of North and South America. Established in 1860, it has long been the leading Mining Journal of the continent, its varied and reliable contents giving it a character popular with both its reading and advertising patrons.

This paper is printed with Ink furnished by Chas. Eneu Johnson & Co., 509 South 10th St., Philadelphia, & 59 Gold St., Cor. Ann, N.Y.

Amusements.

Fancy Mining Companies.

The people of this coast have from time to time been "hitten" by buying interests in companies which proposed making money out of mining property in some very rapid way other than legitimate work. These gilt-edged companies are played out among us, however, and no matter how alluring a prospectus may be gotten up our people are too wary to be caught with chaff. Since the success of the bonanza mines the Eastern public have commenced to take an interest in mining matters here, and it is considered a good time for sharpers to put their schemes before them. Those who are unfamiliar with mining matters are apt to easily be fooled by fancy assays, fancy prospectuses and fanciful profits. It is the duty of all who have the real interests of the country at heart, to expose any such frauds as soon as possible, so that the unsuspecting may be put on their guard.

A case in point has just been brought to our notice. The Rocky Mountain Prospecting and Mining Co., issued a prospectus in the N. Y. Mining Record which would probably take with a great many people. It is as follows:

"Five hundred dollars, or one hundred dollars annually, for five years, will secure you through this company, one-half interest in either a gold, silver or copper mine, for which you would have to pay many thousands of dollars.

"W. H. Holmes, deputy U. S. surveyor and mineralogist and E. A. Egglestone, both veteran prospectors and successful locators of rich mines are exclusively devoted to prospecting of this company, in which they are largely interested. A valuable mine of precious ore is guaranteed in every instance.

"Twenty-two silver and gold mines are included in the property of this company. These are under process of development. The company's capital is \$250,000 in 2,500 shares of \$100 each, all of which are pledged as guarantee of security to those who order mines located.

"Parties ordering can take a one-half mine by paying the annual assessment of \$100; one-fourth by paying annually \$50; or a one-eighth by paying annually \$25. The company will pay for the work, recording, surveying and superintend all work, so that it is executed scientifically and economically. Parties may form clubs and order one or more mines. Exchanges made for desirable property. Satisfactory reference given as to competence and responsibility. Address, enclosing stamps, Rocky Mountain Prospecting and Mining Co."

Guaranteeing a valuable mine of precious ore is pretty good, and the idea of buying one-half or one-quarter or one-eighth of a mine for \$100 or \$50 or \$25 and leaving the company to pay for the work is better. Any mining man will see how nonsensical the whole thing is and what a pretty scheme was devised for raking the hoarded dollars of the Eastern folks who wanted to be bonanza kings. Unfortunately, however, for the projectors, the Surveyor General of Colorado comes to the front and says Holmes is not a deputy mineral surveyor, and the citizens of the town of Rosita, Colorado, come out in a card and denounce the whole scheme as a fraud. This card, which is published in an extra of the Rosita Index, is as follows:

"We, the undersigned, citizens of Custer, county, mine owners or otherwise interested in Custer county, Colorado, having its welfare at heart and not wishing to be considered as parties to any scheme or schemes fraudulent and not in accordance with the truths and facts in the case, declare hereby that all communications issued from Custer county, by one E. A. Egglestone, alias H. H. Horton, alias C. D. Crestone, alias Coronado, Rosa, Crusado, Trap-Rock, or under any other alias, are mostly fabrications of his own fertile and fraudulent brain, based upon air castles built by his imagination, intended to catch and deceive the unwary and innocent for the purpose of obtaining money by such overdrawn pictures and false representations. The above Rocky Mountain Prospecting and mining company, in our estimation, is a swindle, gotten up by said E. A. Egglestone and W. H. Holmes. To our knowledge, they have not 22 paying mines nor mines at all, and

both these men could not probably muster 250 cents between them. They have and do locate holes all over the district, and call them mines, and we, the undersigned, do hereby disavow and discountenance such proceedings as wrong and fraudulent and detrimental to the fair interests of Custer county. We ask respectfully for the publication of the above for the benefit of mankind."

We are very glad to be able to record an instance of this character, and must give the citizens of Rosita credit for having more backbone and sense than is usual. We are sorry to say that here, as elsewhere, hundreds of similar schemes, known to be fraudulent, have been floated, when they were known at home to be such. Yet the people of the camps in which they were inaugurated took no steps to prevent innocent persons from being victimized. The card given above is signed by over 60 citizens of Rosita, including the *bona fide* Mineral Surveyor—Mr. Wulsten, the postmaster, Justice of the Peace, County Treasurer, member of the Legislature, County Judge, President of the Town Board, cashier of the county bank, the County School Superintendent, the editor of the Index, the Town Clerk, a number of merchants, mine owners, and others.

This ought to explode the whole scheme, and probably has done so, and we have spoken thus

A TWO-HEADED SNAKE FOUND IN SANTA CLARA COUNTY.

at length on the subject so as to set an example to others in similar instances. If mining men in any camp, when they see any fraudulent scheme advertised, would immediately denounce the whole transaction, as the citizens of Rosita have done, such things would occur less frequently. This would tend greatly to purify the moral atmosphere surrounding our mining interests, and prevent innocent people from losing their money and sharpers from getting it.

CARIBOO.—A dispatch from Victoria relative to the Cariboo mines, says: Cooper, who located the Cooper claim on the Bonanza ledge, at an expense of \$48.50, has sold out to a company for \$6,000 cash. Labor is already scarce at Cariboo, as every man there either already own a claim or is engaged in the endeavor to discover one. Several companies are already doing good work. The St. Laurentz and American are driving a tunnel on their claim. A company known as the Lord and Lady Dufferin are reported to have struck a ledge crossing Grouse creek, and ledges have been traced as far as Antler.

THE CON. VIRGINIA AND CALIFORNIA mining companies have made applications for patents under the provisions of the Act of May 10th, 1872, and due notice thereof is given by publication according to law. The first named company claims 711.27 linear feet of the Comstock lode, with surface ground of the width of 1,442.66 feet, and the latter 350.60 linear feet, with surface ground 1445.64 feet in width.

Woodville Con. vs. Woodville.

The Woodville Consolidated Silver Mining Company has brought suit in the Fourth District Court against the Woodville Gold and Silver Mining Company—G. D. Roberts, G. W. Kidd, S. F. Gasbiller, C. F. McDermott, Charles Kaufman and John W. Pearson—to recover possession of 57,400 shares of the stock of the defendant company, and also of 2,600 shares of the stock from the defendant Pearson; also for an injunction to restrain the defendants from issuing, transferring or in any manner disposing of any shares of the capital stock of the defendant company, and likewise from levying an assessment on the stock or selling any of it by virtue of delinquency. The suit is based on an alleged agreement entered into in January, 1875, by which the plaintiff undertook and agreed to issue and deliver 60,000 shares of the capital stock of the plaintiff to the defendant company in the following manner: For every share of the capital stock of the defendant presented and surrendered to the plaintiff one share of the capital stock of the plaintiff, and so on until 60,000 shares should be issued and delivered, and the plaintiff further undertook and

agreed to accept and discharge fully all the obligations and liabilities of the defendant company, which on its part agreed to forthwith execute and deliver to the plaintiff a conveyance of certain mining ground and property situated in Storey county, Nevada. In compliance with the agreement the plaintiff delivered to the defendant 57,400 shares of its capital stock, and the defendant executed the conveyance referred to. The remaining 2,600 shares were not presented to the plaintiff because the holders were not known, but the plaintiff transferred on its part its corresponding number of shares to Pearson in trust. Plaintiff next avers that Pearson, who was President of the defendant company, caused the entry of the adoption of the resolution authorizing the execution of the conveyance in question to be torn from the record book of the company, so that the conveyance became of doubtful authenticity—in fact, gave no legal title to the property. Plaintiff, therefore, alleges that its shares were obtained fraudulently, and brings suit to obtain redress.

LEAD.—The Selby smelting works, of San Francisco, produced, in 1877, 5,912 tons of pig lead. Of this, 499 tons were exported to China, 2,797 to New York, and consumed there 2,616 tons at their shot tower works. The price of pig lead in San Francisco is 5@5½; sheet lead, 9c; bar lead, 6½. The Richmond Consolidated mine produced, in 1877, 5,200 tons of pig lead. During 1878 it is expected that the lead product of the Eureka mine will be shipped to that city.

A Very Wonderful Freak of Nature.

A Perfect and Lively Two-Headed Snake.

[Written for the Press by J. W. A. WRIGHT.]

All students of natural history and anatomy, and everyone whose attention is arrested by the wonderful works of nature, can but take interest in the subject of this sketch, and the very truthful likenesses herewith, the photograph and engraving for which, of life size, were prepared in the office of the Press, with no little trouble, from the living and rather too active freak, which we propose to describe in brief. A real two-headed snake, healthy, living, and handsome as any snake can well be, and no mistake, no Barnum-like trick about it! This *lusus nature*, so successfully represented by your artists, was found November 27th, upon the line of the narrow gauge railroad now being constructed between San Jose and Santa Cruz, at Los Gatos, Santa Clara county, near the foot hills of Santa Cruz mountains. It was discovered under a stick of fir wood by a Mr. Connelly and Mr. J. W. Linden, and is now the property of the latter gentleman, with whom Mr. Woodward, of our noted pleasure gardens, was negotiating for its purchase. Should it live and thrive, it will be one of the greatest curiosities ever introduced into his extensive and instructive collection. Mr. W. E. Livermore had charge of his snake-ship in this city a week after his capture, and through his courtesy the likenesses and facts here presented were obtained.

A careful examination indicates that it is a young specimen of the familiar species known as the bull-snake, pine-snake, or, more commonly in this State, the gopher-snake (*Pituophis Wilkesi*), our Pacific coast species. It supplies here the place of the chicken-snakes, so common as house-snakes east of the Mississippi river (*Ophibolus eximius* north of the 37th parallel and *Scotophis quadrivittatus* south of that line), and feeds upon gopher rats, other small animals and birds. It is a harmless snake, we having no poisonous one in California but the rattlesnake. This two-headed one is 22 inches long, of uncertain age, but perhaps only a few months old, since full-grown ones attain a length of from six to seven feet. Its ground color is a dingy, yellowish-white, with a dorsal row of chestnut-brown spots, nearly square and 75 in number, from the point where the two necks separate, extending its full length. On each side are two lateral rows of smaller spots of similar form and color. It has on each head the two sets of occipital plates, which help to distinguish its species, one set of three, of nearly equal size, in a row between the eyes. There are two additional dorsal spots on each neck, above the point of division. From the point, where the crotch formed by the two necks begins, to the tip of each snout is about an inch and a half. The two heads and necks are entirely separated for nearly an inch. Both heads and necks appear perfect and entirely symmetrical in every way. Each head has two good eyes, equally large and full. It can shoot out each forked tongue together or one by one. The two perfect mouths open into one throat. Each neck is equally flexible and the movement of each head is perfectly easy and natural. The two heads can be placed closely side by side, or one above the other and even crossed or spread widely apart at will, as is shown in the figure engraved.

Each seems to have equal power, and to be alike subject to separate control and motion. It eats and drinks equally well with either mouth. One can but think it would have a serious time, when it gets larger, if each head should ever attempt to swallow the same gopher at once.

Can any one tell us of other instances of such a double-headed reptile, as California has now certainly produced in this snake? The myths of old about hydras, etc., are excluded from the competition.

SPECIMENS.—We have received a specimen of silver-bearing rock from the Excelsior mine, Copper City, Shasta county, contributed by Mrs. B. F. Frank, of Reading. The ledge is 14 feet wide in places. We have also received an undetermined specimen from a mine in the same vicinity.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EHS.

The Mokelumne Ditch and Irrigation Co.'s Dam.

EDITORS PRESS:—Thinking that the progress of an enterprise which has for its object the irrigation of 300,000 acres of the best land in the rich county of San Joaquin may be interesting to many, I last Saturday rode up to the point in the Mokelumne river where the company's dam is in process of construction. My self-imposed task was a very pleasant one. The recent timely rains had given the air the agreeable softness of spring, and the upspringing grain with delicate shade of green was making the most of present opportunities. The way led from the pleasant town of Lockeford through a beautiful, undulating country in view of some of the choicest bottom land of the Mokelumne, leading toward the end of my ride, through some rough foothill land of Calaveras county, and in the midst of worked out and abandoned mining claims. In this part of the route the aforementioned spring air was blended with a foreign air, lent by the Mongolian visage of cheap labor employed on its own account with cradle and rocker in extracting the root of all evil from neighboring gulches. The results are to them pecuniary, and to outside "barbarians" didactic. The yield is six bits per day for each man, and the lesson taught is viz: Never cease to endeavor and to labor even in seasons when the compensation is small.

Thirteen miles east from Lockeford I reached the dam, which is 29 miles distant from Stockton. The site is near Lancha Plana (flat boat), a place which in its best days, following the discovery of gold on Winter's bar in 1852, polled 350 votes. After taking out many hundred thousand dollars, the miners sought fresh fields and pastures new, and the town-to-day numbers less than 100. The dam is located in the Mokelumne between Westmoreland's bridge and Winter's bar, at a point where the river narrows between bluffs rising 40 feet above its bed.

G. C. Holman, a civil engineer, residing near Lockeford, made his first survey and handed in his report March 17th, 1877. The dam is built after specifications drawn by Mr. Holman, though they have since been modified in some particulars. Mr. Holman is chief engineer and has charge of the construction of the headworks and canals. Work upon the dam commenced October 18th, 1877, under the supervision of Engineer Cravens, of San Francisco, and is now being conducted under the direction of Mr. Wallace, of Stockton. Sixty-five men were at first employed, and 47 are at present engaged in its construction.

A coffer dam was built and an excavation made in the bed of the river 56 feet in width, 7 feet depth on one side and 18 feet on the other, the whole filled with broken rock laid in cement, forming a solid foundation. The dam is 270 feet in length, abutting on either side on a solid rock formation, giving it additional strength and security. Its height will be 25 feet and its width on top eight feet. The slope on the inside is 14 inches horizontal to one foot rise, and on the outside nine inches horizontal to one foot rise. The dam is built of stone and is to be capped with timber sills and faced with plank. The sills will be secured with iron rods to girders laid under a course of stone. The dam is built with a course of stone laid in cement in the center to prevent percolation of water, and the inside will silt up with the wash of the river.

The rock used in building is quarried out of solid rock near each end of the dam, and is a heavy blue granite mixed with quartz and weighs 175 pounds per cubic foot. It is blasted out in blocks weighing from 500 pounds to 4½ tons, and is laid in course without dressing, filling in with small stones or broken rock. The weight of the dam when completed is estimated at 7,000 tons, or 14,000,000 pounds.

Under the articles of incorporation, the company claim 100,000 inches of water, miners' measurement, which is equivalent to a flow of 1,965 cubic feet per second. At times of high freshets the river is said to run 1,000,000 inches of water, or 19,650 cubic feet per second. When we reflect upon the immense pressure this volume of water, flowing in a channel less than 300 feet in width, must bring to bear on all obstacles, and know also that 300,000 feet of logs lie in the bed of the river above, which, in the event of a sudden freshet would ride swift upon the flood threatening all before it, over-rending, crushing and grinding in their mad career all that may oppose, we may form some idea of the strength required in a work of this kind to successfully withstand the force that may be launched against it. The work was planned by competent engineers and is undoubtedly strong enough to meet its requirements. The dam is but two-thirds completed and should be finished as rapidly as possible to escape the disastrous effects of an early rise.

H. EUGENE H.

Woodbridge, Jan. 23d.

The New Mining Bill.

The Method Proposed to Stop Swindling in Mining Stock Transactions.

The following bill was introduced in the California Assembly last week by Mr. Tuttle, who said he did so by request. It is understood that this bill is an administrative measure, and is drawn in conformity with the views and promises made by Governor Irwin in his last message:

An Act to encourage the mining industry and to suppress stock gambling.
The People of the State of California, represented in Senate and Assembly, do enact as follows:

SECTION 1. It shall be the duty of the Governor, within 30 days after the passage of this Act, to appoint a Mining Commissioner for the term of four years, who shall, within 10 days after his appointment, qualify and execute an official bond in the sum of \$50,000, to be approved by the Governor and Attorney-General, and filed in the office of the Secretary of State. No person shall be eligible to the office of Mining Commissioner who is an officer, agent, employee or stockholder in any mining corporation, or who is in any way connected with any hoard or association of stock brokers; and if at any time after his appointment he shall become such, it shall be the duty of the Governor, upon ascertaining the fact, to remove him and appoint a successor.

The Commissioner's Office.

SEC. 2. The Mining Commissioner shall keep his office in the city and county of San Francisco, and it shall be open during every business day throughout the year, from 9 A. M. until 5 P. M. The records of the office shall be accessible to the public during business hours, and the Commissioner must provide a convenient and conspicuous place for exhibiting to the public the information obtained by him from the mining companies as hereinafter provided.

Blank Forms to be Furnished.

SEC. 3. As soon as possible after his appointment, the Commissioner must prepare and furnish to all the mining corporations organized under the laws of this State, or doing business in this State, blank forms with instructions to fill them out in accordance with the provisions of this Act, and return them to his office at the times hereinafter specified; and he may make such changes from time to time in the form of such blanks as may seem to him best adapted to elicit the information required to be furnished by this Act.

Notice in Writing.

SEC. 4. For the purpose of enabling the Commissioner to comply with the preceding section, the Secretary of State shall, upon the application of the Commissioner, furnish to him a complete list of all mining corporations organized under the laws of the State, stating also the place named in the articles of incorporation as the principal place of business of each corporation. And it shall be the duty of each corporation engaged in mining in this State, or organized under the laws of this State for the purpose of mining elsewhere, to give the Commissioner notice in writing of the address of the President and Secretary thereof.

Bond to be Filed.

SEC. 5. The Commissioner must require every corporation not incorporated under the laws of this State, but engaged in or proposing to engage in the business of mining in this State, before commencing such business, or if already so engaged, then immediately to file in his office a bond to be signed by an officer of the corporation, with two good and sufficient sureties, to be approved by the Commissioner, in the penal sum of \$10,000, hindering the corporation to conform to all the provisions of this Act.

Copies of Articles of Incorporation.

SEC. 6. The Commissioner must require every corporation engaged in mining in this State, and every mining corporation formed under the laws of this State, to file in his office as follows:

1. If incorporated under the laws of this State, a copy of the articles of incorporation and statement of any increase or diminution of the capital stock, certified by the Secretary of State to be a copy of that which is filed in his office; or, if incorporated under the laws of any other State or country, a copy of the articles of incorporation, charter, deed of settlement, or other document under which the organization was formed, duly certified by the officer having the custody of such articles of incorporation or other document. Such copy of articles of incorporation or other document, must be furnished at once upon demand of the Commissioner.

Weekly Reports.

2. A weekly report by each corporation, to be made every Saturday; provided, that if any corporation should desire to make its report on a different day of the week, it may do so with the consent of the Commissioner. The report shall be duly verified by the oath of some officer of the corporation, giving a full and accurate account of all explorations in the mine under the control of the corporation during the week preceding; stating the length of tunnels, drifts or crosscuts run; winzes, shafts or other excavations sunk; borings with the diamond drill, and all other explorations in and about the mine, together with a statement of the highest and lowest assays, total number of assays made, and the fair average thereof; and also a state-

ment of the location and a description of all ore bodies encountered in the prospecting operations of the week. The report shall also state the number of tons of ore extracted during the week, the number of tons reduced, the value of the bullion shipped and remaining on hand, and such other information as may be from time to time required to be given by the Commissioner as of importance to the stockholders or to the general public. And if, during the interval of making said weekly reports, any important discovery should be made, materially affecting the value or the prospects of the mine, or if there should be a serious caving or flooding of the mine, the same shall be reported at once to the Commissioner.

Monthly Reports.

3. A monthly report by each corporation, duly verified by the oath of an officer thereof, showing the actual financial condition of the company at the close of each fiscal month, the receipts and from what sources, the disbursements and for what purpose, the number of tons of ore extracted, the number of tons of ore reduced, the value of the bullion product for the month, the amount of the assessments levied or collected, the balance of cash on hand, the amount of the indebtedness, if any. Also, an inventory of the property belonging to the corporation and its cash value.

Estimate of Expenses.

4. An estimate, duly verified by the oath of an officer of the corporation, of the expenses for each quarter, to be prepared and filed in the office of the Commissioner at the beginning of the quarter, stating the probable amount of money required to conduct the operations of the company during the next quarter, and for what purposes, and whether it will be necessary to levy an assessment, and the amount thereof. If the corporation shall at any time determine to change its plans so as to require an additional amount of money, exceeding the sum of \$10,000, the fact and the amount that will probably be required shall be at once reported to the Commissioner.

Annual Reports.

5. A copy of the annual reports of the corporation, duly verified by the oath of an officer thereof, to be accompanied by a complete map of all explorations in the mine, and tables of statistics showing the product, receipts and disbursements in detail during the year.

Verified Copies.

6. A copy of all the annual reports of the corporation since the date of organization; or if such copies or any of them cannot be furnished by reason of the loss of records, the fact of the loss and the cause thereof must be stated by a report duly verified by the oath of an officer of the corporation.

Other Papers.

7. Any other report or paper relative to the business or property of the corporation which the Commissioner may deem essential to the accomplishment of the purposes of this Act.

Penalties for Refusing to Make Reports.

SEC. 7. Any corporation which shall neglect or refuse to make the reports and estimates herein required, or any of them, or shall refuse to admit any person authorized by the Commissioner to inspect the mine or books of the corporation, shall forfeit a sum not less than \$1,000 nor more than \$100,000 for each and every such offense, and it shall be the duty of the Commissioner to institute proceedings forthwith in any Court of competent jurisdiction for the collection of the same. In case judgment shall be recovered in such proceedings, if neither the corporation nor the stockholders are able to satisfy the judgment rendered, the Commissioner shall immediately institute proceedings to disincorporate the company.

Penalty for False Reports.

SEC. 8. Any corporation which shall make a false report upon any matter herein specified to be reported upon, shall be subject to the penalty prescribed in the preceding section. In addition, the corporation and the officers thereof shall be jointly and severally liable for any loss that may be sustained by any person by reason of such false report, to be recovered in a civil action, as in other cases.

Stockholders May Call for Investigations.

SEC. 9. If at any time the Commissioner has cause to believe that a report of operations in or about a mine is not substantially true, or that the financial report of a corporation is not correct, he shall appoint a competent expert to visit the mine, or to inspect the books and papers of the corporation, requiring him to make a thorough investigation, and submit a report, duly verified by oath, stating the facts found by him. Upon the written application of any stockholder, who will deposit the money necessary to defray the expenses, he shall appoint an expert to make such investigation and submit such a report. Should the report of the expert show that the report of the corporation was false in any essential respect, the corporation shall forthwith be proceeded against by the Commissioner, as provided in section 7 of this Act. The money deposited to defray the expenses of the investigation shall, if a judgment be obtained against the corporation, be returned to the party or parties making such deposit.

Information from Individuals.

SEC. 10. In addition to the reports required from mining corporations it shall be the duty of the Commissioner to obtain all the information he can from individuals and firms engaged in the business of mining in this State. For that

purpose he shall distribute proper blank forms to them, and request them to furnish annually a statement showing the location of their mines; whether quartz or gravel mines; the total yield; manner and cost of working the gravel mines; the width of quartz veins; depth and extent of explorations; yield in tons of ore, and value of bullion; cost of mining in detail; cost of reducing ores, and all other expenses; amount of profits and loss; future prospects of the mines; means and cost of transporting supplies, and such other information concerning the mining industry as may be of general interest.

Annual Report to the Governor.

SEC. 11. The Mining Commissioner shall annually submit to the Governor a concise and careful report for the year ending June 30th upon the condition and prospects of the mining industry of the State, accompanied by a full table of statistics from all the mines, so far as he is able to obtain them, including the mines outside of this State owned by corporations organized under the laws of this State.

Unlawful to Raise or Depress the Prices of Stocks.

SEC. 12. It shall be unlawful for any person to attempt to raise or depress the price of stocks by making or causing to be made wash, fictitious or fraudulent sales or purchases of stock. All transactions in stocks in which the seller is also the buyer, either in person or through others, are fraudulent and fictitious within the meaning of this Act.

About Officers.

SEC. 13. It shall be unlawful for any officer of a mining corporation to be pecuniarily interested, directly or indirectly, in any contract for the milling of ores, the furnishing of supplies, or the doing of any other business of the corporation.

No Stock to be Resold.

SEC. 14. It shall be unlawful for the Trustees or Directors of a mining corporation to resell any stock of the corporation that has been bought by the corporation on account of delinquent assessments. All stock purchased on such account shall be canceled and deducted from the capital stock of the corporation. And it shall be unlawful to mark any certificate of stock in any way whatever to indicate that an assessment duly levied has been paid, until the amount of such assessment has been actually paid in lawful money of the United States, and credited on the books of the corporation.

Penalties.

SEC. 15. Any violation of sections 12, 13 and 14 of this Act shall be punishable by imprisonment in the county jail for a term not less than six months, or in the State prison for a term not more than 10 years, or by a fine not less than \$500 nor more than \$10,000, or by both such fine and imprisonment; and the same penalty shall apply to any officer of a mining corporation who shall use his official position in any way to secure gains to himself or to any other person to the injury of any stockholder.

Name of Real Owner on Certificates.

SEC. 16. All certificates of the stock of mining corporations shall specify the name of the real owner thereof. If issued in the name of a Trustee, the certificate must also give the name of the beneficiary. All certificates of such stock issued in disregard of this section shall be void.

Record of Sales and Values.

SEC. 17. Every Board, Stock Exchange or association of brokers engaged in the business of buying and selling the shares of incorporated mining companies, shall cause to be kept a full and complete record of all purchases and sales of such shares made by the members of such Board, Exchange or association, showing the name of the buyer, the name of the seller, the number of shares bought and sold in each transaction, together with the name of the stock and the price per share agreed to be paid; and shall also cause a copy of the said record to be printed daily at the expense of the Board, Exchange or association of brokers, one of which printed copies, duly verified, shall be furnished to the Mining Commissioner, to be delivered on the day of publication, and one to the State Controller, to be mailed on the day of the date thereof. Each Board, Exchange or association of brokers shall also cause a written statement to be made at the end of each calendar month, or within five days thereafter, showing the total value of all the purchases and all the sales of each member of the Board, Exchange or association of brokers during the month, to be verified by the oath of an officer of the Board, Exchange or association, and filed in the office of the Mining Commissioner, a copy of the same to be transmitted by mail to the State Controller.

Statement of Sales.

SEC. 18. Every broker or firm of brokers engaged in the business of buying and selling the shares of incorporated mining companies shall, at the end of each calendar month, or within five days thereafter, submit to the Mining Commissioner a statement, duly verified under oath, upon a form to be furnished by the Commissioner, showing the full amount of his or their purchases and sales of said stocks, whether such transactions occurred at the sessions of a Stock Board, Exchange or association, or otherwise, stating separately the transactions in the Stock Board or Exchange and those made elsewhere. Upon filing said statement with the Commissioner, said broker or brokers shall pay over to the Commissioner one-half of one per centum of

MECHANICAL PROGRESS.

Hints for Testing Lathes.

Prof. Sweet remarks in the *Polytechnic Review* that it never does to assume the lathe centers are true, or that the lathe if set so as to turn absolutely parallel. To test the accuracy of the adjustment for turning parallel, first see that the live center is perfectly true. Put a properly centered bar of iron or steel in the lathe and turn a short distance at the foot stock end, opposite the dead center; reverse the bar in the lathe and set the point of a tool just so as to "tick" the turned place; then, without disturbing the tool, remove the piece and run the slide down until the tool comes to the next dead center; put the piece in the lathe as it originally was when turned, and if the lathe is set true, the point of the tool will "tick" the same as at the live center; if not, the foot-stock can be adjusted so it will "tick."

The following device suggests itself: A plain disc of metal, say 10 inches in diameter, and one-tenth of an inch thick, with a center hole one-sixteenth of an inch in diameter and straight through, when placed on the centers of a lathe, if the centers do not coincide, the error will be magnified 100-fold; and moving the centers so as to bring the disc in the plane of the face-plate, ought to produce an accurate adjustment.

In testing the accuracy of the main spindle of a lathe, set the two centers so as to coincide and grasp a piece of large gas pipe or a stick of wood, three or four feet long, in the lathe-chuck—when in motion strike with a lead pencil on the end of the wood, or a plug in the end of the gas pipe, a small circle; and when the dead center is brought up to this circle, it should, if the lathe is true, coincide with the center of the circle, or be slightly above it, as the gas pipe or wood would be slightly deflected by its own weight.

A NEW TYPE SETTING MACHINE.—Inventors are still in pursuit of machine type-setting and distributing. *Engineering* says that a new form of type-composing and distributing machine has just been placed on exhibition in London. The apparatus is the invention of Mr. Heinemann, and it consists mainly of a type frame or case, and a movable type-extractor carrying the composing stick. The case is fixed at an angle, and is divided into a number of vertical spaces for holding the various types. Below the case is a steel slide-bar upon which the extractor works, and is free to be moved either to the right or left by the compositor. The type extractor has two handles, one fixed on the left side, and by which it is moved to and fro, and the other movable on the right, by which process of extracting the types is performed. The operator adjusts the extractor to the letter required, in doing which he is guided by a graduated scale combined with the representation of the letters in each rack, the spaces on the scale corresponding to the letters. He then depresses the movable handle, which causes a small projecting piece at the back to engage in the space between the teeth of a steel comb, and which fixes the position of the extractor. At the same time a small piston advances forward, press a type before it out of the rack into the composing stick which is held in the receiver. On reversing the handle the type just pushed down the distance of its own thickness in the stick to make room for the next, the extractor is released, and is passed on to the next type required. When the composing stick is full, a spring is actuated by which a warning bell is rung. The full stick is then removed and an empty one substituted, the type being afterwards justified. There is also an arrangement for distributing the type.

THE ELECTRIC LIGHT IN A WORK SHOP.—On the 18th ult., says the *Railway World*, an experiment was made with the electric light in the Michigan Southern and Lake Shore railway shops in Cleveland. The shop in which the experiment was tried was 80x150 feet, filled with machinery, lumber, etc., and the ceiling and walls begrimed as is usual in such places. The whole was brilliantly illuminated by two electric lamps, one hung near each end. Each light was 2000-candle power, or equal to 125 gas burners of the usual size. The electricity was furnished by a three-horse Brush dynamo-electric machine. The cost was estimated as follows: Cost of three-horse power, estimated at one-half cent per horse power per hour, one and one-half cents; consumption of carbon in two lamps, three and one-half inches, seven cents; 10% per annum on cost of engine and machine, three and one-half cents; total cost per hour of light equal to 250 gas burners, 12 cents; 10 six-foot gas burners, gas at \$2 per thousand, cost 12 cents; relative expense 1 to 25. In addition to these advantages, the light is pure white, like sunlight, there is no danger in its use corresponding to defective or leaky gas pipes, and the amount of carbonic acid and other deleterious gases given off is asserted to be, compared to gas, as 1 to 200.

FIRE-PROOF BUILDING.—A few days since, says the *American Manufacturer*, while visiting the works of Wm. B. Seafie & Sons, of Pittsburgh, we were shown something of interest. They were desirous of making one of their floors between the first and second stories as nearly fire-proof as possible. The joists were of wood, and without sufficient protection could

readily burn. On the under side of the joists or ceiling was securely nailed well painted corrugated iron. The spaces between the joists were filled with a concrete of cinder and sand, and enriched with enough lime to set very solid. Over this was placed a thin layer of sand and a brick floor. Of course, if it had been desirable, a tile, marble, wood or any other kind of floor could have been used instead. With this improved floor a fire might burn for many hours in one story without communicating with the other, for the joists could at best only char or burn slowly from the edge. The improvement is especially applicable to all classes of stores and warehouses. The corrugated iron ceiling presents a fine appearance, and cannot be shaken off or cracked, like plastering, nor does it shrink, like ceilings covered with wood and strips. Any degree of ornamentation can be carried out that is desired. It does not prevent the use of cornices or moldings round the room next to the ceiling, and where center-pieces around gas lights or chandeliers are wanted they can easily be attached.

UTILISING WATER POWER TO COMPRESS AIR.—With a view to utilize water power by converting it into more manageable pneumatic power, Messrs. Swan and Hughes, of Farnby, England, have constructed an annular trough in which a weighted chamber, like a gasometer, floats in water or other liquid; within the annulus is a second covered chamber into which the water from the head is let; this water forces the air up through a valve into the floating chamber, raising the said chamber; when it has been raised to its full height the valve between the floating chamber and the central one is then automatically closed, and the air from the floating chamber is utilized for work. The water falling in the central chamber draws air by means of a pipe and valves from another chamber, in which is another similar weighted movable chamber, which by the partial vacuum formed is drawn up, and by its descent after gives out power by compressing air. Thus, while one chamber is filling, the other is giving out power. The annular trough should be kept full of liquid, but in some cases can be entirely dispensed with, the central chamber being immersed in the water, and a pipe with a valve on top being placed below it above the water line, syphons can take the place of the valves.

MANUFACTURE OF FERRO-MANGANESE IN FRANCE.—The Saint Louis iron works, near Marseilles, recently sent to the Paris Civil Engineers' Society, a specimen of its ferro-manganese, or, to speak more correctly, manganese pig. In 1862 the works began to make manganese pig, delivering to steelmakers in the Loire and Isere a white pig, called "facette" pig, which contained 3% to 6% manganese. In 1864 were adopted processes borrowed from those used in Siegen; and spiegeleisen, containing 9% to 10% of manganese, was made at a time when the manufacture of spiegeleisen, was elsewhere all but localized on the banks of the Rhine. The Saint Louis manganese pig now contains up to 85% manganese. The sample shown to the society was granular, or a gray, approaching the color of steel rather than that of gray or white pig. The reduction of manganese oxides is found not to be easy; the same furnace which would produce 50 to 60 tons per diem of steely gray pig, can only be made to produce 20 to 24 tons of alloys rich in manganese.

GLASS TYPE.—The *Toronto Globe* says that of the Bastie toughened glass not much has been heard lately, since its unreliability for lamp chimneys was proved by actual experience. A new and somewhat surprising use for it has been found in France in the manufacture of printing types. The glass is, of course, much cheaper than type metal, is harder, will take on a finer face, is more durable as respects fair wear and is stated to be less liable to damage than metal from the occurrence of such little accidents as the dropping upon it of mallets and "shooting-sticks." Not least among the many advantages claimed for glass type is that it can be cast in the matrices already used for making metal, so that no expense will attend the substitution of the new material. It is stated that thorough experiments have been made and the adaptability of the glass to the purpose proved.

THE EXPORT OF TOYS.—In former years, a large portion of the toys used in this country came from Europe. Now the trade is the other way, and the Old World is buying largely from America, not only the peculiarly American inventions, but also the toys which formerly were made abroad. The export trade in toys, which amounted last year to over \$1,000,000, began five or six years ago. Then E. G. Williams, the agent of a large exporting firm, says a number of bankers sent some American-made toys to Cuba and South America. The trade then extended to London and thence to Hamburg and Paris. Now nearly every foreign steamer carries large quantities.

PNEUMATIC CLOCKS.—A company has been formed in Paris for working the system of pneumatic clocks—time-measures by air-pressure—adopted successfully in Vienna. The compressed air is fed into a reservoir, which gives off a uniform pressure of half an atmosphere, the compressed air received by each clock being released by a pellet and pendulum in the usual way. A large number of clocks can be grouped in connection with a single reservoir, and the time can be laid on to houses by piping, just as gas and water.

SCIENTIFIC PROGRESS.

Poisoned Arrows.

EDITORS PRESS:—The account given by your correspondent, in a recent number of the *Press*, of arrows poisoned by the American Indians, recalls the following statement made in "Hardy's Travels in Mexico" (London edition of 1829, p. 298), of the Seris Indians, who inhabit the island of Tiburon, in the Gulf of California, a short distance north of Guaymas:

"They first kill a cow, and take from it its liver. They then collect rattlesnakes, scorpions, centipedes and tarantulas, which they confine in a hole with the liver. The next process is to beat them with sticks in order to enrage them, and being thus infuriated they fasten their fangs and exhaust their venom upon each other and upon the liver. When the whole mass is in a state of corruption, the women take the arrows and pass their points through it; they are then allowed to dry in the shade."

This addition to the information already furnished by your correspondent, enlarges the area within which this horrible device was practiced, at least 1,000 miles in a southwestern direction, and adds a further interest to the curious fact. Another fact, equally interesting, is that Cortes, Diaz, and the other historians of the conquest of Mexico by the Spaniards, make no mention of poisoned arrows, which they could not have omitted to notice, if they had met them; yet the Aztecs could not have been ignorant of them, for their knowledge of everything within thousands of miles on each side of their capital was not only precise but very minute. Had they, then, rejected poisoned arrows as instruments of warfare, from the same sentiment which prohibits explosive bullets at this day?

J. W. D.

San Francisco, Feb. 9th.

Philosophy of Spontaneous Combustion.

Mr. Chas. W. Vincent, in the *Journal of the Society of Arts*, has a long paper on spontaneous combustion in factories, ships, etc. From it we make the following extracts concerning the philosophy of spontaneous combustion, which deserves the most careful consideration from all manufacturers:

Strictly speaking, there is no such phenomenon as spontaneous combustion. The inflammation of various organic and inorganic substances without the immediate contact of any ignited matter, which has given rise to the term, is nevertheless, as certainly the result of some direct act or acts which can be accurately traced, as is the firing of a lucifer match when struck on a rough surface.

It need not be a matter of surprise that bodies containing so much bound-up heat as do the vegetable fibers of all kinds, more particularly hay, cotton, etc., coal of all kinds, oily rags, greasy sawdust, varnish rags used by painters and polishers, the waste at railway lamp stores, etc., should be particularly liable to take fire when stored in bulk.

Spontaneous combustion of these substances can only take place when they are so packed that small increments of heat may be stored up. If they are freely exposed to the air, the heat evolving action which goes on with it may be increased rapidly; but, as when the hand is waved in mobile air, the infinitesimal blows are free to rebound and react over so large a space that their effect is dissipated. But when their striking space is limited they act like the struck air inclosed in the fire syringe, their heat motion is intensified by concentration, and ultimately throws the whole mass into such commotion that the moving power of the molecules is manifested as light as well as heat.

But there must be a beginning to this heat motion. Oiled rags and bodies of that kind derive the initial movement from the oxidation of the oil. Perfectly dry vegetable fiber at ordinary temperatures oxidizes extremely slowly; it is practically indestructible by atmospheric oxidation. Mummy cloths possess much strength after the lapse of two or three thousand years. Oils, however, are formed at the expense of a still larger amount of heat than vegetable fiber; the elements comprising them are combined much more loosely, and they are, consequently, ready to form more stable compounds, and release their bound-up heat on very slender provocation. Oils absorb oxygen with great avidity, becoming viscid, and in case of drying oils, solid. In doing this they give out heat, which is due partly to the condensation of the oxygen, and partly to the carbon and hydrogen of the oil having, by combination with the gas, lost part of their energy; in fact, they have been partially burnt.

Microscopical Society.

The annual meeting of the San Francisco Microscopical Society was held on Thursday evening, February 7th, with a good attendance of members and Vice-President H. C. Hyde in the chair. The annual report of the President was necessarily deferred till the next meeting, in consequence of Prof. Ashburner being in Oregon, but the report of the Treasurer, Mr. T. A. Langstroth, was read, and showed that the Society was in a very flourishing condition.

Proceeding to the election of officers for the ensuing year, the result was as follows: President, Henry C. Hyde; Vice-President, C.

Mason Kinne; Recording Secretary, N. Y. Clark; Corresponding Secretary, C. W. Banks; Treasurer, J. A. Langstroth. The best of feeling prevailed and there seemed to be a unanimity of purpose to make the seventh year of the organization one of the most profitable from a scientific standpoint and several papers on important subjects were promised for coming meetings.

The promotion of Col. Kinne to the Vice-Presidency is worthy of special mention. He has served the Society as Secretary for a number of years in a most intelligent and faithful manner. His reports, published in the leading scientific journals at the East, have done much to secure recognition for the good work which the Society has done—a recognition which has resulted in awarding the San Francisco Society the leading place among similar organizations in this country. Col. Kinne's reports, printed in our local papers, and his gentlemanly personal presentation of the claims of the Society, have also done much in building up the local membership and in inciting members to careful, systematic work with the microscope. We are glad to note his advancement.

The Liquefaction of the Gases.

A week or two ago we gave an account of the liquefaction of oxygen, and hinted that nitrogen and hydrogen had also been conquered. The account of this latter achievement comes to us in a foreign exchange containing the following, which was presented to the French Academy of Sciences: "M. Berthelot begs to say that he witnessed the experiments conducted by M. Cailletet yesterday and to-day on nitrogen and hydrogen. The liquefaction of nitrogen seems to leave no room for uncertainty after the succession of the phenomena which have been described. The observations made on hydrogen yielded signs of liquefaction which, to his eyes, were not doubtful. They were, however, less complete and more difficult to appreciate than in the case of nitrogen. From their appearance and the brevity of their duration, they may be compared with the attenuated liquid dust produced towards the end of the phenomena, recognized with nitrogen at the moment when the cloud is vanishing. The extreme tenuity of the liquefied particles constituting this hydrogen mist—a sort of diffused luminosity—as well as their more rapid return to the gaseous condition, accorded entirely with the comparative properties of hydrogen and the other gases. That which characterizes M. Cailletet's experiments, and gives them the certitude which belongs to them, is the fact that in one and the same transparent and limited space, they permit the comparison of the gas in the three successive conditions of a compressed elastic fluid, a pulverized liquid, and a fluid in great part expanded. We must also take into account, in estimating the value of M. Cailletet's experiments, the facility with which each can at once be repeated as often as may be desired, so that each phase of the phenomenon can be reproduced for separate study. More in such a matter cannot be demonstrated; at least not until some scientific man, profiting by the recent discoveries, succeeds in isolating in the static condition of stable liquids, capable of being kept permanently under observation, the gases which have been liquefied for the first time by M. Cailletet in a dynamic state, if I may be allowed the expression—that is, in the state of liquids which, momentarily formed under the observer's eye, at once evaporate and escape observation."

MUSEUMS AS USEFUL INSTITUTIONS.—Prof. Marsh in the *Popular Science Monthly* says: The old idea of a museum was a showroom; the modern idea makes it a work-shop as well. If this institution is to hold high rank in science, as we hope, it will not be in consequence of the spacious halls before us, crowded though they be with the rarest of Nature's prospects; but, rather, it will come through the small work-rooms in the attic, where the naturalist, with microscope or scalpel, has patiently worked out discoveries that add to the sum of human knowledge. This museum will fail of its highest good, fail even to achieve more than a local influence, unless the work-rooms above are made the most important feature of the whole. These vast collections will spread the elements of natural science among the people of New York, and the surrounding region; but the quiet workers in the attic, who pursue science for its own sake, will bring the museum renown throughout the world.

PRESENCE OF BENZENE IN COAL GAS.—The presence of benzene in coal gas has been verified, says a French paper, by the action of fuming nitric acid upon the gas and the subsequent reactions of the nitro-benzene formed. It is also found that nitric acid does not act upon ethylene in an appreciable manner, so that this method of estimating the quantity of benzene is not vitiated by the presence of ethylene. Experiments show that only traces of benzene and ethylene are soluble in monohydrate of sulphuric acid (H-S-O₄·H₂O, sp. gr. 1.781 at 14°), whilst on the other hand propylene and acetylene are completely absorbed, the former in a few minutes, the latter in 25 minutes. The illuminating power of gas is due mainly to the presence of benzene, and it would seem that the illuminating power of a flame is not due to the numerical relation of the carbon to the hydrogen, but, as Franklin has shown, to the condensation of these elements in the unit of volume.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

ALPINE.

MINE SOLD.—Alpine Chronicle, Feb. 2: B. E. Hunter, of Monitor, returned from San Francisco on Wednesday's stage. We are glad to be able to note that Mr. Hunter concluded a sale of the Tarshish mine, mill, etc., to a San Francisco company, and that work will be started as soon as the new owners can make the necessary arrangements. The Tarshish is a valuable property and we hope its development will be prosecuted with energy by its new owners.

AMADOR.

LINCOLN.—Amador Ledger, Feb. 9: The second clean-up of this mine since the resumption of work, was made last week. We have not learned the exact amount of the run, but are able to state on the best authority, that the yield was satisfactory. The ore is being taken from the 200-ft and 400-ft levels. Drifts are being pushed into the northern portion of the mine—comparatively unexplored country. Between 60 and 70 hands are employed around the mine and mill, the full capacity of the latter, 40 stamps, is kept running constantly.

CENTENNIAL.—This mine is located on Dry creek, two miles from Plymouth. Appearances indicate that it will make its mark in the future history of Amador county. The ledge is seven feet thick. A small seam of slaty matter, two or three inches thick, runs through the ledge. This is found to be rich in gold and sulphurets; coarse gold is frequently met with, and the owners are sanguine that the rock will surrender in the batteries a handsome quantity of the coveted metal. Rock is being hauled to the Bonanza mill, at Drytown, for crushing, so that in a short time we hope to be able to report definitely as to the richness of the quartz.

PHENIX.—The Phoenix mill is crushing 170 tons of ore per day. The rock has all to be hoisted out of the south shaft, as it will require another three weeks to sink the sump in the north shaft.

CALAVERAS.

GRAVEL MINING.—Calaveras Chronicle, Feb. 6: We have no new developments in gravel to chronicle, but the situation is encouraging. In the first place, there is an abundance of water, and secondly, good use is being made of every drop of it. All the hydraulic and tunnel claims are running full-handed, and although no clean-ups have yet been made this season, the outlook is extremely favorable. Several new claims have been opened since the rains set in, and considerable prospecting is now being done. More claims are being worked in this vicinity at present than during any other season for the past 10 years, and the prospects were never brighter for good returns. No other section of the middle or southern mining counties can begin to compare with this in extent of gravel mining operations, and work was never before pushed so vigorously here as this winter.

RICH QUARTZ.—In the neighborhood of 100 tons of quartz from the San Bruno mine, at Mosquito, was crushed in Garland's mill. The rock was rich. Exactly how much the average yield per ton was we don't know, but it didn't vary much from \$60. With the new machinery in place work on the mine is progressing finely.

NEW HOISTING WORKS.—The Buena Vista mine at Railroad flat, owned by Roentgen, Sundermeyer & Co., has resumed operations. The new hoisting works, designed and erected by Mr. J. S. Swank, are of the most substantial character—a model of strength and convenience. The motive power is a hurdy gurdy wheel, running under 120 feet pressure. The water is raised from the mine by a six-inch improved plunger pump, manufactured by S. N. Knight, Sutter Creek, Amador county, and is the most complete working pump for sinking purposes in use.

AT THE GWIN.—Moore & Co. had to stop work on account of the recent rains. Their lead is south of the Gwin mine on the same lode. Dodge & Co. are pushing things ahead. Shaft 100 feet deep and an excellent quality of asbestos. Seaver & Co. have commenced work cutting a ditch from the main canal to French bar to start a hydraulic. The company will have one of the largest claims in the county.

MOSQUITO ITEMS.—The San Bruno is owned by Kellogg & Co., of San Francisco, W. H. Rodda, Esq., Superintendent. This mine has had a thorough renovation, new pumps, new engines and a new crew of men to work it. Result—a crushing of 91 and over tons, which paid in the neighborhood of \$60 per ton. Blue Jay, owned by H. W. Potter & Co. Vein, five feet wide, and the rock taken from this mine is A 1. Jack Donovan, the underground foreman, tells me it will go at least \$130 per ton. Peter Gass mine is sold, by J. J. Holmes, Esq., to San Francisco parties; price paid, \$2,000. John, the Butcher mine, owned by Butcher John, Breto & Co., have their tunnel in about 60 feet. Men are now driving tunnel and stopping. Between 50 and 60 tons of rock on yard, that will pay about \$60 per ton.

EL DORADO.

THE KEEGAN MINE.—Mountain Democrat, Feb. 9: Superintendent Wickham is pushing the tunnel right ahead at the Keegan mine. The greater part of the past week has been spent in clearing out and timbering the tunnel.

This being completed, the tunnel will be pushed through the hill as rapidly as possible. A force of men is also kept at work on top of the hill, sinking the shaft.

AT WORK AGAIN.—On account of the scarcity of water, caused by the freeze, a few weeks back, work was suspended at the Placerville mining company's hydraulic claim, on Sacramento hill. About two weeks ago water was again turned on and the mine is now being more vigorously worked than ever.

RICH.—It is now a pretty well settled fact that Mr. Hallock, who some time ago purchased the old True mine, in Big canyon, has struck it very rich.

BAD CUT.—Last Thursday morning, Henry Herrill, son of Mr. Eli Herrill, of this city, went to work at the Excelsior mine, Coon Hollow, and a little before noon, of the same day, a rock fell from the bank, striking him on the head, causing a very painful, though probably not serious wound.

FRESNO.

NEW MILL.—Fresno Republican, Feb. 9: The G. M. Co. recently erected a five-stamp mill at their mine in Fine Gold gulch, in this county, and made a very satisfactory trial run of three days, crushing 33 tons of quartz, which yielded a little over \$1,500 in bullion. The mill is run by a turbine water-wheel. The Co. have about 80 tons more of the same quality of quartz on their dumps, but owing to the recent heavy rains which render their new road very soft, they deemed it best to defer hauling ore over it until it settled a little. The main shaft is down 100 feet, and they now have ten men employed in running drifts, preparatory to stopping out ore. They have a large quantity of fine ore in sight, and the prospects of a valuable mine are very flattering. The copious rain fall is stimulating our mining interests to an unusual degree, and we have intelligence of lively business in prospecting, both in quartz and placer mining, in the foothills of the Sierras in this county. There is no question but Fresno county is rich in precious metals, and will at no distant day take rank with the paying mining counties of the State.

INYO.

NEW DISTRICT.—Coso Mining News, Feb. 9: A new district has been formed for the section of country where the late gold discoveries were made and is called "Beveridge." A Recorder has been elected and by-laws adopted. The mines are situated about 16 miles northwest from Cerro Gordo, on the eastern slope of the Inyo mountains, nearly opposite the Eclipse company's mines, which are on the western slope. The ledges are said to crop boldly and are traceable for a long distance. At present the easiest way of reaching the mines is by way of Cerro Gordo. From that place keep along the mountains to the mines.

BULLION SHIPPED.—On the 3d inst. the Emigrant company shipped, per Wells, Fargo & Co.'s express, 170 pounds silver bullion, valued at \$3,000, and on the 7th inst. the Sheldon company shipped gold and silver bullion, valued at \$2,000. To-day the Emigrant made another shipment of 173 pounds, valued at \$3,200. Total for the week, \$6,200.

NEVADA.

CRUSHING.—Grass Valley Union, Feb. 12: Another crushing of 60 loads of Centennial rock is being put through at the Orleans mill. It is believed it will go \$200 to the load. The ledge in the mine continues regular, and although small in size, it is very rich—and what is more satisfactory, it does not run to specimens.

The hydraulic miners of this county have all been busily at work for a week or more, but yesterday's snow storm will prove troublesome in the upper portion of the county by choking the ditches and checking the flow of water. When a ditch becomes choked with snow it sometimes involves immense labor in clearing it out, as the snow has to be shoveled out for miles.

GOOD ROCK.—Nevada Transcript, Feb. 9: We understand that Ebaugh and Lowey, whose quartz claim is near Kitts' mill, Willow valley, are taking out some splendid rock. The last crushing yielded \$2,400, or about \$55 per ton. The quartz mines in that section are looking better than ever before, and the prospects are good for the discovery of many valuable ledges. Previous to the storm, a large amount of prospecting had been carried on, which will be continued as soon as the weather is favorable.

DEADWOOD MINE.—The topic of conversation in town, yesterday, was the rich strike in the Deadwood mine. The owners have done some heavy work in the mine, believing that it was only a matter of time when a fine ledge would be uncovered and they would be fully repaid for the money they were expending. On Thursday evening last they found a ledge 20 inches in thickness, and the rock will go into the hundreds of dollars per ton. Work is being rapidly pushed ahead and in a short time the true value of the discovery will be demonstrated.

MURCHIE.—Nevada Gazette, Feb. 9: Stems for the Murchie quartz mill were being hauled to that place yesterday. They have been taking out large quantities of first-rate ore since the erection of their hoisting works, about a year since, consequently the erection of additional stamps to their present number.

PLACER.

IOWA HILL ITEMS.—Cor. Dutch Flat Forum, Feb. 7: The late rains have filled the old ditches and washing in every direction has commenced in earnest. Water was also expected to reach the big reservoir of the canal company last

week. The new cement gravel mill at Wisconsin hill is about completed, and will commence operations immediately. It is very simple in construction, being nothing more than a cylindrical tube, set on a slight grade, 30 feet long, with four-inch iron bars equidistant. As the cylinder slowly revolves, the fine dirt and gold fall between the apertures of the bars into the amalgamators and the large rock rolls out at the lower end. It is held that 200 tons a day can be worked. If so we do not see how it can be a failure; the percentage per ton which it is held will yield a profit, being so small that it must succeed. The crack Orion claim (nine shares) is reported sold to San Francisco men for \$30,000. It will cost \$6,000 to put the claim under the pipe. The price is considered a good evidence of a rise in the value of our mining ground of the district. But, it must be remembered, such sales could never have been made, or such prices obtained, if it had not been for the construction of the Iowa Hill canal. By and by more sales like this will be heard from. The discovery in the old Damascus claim proves to be a new development, even more extensive and rich than first anticipated. It is now opened at several different points west of the old tunnel, and shows equally well in each.

SISKIYOU.

EMPIRE.—Yreka Union, Feb. 9: The Empire Co. have decided to build their mill on the bank of the Klamath river, between Chris. Aroe's house and the Centennial Bar claim, and expect to have it in running order by the first of June next. This will necessitate the building of a road about one and three-fourths miles in length from the mill site to the mine, and work on which will be commenced immediately.

GROUND sluicing is now being proceeded with vigor in nearly all placer claims in the county.

THERE will be claims worked this year that have lain idle for a long time for want of water.

ON Sunday night the waters of Humbug creek, broke through the head dam of the Big Flume company, on Humbug, and nothing but the utmost exertions of all the men saved the claim from being filled up.

THE raise in the Klamath river on Sunday necessitated the taking out of the wheels and pumps in the Pacific claim, formerly known as the Clark claim, in the Klamath river, at or near the mouth of Humbug, and consequently all the work is stopped for awhile.

WE learn that Cornish & Co., have about 100 tons of quartz on the dump of their mine, and that the ledge looks very favorable. It is now about four feet wide, with good looking foot and hanging walls, and the quartz taken out prospects well. The company are having a dump house, to hold 400 or 500 tons, built at the mine. They think of moving their mill up to the mine.

THE organizing of the new mining company for the purpose of mining in Yreka creek, is progressing very favorably, and the stock is being taken rapidly, over 100 shares more having been subscribed for during the week, and we think it will not be long ere the remainder of the stock will be all taken and the enterprise be under full headway. It is proposed to call the company the "Lucky Baldwin."

TUOLUMNE.

PHENIX RESERVOIR.—Union Democrat, Feb. 9: Owing to the heavy rains, especially on Wednesday night, great fears were entertained that the dam of the Phoenix reservoir would be carried away. The flood gates are insufficient in capacity for a very heavy flood. The officers of the water company were doing all that could be to save the structure on Thursday. Should it break, the damage will be serious, not only to the owners, but to a large portion of our mining interests.

Nevada.

WASHOE DISTRICT.

SILVER HILL.—Gold Hill News, Feb. 13: During the first part of the week, east crosscut No. 2, south of the turn-table, in the main south drifts on the 600-ft level, cut through a vein of ore four feet in thickness, careful average sales of which give returns of \$45 per ton. Some of the ore in this vein is very rich, assaying as high as \$200 per ton. The entire four feet has a fine, lively look, and, beyond a doubt, will lead to a much larger deposit when traced to its source.

MEXICAN.—The lining of the pumping compartment of the Ophir shaft has created a draft that has greatly cooled the mine, and has enabled the resumption of work in the face of the west drift from the main north drift on the 1900-ft level.

ALTA.—Sinking the main shaft is making good progress, the bottom in soft vein matter, showing a near approach to the main ledge. Some of the streaks of quartz cut through afford excellent assays of both gold and silver.

SIERRA NEVADA.—The 1800-ft station in this winze is completed and the sinking has been resumed. This is a large double compartment winze, making a complete working shaft, and will now be continued directly downward to the 2000-ft level. It is being sunk at an angle of about 35° and is being pushed downward at the rate of five feet per day.

CALIFORNIA.—Daily yield, 700 tons of ore. The ore stipes on the 1650-ft level going north continue to yield rich ore and show well at every point. On the 1600-ft level the ore stipes are yielding good ore and the south drift from winze No. 3 is still advancing in very rich ore. A drift west is also being run to determine the

width of the ore body at a point opposite the winze, which is now in 34 feet, the face still in rich ore. The ore stipes on the 1550 and 1600-ft levels are yielding good milling ore, with plenty more in sight. The mills are all well supplied with ore and are kept crushing to the full extent of their capacities. The usual monthly dividend of \$2 per share, aggregating \$1,080,000, will be paid on the 15th inst. The present condition of the mine and everything pertaining to it could hardly be better or the future prospects brighter.

OPHIR.—All the force possible were brought to bear to line the pumping compartment of the shaft and create an upcast through one compartment, leaving the other three compartments downcast. Notwithstanding this, the work was not completed and any considerable cooling effect felt in the mine until day before yesterday, when the bulkhead was removed and a new 15-inch air pipe was placed in the south drift, east of the ore vein, and a strong current of air driven in. This is gradually cooling the drift and work was resumed in the face this morning, which is showing some fine streaks of quartz and ore. At the rate at which the air is being cooled on the lower levels, everything will be in good condition for a general advance of work in every quarter of the mine by the close of the week.

BELCHER.—The north incline or drain shaft is down to-day 20 feet below the 2200-ft level, the bottom in good sinking ground. The pumps and rods are all in good working condition down to the 2160-ft station. The south drift on the 1900-ft level is still advancing through quartz that assays from \$10 to \$15 per ton.

UTAH.—The south drift on the 1350-ft level is being steadily advanced, the face still in vein porphyry of a lively, favorable look. The face of the west crosscut near the north line is penetrating more favorable ground, the porphyry being softer, and showing occasional fine stringers of quartz.

BEST & BELCHER.—The joint winze in crosscut No. 1 on the northern boundary line on the 1700-ft level will be a double compartment working winze, and will be sunk perpendicularly to the 1900-ft level, where it will be connected with the north drift now being run from the Gould & Curry east winze.

YELLOW JACKET.—Sinking the new shaft is making excellent progress, and everything is working splendidly. The broken pinion has been replaced by a new one, and now gives no further trouble.

OVERMAN.—Sinking the main shaft is making steady progress, the bottom in hard blasting rock, with considerable flow of water. Sinking the south winze below the 1400-ft level is also making good progress, the bottom being in a fine character of lively vein matter.

UNION CON.—The heat in the joint east drift on the south line, on the 1600-ft level, is not so great, and much better progress is being made. During last Sunday night the face of this drift cut into a fine quartz formation carrying some ore, the whole being intermixed with streaks of porphyry.

HALE & NORCROSS.—The water in the main incline is reduced to-day to a point 20 feet below the 2000-ft level, where it has been held while the donkey pumps were being lowered. These are now in place, and the drainage of the mine will now be pushed ahead with the usual vigor.

LADY WASHINGTON.—The south drift on the 850-ft level has reached the south line, where a winze has been started to connect with the north drift on the 1000-ft level of the Justice mine. The bottom of this winze is in excellent quartz and ore.

CON. VIRGINIA.—Daily yield 600 tons of ore, which is being crushed as fast as it is extracted. The surplus supply of ore at the mills continues to hold out, and the ore stipes in the mine show well in every part. On the 1650-ft level the stipes going south could hardly look better, while on the 1550-ft level they continue their usual yield of rich ore. The 1500, 1400, 1300 and 1200-ft levels all have exposed ready for extraction many thousands of tons of rich ore. The yield of bullion for the month of January was \$1,613,162, and the usual monthly dividend of \$2 per share, aggregating \$1,080,000, will be paid to the shareholders to-morrow.

JUSTICE.—Daily yield 85 tons of ore, which is being crushed at the Pacific mill as fast as it is extracted. Average assays of the pulp from the batteries range from \$38 to \$45 per ton, showing a very favorable increase in the value of the ore extracted. The ore stipes are showing well on both the 1000 and 1150-ft levels, and it is believed that a still greater increase in the value of ore milled will be made in a very few days. The northwest drift on the 1000-ft level is steadily advancing, the face in ore, an average assay of which, made yesterday morning, gave a valuation of \$45 per ton.

BULLION.—The bottom of the incline shaft and the upraise are now only about 70 feet apart. The north drift on the 2000-ft level is being steadily advanced, the face in an improved character of vein matter mixed with quartz affording low assays.

CALEDONIA.—The north drift on the 1500-ft level is steadily advancing, the face in porphyry and quartz.

SUTRO TUNNEL.—Total length of tunnel to-day, 13,931 feet. The number of feet driven during the past week was 51. The flow of water from the mouth of the tunnel is 1,286,500 gallons per day. The temperature of the air at the header is 108°. The ground in the face has every appearance of vein matter.

GOULD & CURRY.—The upraise from the

1900-ft level to connect with the bottom of the incline, is being forced vigorously forward.

COS. IMPERIAL.—The north drift from the station at the 2400-ft level is being steadily advanced in quartz and vein matter of a fine character. The quartz affords low assays.

NORTH COS. VIRGINIA.—The west drift on the 1300-ft level is making excellent progress, the face in a splendid character of soft birdseye porphyry.

SAVAGE.—The water is reduced to-day to a point 25 feet below the 2000-ft level. The complete drainage of the mine appears now to be a matter of a very short space of time.

CROWN POINT.—Daily yield, 60 tons of ore, from the old workings on the 160-ft and 230-ft levels. Sinking the winze below the 2000-ft level is making excellent progress.

STEELE.—Sinking the main shaft is being pushed ahead with steady vigor, the bottom in soft porphyry of a lively character, carrying occasional streaks of clay and quartz.

LEVATHAN.—Sinking the main incline is being pushed vigorously forward, the bottom being in fair working ground. It is now down 11 feet below the 600-ft level. The shaft is being thoroughly timbered.

EUREKA DISTRICT.

MINING NOTES.—Eureka Sentinel, Feb. 6 to 11: During the last five days \$52,000 in crude bullion was shipped from here. The Richmond company's three furnaces turned out crude bullion last week valued at \$95,000. The newly discovered ore body on the 450-ft level of the Hamburg is attaining large proportions. The Richmond furnaces are reducing an average of 50 tons of ore each per day. The cave at the Connolly mine has had the effect of retarding ore shipments. They will be resumed as soon as the debris is hoisted out of the mine. The four calcining pans at the Richmond refinery are in full blast and working up to their utmost capacity. The Hoosac company employs 14 miners at present. The flow of water into the K K mine, when the pumps are running, will average 100,000 gallons per day. The ore bodies on the third and fourth levels of the K K mine are furnishing sufficient ore to keep the furnaces in steady operation. The bullion tax for the last quarter will amount to \$23,000. This source of revenue is a financial bonanza to Eureka county. The Selby reduction works, of San Francisco, refine the bulk of the crude bullion shipped from this point. Some 2,000 tons of Eureka lead has been shipped to China in the last two months. Part of this was from the Richmond, and the balance from Selby's smelting works. Thirty-one car loads of crude bullion, three of fine dust and six of refined lead, were shipped in the past five days.

Arizona.

PLACERS.—Arizona Star, Feb. 7: We have been shown a piece of ore lately extracted from the Esperanza, assaying into the thousands. All that this mine wants is some capital to work it systematically to develop it into a lucrative property, perhaps into a bonanza. Mr. R. H. Stretch, a mining engineer, is now on his way to this city to examine the property.

DRY WASHES. several in number, have passed through Tucson, en route south to the placer diggings, since our last issue. Prospectors have given the owners favorable reports, and should they be successful it will open up a large and paying business for southern Arizona.

MOUNTAIN SPRINGS.—Arizona Enterprise, Feb. 7: Mr. Gorton arrived here recently from a trip through southern Mohave and western Yavapai. He found everybody busy on and around the McCrackin mine. A gentleman named Wilson is erecting a furnace in Mount Spring district, which is about 60 miles this side of Signal City. This district has several promising silver lodes.

CASTLE DOME.—Arizona Sentinel, Feb. 9: The Arkansas mine has been sold by Lige Bettis to Bagley, McPherson & Pickens, of San Francisco. This firm has lately been picking up several good properties in this county, at great bargains. No lead has been taken out of the Arkansas below 100 feet, except what was hoisted in sinking two shafts about 80 feet below that point. All the lead that has been shipped from this mine has been extracted from near the surface, and from a mere fraction of the claim. The metal is continuous in the shafts and widest near the bottom. The last 80 feet have disclosed more lead than was shown by the first 100. The new owners have secured a valuable property. Mr. Williams was here this week, and reports very well of the mines he is working, as well as others in the district. Talk is cheap, and it has become a custom to lavish a good deal of it on mining prospects. But one fact is significant, which is this: When any miner now at Castle Dome draws an order on our Yuma merchants, that order is paid on presentation. The miners of that district have no very big assays to brag of, but they weigh their products by the ton and not by the ounce. Silver is well enough, but it takes no Act of Congress to make a market for Castle Dome lead.

Idaho.

ROCKY BAR.—Cor. Owyhee Avalanche, Feb. 3: During the last few days we have had the most severe snow storm of the season; hlocking up the roads everywhere in the mountains.

MINING AFFAIRS ON BEAR CREEK are living up considerably. The Vishnu boys are going ahead splendidly, developing as usual with excellent results. Northeast of the Vishnu about three-fourths of a mile, Harrington, Fitzgerald and

Callahan are running a tunnel to tap what is known as the Mountain Buck lode. On the surface and to the depth of 30 feet the ore from this mine yielded handsomely. The new tunnel is being started on the north side of the hill for the purpose of cutting all the ledges north of the Mountain Buck. Already one very fine vein of quartz has been cut that prospected well in gold. The owners have about 75 feet further to run before intersecting the main lode. Andrew Kramer owns and works the Siara and Chaney mines, eastern extensions of the Idaho and Vishnu lodes. He is running the Montana tunnel which intersects the Siara 400 feet from the mouth of the tunnel. With about 80 feet further tunneling the Chaney mine will be intersected. Supt. Rollins commenced sinking a winze from the present level of the Confederate Star, intending to go down about 75 feet. This is for prospecting purposes. Mr. Rollins will commence in the spring to sink a shaft 500 feet deep on the Elmore extension. This is one of the honest companies of Alturas. They are deserving of success. I am informed that Thomas L. Johnson and Henry Hesford struck it rich in the Idaho Bonanza situated close to the old Alturas mine. Another rich strike is reported in the Red Warrior district, made by Mr. Henry Wakefield on the Frenino or close by it. There is quite a number of miners working for themselves in that district and are doing remarkably well. Favorable reports come from Atlanta. The Buffalo Co. have completed the first 100 feet of their working shaft below the present level, and are continuing down another 100 feet. Jones, Davis & Co. are prospecting on the great Thkomo lode, it being 100 feet from wall to wall. Pay ore is found the whole distance. Wm. Doolin, James Newton & Co. are doing well on the Last Chance mine. Thomas & Co., of the Canora mine, are running the ten-stamp mill of Colonel Mattingly night and day. The Monarch and Buffalo mills are continually reducing ore and large quantities of bullion from those mills are passing through here weekly—a very good indication of the wealth of Atlanta.

CHARIOT.—The Golden Chariot is looking well, and the prospects are much more encouraging at the 15th than they were on the 13th level.

POTOSI.—At the Potosi a considerable quantity of rich rock is being turned out daily.

BLACK JACK.—The account from the Black Jack mine continue to be very encouraging. The ledge is improving all the time, and the great bulk of the rock taken out, without being assorted, will average somewhere in the vicinity of \$50 to the ton.

The Jones mill near Wagontown is running on Lepley rock. The last crushing from the Webfoot turned out quite well.

FAVORABLE SEASON.—Idaho World, Feb. 5: Miners on the other side of the Basin are confident of a good placer mining season this year, as the ground is thoroughly soaked and considerable snow on the mountains.

The Belshazer mine, on Fall creek, is looking fully as well, if not better than ever before.

Oregon.

MONUMENTAL SILVER MINE.—Oregonian, Feb. 2: But little has been published concerning the progress of work on the above mine since the company had one and a half tons of ore worked in this city, making a silver brick of the value of \$812. The work done since has been in driving the tunnel. It will be remembered that the shaft sunk on the Monumental mine was at a depth of 115 feet. The tunnel was commenced at a distance of 582 feet from the shaft to strike the ledge at 300 feet. In the progress of this tunnel four ledges have been cut, all good ore. When the tunnel was in 486 feet, the air was such that more ventilation was necessary and a full force of men were put to work in sinking an air shaft, which was commenced on a ledge 435 feet from the mouth of the tunnel. By working both from above and below, this important feature was completed on the 15th inst., thus affording fine ventilation and enabling the work, both in the tunnel and drifting on the ledges, to proceed more rapidly. Advice was received at the office of the company here, November 27th, that the tunnel had just cut a ledge of ruby silver ore, one foot wide, and yesterday a dispatch was received from C. S. Miller, Superintendent, that the tunnel had cut another ledge of good ore. This ledge is but 75 feet from the Monumental ledge, which, with the progress now being made, will speedily be reached. The richness and extent of the Granite creek quartz region is in a fair way to be demonstrated and establish the fact that Nevada does not contain all the silver on the Pacific slope.

VIRTUE.—Owyhee Avalanche, Feb. 9: M. Hyde, Esq., writes us from Baker City, under date of January 31st: "The Virtue mine will start up in full blast as soon as the Cornish pump, now being built in San Francisco, arrives here. I just cleaned up \$9,000, the result of 12 days' run on rock taken out by men working on tribute. I have recently purchased what is known as the Green discovery mine and mill at Rye valley for the sum of \$14,000. This is a good property, and everything will be put in running order by the 1st of May." From information from other sources, it looks as though eastern Oregon had good prospects for the coming season, and that the mining yield will be greatly in excess of what it has been for years past.

Utah.

BIG COTTONWOOD.—Salt Lake Tribune, Feb. 10: Five feet of snow fell this last storm in Big Cottonwood. The Reed and Benson ships high grade ore. They have struck a fine body

in the lower works and are moving ore every day. The Carbonate has been worked under difficulties. Every morning the men have to go from the mine and shoot away the comb or crest of snow that drifts during the night. This carries with it a huge slide and clears the trail, then the men from below begin to move up. The large log cabin at the Emperor, or Groesbeck tunnel, was swept away by a snowslide the other day.

DRY CANYON.—There are a good many prospectors waiting for the snow to clear off a little in order to turn out some more bonanzas. The sinking of the main shaft on the Mono continues, and very high grade ore is being extracted. Mr. Clark, the manager, is confident the Mono will ere long be the mine it used to be.

BINGHAM.—The ore shipments over the Bingham railroad for the week ending Feb. 7th, were 941,741 pounds. Hlans & Co., made a large shipment from the old Ten-Forty on Friday last. A tunnel is being run on the Jordan vein by Prof. Holden. It is in about 350 feet now. Shipped yesterday from the Revere leaching works, Bingham, about \$2,640 worth of leached silver. The Shettle Bros. made a shipment of \$80 ore last week from the Cresus. The snow retards the work some. Thirty feet more and the Steamboat tunnel will be in the ledge. Watson & Ireland are now in pay gravel in their shaft, but are not yet on the bedrock. They have taken hold of Bingham's rich placers with improved machinery, and are going to make money this spring. The ledge was struck in the Greeley tunnel last week. The vein is 14 feet wide, in which is a streak of ore assaying 77 ounces in silver and 56% lead. The tunnel is in 500 feet and taps the ledge at a depth of 300 feet. Donahue & Wooster struck rich gold in the Bulldozer. This mine is near the Saratoga, and a relocation of the oldest mines on that hill. The vein is supposed to be a continuation of the Steamboat and is the richest ore of its class ever struck in Bingham.

PARK CITY.—The Ontario mine shipped for the week ending, Feb. 9th, 27 bars, valued at \$39,539.22.

ALTA.—Ore is being piled on the Butte dump. The Toledo folks are piling up ore and shipping when the trail is good. The Iris Tunnel Co. are to start up in the spring with improved machinery. Charley Reed ships about 300 tons a month from the Alta Con. There was shipped over the Alta tramway, for the week ending Feb. 6th, 713,350 pounds of ore. The old Emma continues to make some nice shipments. The Flagstaff is running as usual.

OPHIR.—Teams will commence hauling ore in a few days for the leaching works. Considerable fair grade ore is being shipped from the Nevada tunnel.

SANDY AND WEST JORDAN.—Three stacks are running at the Mingo works. All the sampling works are busy handling ores. The Big Cottonwood smelter, owned by the rustling Ben Morgan, is running regularly on Cottonwood and Bingham ores. The old Telegraph smelter is running on the Jordan. It is the intention to work up all the material at the works and then shut down unless the lead market is brighter.

News in Brief.

THE pay-roll of the Suto tunnel company is \$10,000 per month.

THE miners in the Savage mine can hear the blasts in the Suto tunnel.

THE Black Sand mining company, organized to gather the gold from the sands of the Oregon coast, has filed a petition in bankruptcy.

AT the annual meeting of the Pacific Rolling Mill Company, William Alvord, L. B. Benchley, B. P. Brunner, Lonis McLane and D. O. Mills were elected Trustees for the ensuing year.

THE Grand Prize protests against the issuance of a patent to the Grand Prize West company. The machinery of an iron foundry is real estate, according to Judge Allison.

THE bullion shipment from Tuscarora was only \$8,100 last month. The falling off being due to the extreme cold weather, by which water pipes, springs, etc., were frozen up, causing a stoppage of the mills.

THE House Committee on Education and Labor have agreed to report a bill to distribute the proceeds of sales of public lands among the several States for the purpose of education. Details of the bill will be arranged by the Sub-Committee to whom the subject was referred.

THE railroad lines leading out of Chicago to the East report that they have shipped, the last week, to Eastern points, 53,000 tons of flour, grain and provisions. This represents 5,000 loaded cars. Trade is so active that on some lines a sufficient number of freight cars cannot be secured.

THE startling falling off in the revenues of the Government has been noticed by the Treasury officials within the past few weeks. The rate of decrease is such as to excite serious apprehension that if it continues, special legislation will be required to make provision for the current expenses of the Government.

A BILL introduced by Senator Eaton (by request), in furtherance of Civil Service reform, proposes to empower the President of the United States to detail for such duty as he may deem expedient retired officers of the army, navy and marine corps, who may apply to him for employment in the following branches of Civil Service, namely: Indian and Pension Bureaus, diplomatic service, life-saving service; said officers to receive while performing such duty the full pay and allowance of their rank, and no more.

THE Prince of Wales has entertained Stanley at dinner.

SOLEMN masses for the dead Pope have been held all over the country.

LARGE numbers of persons are still being fed at the churches in this city.

THE beet sugar refinery at Isleton has closed down for the season.

THE miners in the Savage mine can hear the blasts in the Suto tunnel.

CLAUDE BERNARD, the eminent French physiologist is dead.

GIDEON WELLES, ex-Secretary of the Navy, died at Hartford, Conn., on the 11th instant.

FOUR McPHERSON, Nebraska, was burned down on the 11th instant.

WM. WELSH, President of Girard college, died on Monday last.

SEVEN burglars were captured on Sunday, in a low grocery on Jessie street.

SOME 250 recruits for Gen. Miles' command have gone to Fort Buford and Tongue river.

THE building belonging to the Albany (N. Y.) Times was burned on Sunday. Loss, \$200,000.

THE President has appointed William A. Howard, of Michigan, Governor of Dakota.

STANLEY was entertained by the Royal Geographical Society on Saturday evening.

A PRISONER named Wallace walked out of the Municipal Court room of this city, this week, without being discovered.

MONTGOMERY QUEEN, of circus notoriety, has filed a petition in bankruptcy in New York. Liabilities, \$166,000; nominal assets, \$31,223.

A NUMBER of the overdue coasting vessels have arrived in port, after having experienced heavy gales. Several are yet to be heard from.

AN armed body of men prevented a delinquent tax sale in Steuben county, New York, on Monday.

NEARLY 1,400 free lunches were provided to the poor in the churches last Sunday. A great many families had food supplied to them at their homes also.

IN consequence of an urgent order received at Chatham Dock Yard, the whole force, numbering 4,000 men, will begin working extra hours to complete vessels in hand.

CRAIG, M. CONRAD, Member of Congress, United States Senator, and Secretary of War under President Fillmore, died in New Orleans on Monday, aged 73.

A SERIES of deep sea researches after the manner of the Challenger investigations, is to be instituted toward the close of next year, in the Bay of Bengal and the Indian ocean.

THE contested election case of Wiggington vs. Pacheco, has been decided by the House in favor of Wiggington, so that Pacheco has been unseated.

A STRONG tidal wave has swept the coast of Peru. The Callao mole has been severely damaged. There was not a ship at the guano deposits.

THE persons who became sureties for Knight, Wellock, Kearney and others, have been relieved of their obligations by Judge Fernal, who has allowed the accused to go on their own recognizance.

THE President has nominated Charles Silent, of California, to be United States Associate Justice of Arizona Territory, in place of Judge Tweed, whose term of four years is about to expire.

SENATOR PIERSON has introduced a bill appropriating \$25,000, to be used with a like sum donated by H. D. Bacon, for constructing on the State University grounds a Library and Art College.

NEWS from Cape Town says: A general advance was made against the enemy January 15th, which was completely successful. Ten thousand cattle and fifteen thousand sheep were captured. The Kaffirs lost heavily. Transkel is completely cleared of the enemy.

THE Postmaster-General has issued new rule. Postmasters for small towns and for country districts will hereafter be appointed on the recommendation of the Postmasters of the largest neighboring cities. Some Western Members of Congress feel indignant at this loss of patronage.

THE bill introduced in the House by Robertson, to improve navigation and to afford protection and security to shipping, trade, commerce and alluvial lands of the Mississippi river, provides for an appropriation of \$6,500,000 for that purpose.

UP to Saturday there have been introduced in this Congress 3,940 bills and joint resolutions, only ten of which have yet become laws. Four-fifths of them were introduced by members of the House, and of the entire number more than one-half are pensions and private relief bills.

SECRETARY SCHURZ has affirmed the decision of the General Land Office in the matter of survey of the Jarupa Rancho, comprising 39,000 acres of land in San Bernardino county, confirmed to Abel Stearns. This decision approves the recommendation made by the Surveyor-General last October, for the erection of southern and eastern boundaries.

THE Territorial Delegates have adopted this resolution: "That the Committee on Public Lands of the House of Representatives be respectfully requested to report House bill No. 2,442, introduced by Maginnis, of Montana, to regulate the cutting of timber on public lands in Territories, with a favorable recommendation, as, in our relief, said bill is well adapted to furnish such relief as the people of the Territories require; and that its passage ought not to be jeopardized by being attached to or connected with other proposed legislation about which there may exist serious differences of opinion."

Estimation of American Scientific Work Abroad.

The writer of the following letter was for some years connected with the Geological Survey of California under Prof. Whitney, and subsequently spent four years in the exploration of the interior of China. He is now President of the Royal Geographical Society of Berlin, Prussia, and deservedly ranks among the most eminent geographers and geologists of Europe.

F. V. Hayden, Esq., Chief of Geological and Geographical Survey of the Territories:—MY DEAR SIR: I have to thank you for so many of your splendid publications, which you so kindly have sent me during the last months, and which make me now the owner of nearly all that has been published of the "Survey of the Territories." Long ago I ought to have expressed you my most sincere thanks, but the saddest of family events have left me little time lately for either scientific work or correspondence, and I am in arrears with nearly everything.

I hope to be able some day or other to go with the necessary care through the wonderful amount of discovery, information and knowledge, which is stored up in your volumes. But the hasty perusal even, to which I had to restrict myself till now, has been to me the most lively interest. Since the time when I made some geological rambles on the Pacific coast, I have never ceased to follow with admiration, the course of your researches. Ten years have passed since. I was then well acquainted with the Sierra Nevada, and the eminent work of Prof. Whitney and his survey had extended some way beyond it. But I looked vainly for good and thorough information on the vast regions extending thence to the eastern slope of the Rocky mountains; for, notwithstanding the grand publications of the Pacific Railway expeditions, the backbone of the continent and the region adjoining it, which appeared to claim, geologically and geographically, a paramount interest, were then little more than a terra incognita.

But you had already commenced to lift the veil from the easternmost part of that region. I recollect with pleasure the interest with which I learned, first from Prof. Whitney, and then by some publication, your progress and your results. Yet I did little expect that within a decade, you would have unravelled the leading topographical and geological features of so many thousands of square miles, from the northern limits of the United States down to New Mexico. Your eminent exploring work, the energy with which you have conducted it, and your faculty of managing the working power of a large staff so as to arrive at its full efficiency, and to put every man at his proper place, have earned for you the admiration and praise of the scientific world in general, and many eminent men in particular. I hope you will allow me to join the number of these and, although my opinion may be of little weight, to give you my thanks, both as a geologist and geographer, for the immense addition to substantial knowledge, which we owe to your survey and to yourself as its skillful leader, and also to congratulate you to the uncommon merits which you have won for your own country.

You are, to be sure, in an enviable position in America, as compared with most countries of Europe, inasmuch as you have unknown and deeply interesting tracts of country, as it were, within doors. But it is one thing to enjoy these facilities, and another to bring them to account. I believe I am correct in the opinion that it is chiefly your merit to have given the impulse for the scientific exploration of these tracts of country which are lying back of the agricultural and long since settled regions, and it certainly is your merit to have enlisted for the execution of this grand enterprise a body of skillful men and proficient scholars. With their assistance your survey has probably brought wider regions into the realm of scientific knowledge than has ever been done before in any single case and in an equal space of time. Having gone over many thousand miles of untrodden ground myself, I am fully aware of the difference which there is between a hasty reconnaissance along certain lines and an efficient exploration which, on the basis of good topographical work, embraces all branches of natural history.

If I desire to express my profound admiration to yourself and your fellow-laborers for the untiring energy with which your work has been conducted, as well as for its wide scope and grand results, an equal homage is due to the enlightened government which has furnished, with an uncommon liberality, the means for carrying out the exploring work and for publishing its results in a magnificent style. As on so many previous occasions, it has given proof of its appreciation of the value and practical usefulness of science; and, indeed, the amount of money spent is small as compared with the advantages that have been gained.

In the interest of science at large, as well as in that of your great country, I hope that you will be enabled to continue your survey on an undiminished scale for a long time.

You will have received, some months ago, my first volume on China. I am looking forward with interest to the mode in which the Loess problem will be finally solved in your Territories, and whether you will approve my theory respecting it. Believe me, yours very truly,

B. V. RICHTOFEN.

Berlin, 36 Magdelburger strasse, Dec. 30th.

A Rain Gauge.

EDITORS PRESS:—What is a rain gauge? I measure the rain in a lard-tin. I had, during the storm of January 15th and 16th, fully six inches of water in it. The total for the season, to January 21st, was 9.90 inches.—W. PRIFFER, Saratoga, Santa Clara county.

Our correspondent's lard-tin will give a measure of the rainfall accurate enough for all practical purposes, although it is liable to some errors, because the vessel may not be exactly "true" in sides and bottom. According to exhaustive researches, carried on for 15 years, by Mr. Symons, of London, and summarized in Johnson's new encyclopedia, it appears that for a standard gauge, the collector may have any diameter from three inches up to three feet, but a diameter of eight inches is preferable. It must be of thin sheet metal and of cylindrical form and have its axis truly vertical. The mouth of the collector should be horizontal and not less than one foot nor more than three feet from the surface of the ground. A uniform height of one foot from the surface is preferred. Gauges set upon buildings are objectionable. According to Reclus, in his masterly work, "The Ocean," it has been ascertained that the quantity of water falling on the terrace of the Paris observatory building, at 91 feet high, is always less than the quantity of water collected in the courts situated below. At the summit of the building the annual depth of rain is 19.7 inches, while at the base the depth rises, on an average, to 22 inches. At Berlin, the quantities of rain which fell on the roof and in the court-yard of the observatory are a little less, but the difference is also about a ninth. Of course, this rule does not apply to great elevations, such as mountains, for they have altitude to enable them to condense the higher strata of clouds and secure the greater amount of water.

The water collected in a gauge should flow at once into a receiver or holder, with the least possible loss, and where it will be kept safe from evaporation and the quantity should be measured as soon as possible. Some gauges, placed in inaccessible places, are constructed so

THE LATEST FRAUD—THE "STONE MAN" OF COLORADO.

as to allow of measurement once each month. Either the weight, the volume or the depth of the collected water may be measured according to convenience. The usual method is to give only the depth in inches to which the ground is covered by the rain which fell thereon.

When snow falls it is considered best not only to melt and measure that which fell into the collector, but also to dip the inverted collecting cylinder into those places where the snow has fallen evenly and thus take up sections representing the average snow fall. By melting these and taking the average resulting quantity of water, we deduce a better result than could have been given by a single gauging.

Rain gauges should be placed at a distance from trees, fences, buildings or other local disturbing causes.

RICHMOND DISTRICT.—Richmond District is situated about 15 miles north of Palisade, in Eureka county. Regarding its prospects, the *Times-Review*, of a late date, has the following: J. C. Howerton, returned, a few days ago, from Richmond district, where he had been spending a week or two, looking after his mining interests there and taking a general survey of the country. He says there are about a dozen men living in the district, which was formerly known as Mud Springs. But little work has yet been done there, and, of course, nothing definite can be stated in regard to the merits of the mines, although, for the amount of prospecting done, the developments have been most favorable. Twenty-five feet is the greatest depth that has been reached on any of the ledges. The ore near the surface is carbonate and resembles the surface ores of Eureka district. The Aborigine mine, owned by Mr. Howerton, showed on top only a seam of about four or five inches of carbonate ore; but, at the depth of eight feet, has increased to over two feet of a well-defined ledge, a good portion of which is good milling ore.

WITH the exception of the Raymond & Ely, the Eureka Con. mine has produced more bullion than any other outside mine on the coast, and at the rate of the present yield will stand at the head of the list by the first of April.

THE total bullion yield of the Eureka Con. mine, from its discovery to the 31st of December, 1877, is \$8,379,574.

The Colorado Stone Man.

The true story of the Colorado stone man has just been revealed, and the whole thing turns out to be a fraud, like the Cardiff giant; in fact it was another sell-off exactly the same sort. This thing is becoming a trifle monotonous, and taken in connection with the deceptions lately practiced with the Indian mounds in Wisconsin, Iowa and elsewhere, shows a very bad state of affairs. Inscriptions have been manufactured on pieces of slate, and placed in different mounds, and afterwards being discovered have occasioned a great deal of wonder, scientific conjecture and self-delusion. The characters of such inscriptions are copied from Runic, Icelandic, Norse, Phœnician, Etruscan, Hebrew, Egyptian, etc. A recent find was a stone tablet in Wisconsin, written in Sanscrit, which is to be sent to the British museum. In Iowa also several cases of mound stuffings have been detected, and altogether the numerous frauds in American antiquities have resulted in so much skepticism that even *bona fide* discoveries are regarded with the greatest suspicion. In the case of this stone man, about which there was so much talk at the time of its exhibition in New York, the plan was carefully laid out and pretty skillfully executed.

It was made at Elkland, a little mountain town in northern Pennsylvania, by George Hull, the maker of the "Cardiff Giant." The facts were made known by E. J. Cox, Justice of the Peace at Hornellsville, on the Erie road, who had a financial interest in the humbug, but was so badly misused by Hull that he felt no longer under obligation to keep the matter secret. All of Cox's statements have been verified by a reporter who visited Elkland quite recently. It appears that Hull rented a farm at Elkland in 1873, and as soon as he was established he built an icehouse, as he called it, in which was constructed an arch kiln of brick. Ground stone,

ant, who was in Barnum's employ. They shipped the giant to Colorado Springs, and then reshipped it as local freight to Pueblo. Hull was absent about six weeks, and on his return said that the giant was successfully planted.

Conant went as a professor in charge of a party in search of geological specimens. He remained to watch the deposit. When Hull returned East he said the giant was just as ready to dig up them as it would be in five years, but that Barnum had gone to Europe and would not be back till August. The lifting of the giant was therefore delayed until Barnum's return, when he went to Colorado, ostensibly to look after his stock farm, and lecture on temperance. His real object was to be near at hand when the giant was exhumed. Hull knew it would never do to have the Cardiff giant man recognized as having anything to do with the Colorado giant; so he assumed the name of George H. Davis, cut his hair short, shaved his mustache, put a hump on his back, and disguised himself as a stoop-shouldered farmer. Cox meantime was getting anxious to know what share of the financial harvest he was to reap, but he could obtain only vague promises from Hull. To make the sale to Barnum, Hull had been compelled to conceal from the showman Cox's knowledge and interest. Cox told Hull he would have his pay or he would talk. Hull returned to Colorado, but the necessity of keeping Cox quiet soon brought him back, and he then conciliated Cox by offering him one twenty-sixth of his own interest. A contract was drawn up to this effect, and Hull then returned to Colorado. When he reached Pueblo he found that Conant, who, as he expressed it, had been fooling with the giant, had broken off the head and one leg. Hull was enraged, and a quarrel ensued. However, the giant was skillfully mended, and the discovery was made according to the plan. Barnum appeared on the ground and offered \$20,000 for the find, which Conant refused with scorn. The people began to laugh at Barnum, and he offered a reward of \$10,000 to any man who would prove that the giant was made by chisel. Then came the test. Barnum paid Prof. Taylor \$100 and his expenses to go out and bore into the giant.

Hull had lent an attentive ear to the talk of scientific men, and was astonished to learn that a kind of crystal ought to be found on boring into the arm of the petrified giant. Hull obtained crystal to correspond, and by sleight of hand exchanged it for the dust of the boring implement, which was first handed to him by Prof. Taylor. When the giant arrived at Quincy, Illinois, Barnum, who was then in Washington, ordered it to be brought to New York, and its subsequent history is known. Cox has received no share of the proceeds of the exhibition, and decided on that account to make his knowledge public.

The enterprise has been a losing one all around, and much surprise is expressed that Barnum should involve himself in this worn-out scheme of humbuggery. The giant was exhibited in New York, at the aquarium for several weeks, but it failed to draw. Conant has gone back to Colorado, presumably in search of other fossils. The giant is now stored among the curiosities of the New York Museum of Anatomy.

Arizona's Prospects.

Arizona is now looked upon as the future great geographical division of our free and immense Republic. And why? Because she is young, rich and open to all who are looking for something new—some opening for business, some "work for idle hands to do." It is known, all over the Union, that Arizona is the possessor of inexhaustible supplies of the precious metals; that through her rich territory more than one transcontinental railroad is, ere long, likely to be built; that, when railroads are built, the trade of a large portion of Mexico will center here. Not alone this: the people of Colorado, California, Utah, New Mexico and a portion of Nevada will be drawn towards the great cities that are sure to grow up here, on or near the line of the grand trunk railroads which are to be. Then will the rich valleys of the Colorado, the Gila, Salt and other rivers be devoted to the production of cotton, corn, oil, wine and fruits of every description; then will her vast forests, her gold, silver, copper, salt, coal and other mines be utilized. Her pastoral lands will then team with millions of domestic animals, while along her streams, factories will be erected and run, making and fabricating almost everything under the sun.

This is no fancy picture, no idle or imaginary dream. The Territory has once borne and supported millions of people and can do so again. The ancient ruins of cities, villages, waterways—traces of once powerful and busy hives of human workers—that are found here and there throughout the Territory, give good proof of these assertions, if other proofs than these already cited were wanted.

Scarcely 15 years have passed since Captain Walker (peace to his ashes), at the head of a few companions, entered the Arizona wilderness, and, like the immortal Cortes and his brave followers, founded the first white settlement here and planted a new civilization, which grew and flourished even when beset by savage foes and neglected by the very Government and people who should have maintained and defended it. The story of the horrors through which the pioneers of this Territory passed is still fresh in the minds of millions of Americans, so we will not repeat it.—*Arizona Enterprise*.

Continued from page 98

the total sum of such purchases and sales.

Monthly Settlement of Controller.

Sec. 19. The State Controller shall make a settlement each month, and as early in the month as possible, with the Mining Commissioner, as required by the Political Code in other cases; and thereupon the Mining Commissioner shall pay over to the State Treasurer all moneys received by him for fees, brokers' percentages and from all sources, to be credited to the General Fund.

Right to Sue.

Sec. 20. Any Board, Exchange or association of brokers, or any person engaged as a broker in buying and selling mining stocks, who may neglect or refuse to furnish to the Mining Commissioner the reports required by sections 17 and 18 of this Act, shall forfeit the sum of \$1,000 for each and every such offense; and it shall be the duty of the Commissioner to institute proceedings forthwith, in any Court of competent jurisdiction, to recover said sum, together with all percentages that may be due from the delinquent party.

Power to Investigate.

Sec. 21. The Commissioner shall have power to investigate all charges of corrupt mismanagement of mining corporations upon the complaint of two or more stockholders; or if he deem the case one of great public concern he may of his own motion make such investigation. It shall be his duty also to investigate all violations of the provisions of this Act that may come to his knowledge, and report those of a criminal nature to the next Grand Jury, in all cases where there is probable cause of guilt. For this purpose he shall have power to send for persons and papers, and to issue subpoenas in accordance with section 599 of the Political Code.

Complete Record.

Sec. 22. The Commissioner must keep and preserve a full and complete record, in a permanent form, of all his proceedings, including a concise statement of all investigations into offenses committed in violation of this Act, and of all examinations of mining properties, or of the books and papers of any corporation.

Payment of Fees.

Sec. 23. The Commissioner shall require to be paid immediately, before the filing of any paper, the following fees in U. S. gold coin:

1. For filing articles of incorporation or other similar document, \$10.
2. For filing the annual statement of any corporation, \$10.
3. For filing any other paper required to be filed by this Act, \$1; provided, the printed statement required to be filed by section 17 of this Act shall be filed without charge.
4. For certifying a copy of any paper, \$1.
5. For administering oaths, \$1.
6. For furnishing copies of documents, 20 cents per folio.

Sec. 24. The Commissioner shall have power to administer and certify oaths for all the purposes of this Act. He shall provide his office with a suitable seal.

Rooms and Furniture.

Sec. 25. The Commissioner may procure rooms for his office, and may provide a suitable safe and furniture therefor. He may also provide stationery, postage, fuel and other conveniences necessary for the transaction of the business of his office. All expenditures authorized in this section shall be audited by the Board of Examiners, and paid out of the general fund. The Board shall allow the expenses of the Commissioner incurred in necessary traveling in the discharge of his official duties, and also the necessary expenses of the investigations required by this Act, upon itemized accounts, duly verified.

Salary of Commissioner.

Sec. 26. The annual salary of the Mining Commissioner is \$5,000. He shall have power to appoint a Secretary, whose annual salary is \$3,000. The Secretary shall furnish such bonds as may be required by the Commissioner, and shall have power to administer and certify oaths. The Commissioner shall also have power to appoint a porter and messenger, whose salary is \$1,200.

Attorney and Counselor.

Sec. 27. The Governor shall, within 30 days after the passage of this Act, appoint an Attorney and Counselor for the Mining Commissioner, who shall be a lawyer in good standing, and who shall receive as compensation an annual salary of \$4,000.

Penalties.

Sec. 28. Any corrupt violation of the provisions of this Act, or any corrupt omission to perform any duty herein required to be performed by the Mining Commissioner, the Secretary, or Attorney and Counselor, shall be deemed a felony, and shall be punished by imprisonment in the State prison for a term not less than one nor more than 10 years, and the offender so offending shall ever after be ineligible to any office of trust or profit in this State.

False Swearing in Returns a Perjury.

Sec. 29. False swearing in any required return or other paper required by this Act, and sworn to in pursuance of its requirements, shall constitute perjury and be punishable accordingly.

Sec. 30. All Acts and parts of Acts in conflict with this Act are hereby repealed.

Sec. 31. This Act shall take effect from and after its passage.

USEFUL INFORMATION.

A Chance for Our Industries in Australia.

The Australian International Exhibition of 1879, seems likely to be of considerable importance. This will be especially true to those engaged in the industries of this coast, for Australia is a thriving trade-neighbor of ours. We should by all means show her what fine manufactures and productions we can furnish to her. Australian papers state that arrangements are in progress for the International Exhibition proposed to be held in Melbourne in 1879, and the scheme has the approval of the Legislative Assembly. The Governor, speaking recently at Stawell, said that the proposal could not fairly be described in any quarter as premature, if regard were had for the wonderful progress which the Australian colonies have already achieved. In 1879 the aggregate public revenue of the several Australian colonies will exceed sixteen millions sterling, while their trade, including exports and imports, will amount to nearly ninety millions in value. In other words, Australasia, as a whole, could already take her place among the 10 or 12 great nations of the world in point of value of their trade and general importance, for there are only seven or eight nations with a larger public revenue than sixteen millions. The three powerful colonies of Victoria, New South Wales and New Zealand have each a revenue and trade which would place them on a higher scale than ancient European kingdoms, like Sweden, Denmark, and Saxony. The single colony of Victoria, with its yearly revenue of four and one-half millions, is already equal in wealth and importance to the kingdom of Portugal, while Melbourne is considerably above Lisbon in wealth and trade. The success of the exhibition, he pointed out, would depend in a great measure upon the cordial co-operation of the mother country and the sister colonies of Australasia. His Excellency further stated that he was in correspondence with the Secretary of State for the colonies, who was anxious to give every possible assistance, and that the presence of the Prince of Wales was all that was needed to render the exhibition a triumphant success. He expressed himself confident that his Royal Highness, if invited by both Houses of Parliament, might be induced to come out to open the exhibition, and he was certain he would be received with enthusiasm.

PROTECTING METALLIC SURFACES.—The treatment of metallic surfaces so as to render them less susceptible to atmospheric and other influences capable of affecting them, has recently been receiving the attention of Mr. George Bower, of St. Neots, Hunts., and he has found that he can attain the desired end by forming a protective film or coating upon the surface of metallic objects by the employment of air or oxygen, or of a mixture of them at an elevated temperature. The metallic objects or metallic surfaces which it is intended to submit to the protecting process are either subjected to heat in a retort chamber or other apparatus which is capable of being heated externally, and also of being wholly or partially closed, and to such retort chamber or apparatus a tube or tubes is or are adapted, in order that air or oxygen, or mixtures of the same, may be allowed to pass over, in, and among the objects contained therein at any desired pressure; or, instead of causing the apparatus to be heated externally, he employs a heated current of air or of oxygen, or of an oxidizing agent composed of mixtures of the same, heated to such an extent as that the objects contained in the apparatus shall become oxidized, and thus become coated with a protective film or covering; or the apparatus containing the objects to be treated may be heated externally, and the before-mentioned oxidizing agents be admitted at the ordinary temperature of the atmosphere. The temperature which he has found to give the best results ranges from a dull to a bright-red heat, whether the objects be heated by the external application of heat, or by the internal application of the heated oxidizing agent. The process is equally applicable to all kinds of iron and steel, and to any combination of them. The operation is continued until a protective film or covering of the desired thickness shall have been formed, and upon the objects being then allowed to cool they are ready for useful application in the arts.

RULES FOR ASCERTAINING REVOLUTIONS OF GEARING.—To ascertain the revolutions of gearing: Rule—Multiply the number of cogs in the driver by its number of revolutions and divide the product by the number of cogs in the driven; the quotient will be the number of revolutions of the driven. To ascertain the number of cogs in the driver, the number of its revolutions and the number of cogs and revolutions of the driven being known: Rule—Multiply the number of cogs in the driven by the number of its revolutions and divide the product by the number of revolutions of the driver; the quotient will be the number of cogs in the driver. So, vice versa, to find the number of cogs in the driven, its required revolutions being given. To ascertain the diameter of cog gearing: Rule—Multiply the number of cogs by the number of thirty-seconds of an inch in the pitch. Example—A pitch of two inches has 64 thirty-seconds of an inch; say the wheel has 120 cogs, 120 x 64 gives 7680 (76 inches and 80-100 of an inch) inches, the exact diameter on the pitch line.

A SUBSTITUTE FOR GUTTA-PERCHA.—The *Polytechnic* says that balata is a new product which has been lately imported as a substitute for gutta-percha. It is the hardened resin of the so-called Bully tree, found on the banks of the Amazon and Orinoco. Each of these trees yield from one-third to one-half kilograms of balata each year. This substance is so similar in appearance and properties to gutta-percha that it is often imported as such. It is tasteless, has the same smell as gutta-percha when warmed, has the same leather-like toughness, but is far more elastic. At 50° C. it becomes plastic and melts at 150° C., hence at a higher temperature than gutta-percha. It is partly soluble in pure alcohol and ether, but completely soluble in warmed turpentine and in benzol and carbon disulphide even when cold. It becomes strongly electrified when rubbed and is a better insulator for heat and cold than gutta-percha and will doubtless soon find an important application in electrolysis. The caustic alkalis and concentrated hydrochloric acid have no action upon the balata, but warmed concentrated nitric and sulphuric acids have the same violent action upon it as upon gutta-percha.

SUGAR BEET VINEGAR.—A writer in the *American Cultivator* says: I do not see any mention made of the value of the juice of sugar beets for the purposes of vinegar. One bushel sugar beets, properly rasped and pressed, will yield five gallons of juice, which, treated the same as cider is, will make a stronger vinegar, of as good but different flavor; and in making cider, one bushel of sugar beets to nine bushels of apples will make a cider superior to apples alone. Every farmer who can raise sugar beets, rasp and press them, will have juice enough to make all the vinegar he needs for his own use and a surplus for sale, and be independent of the off-years for apples in the supply of vinegar. With vinegar at a price it could be made for from beets, its consumption would be increased, as it would enter into many articles of manufacture from which the price now precludes it. When it is found how cheap sugar beets can be raised, and their value for vinegar and food, also their leaves for stock, they will be grown more and then be as staple an article in the market as corn.

VARNISH PUTTY.—Varnish putty, for filling the pores of the wood after the first coat of priming, is made of quick-drying varnish and Paris white; the addition of a little ochre improves it for rubbing down. First-class varnishes stain more easily than the inferior grades. Slight stains may be removed by rubbing the spot with rotten stone and water, and, after thoroughly drying the part, rubbing it with sweet oil, applied by the hand.

GOOD HEALTH.

Boys' Smoking.

Whatever may be said for or against the moderate use of tobacco by adults, says the *Glasgow Times*, there cannot be any question about its prejudicial effect on unformed constitutions. It is, therefore, of public importance that the growing disposition among boys to indulge in "the fragrant weed," even at the cost of nicotine sickness, should meet with every opposition. A Liverpoolian, however, recommends such very summary proceedings under this head, in a letter to a local journal, that one might well ask whether the cure would not be worse than the disease. Having occasion to frequently cross the Mersey, he has noticed that the troops of schoolboys making the voyage during the afternoon generally "sneak into the back of the smoking cabin and at once light their pipes." The simple truth is that the lads who have once acquired a taste for smoking will be sure to gratify it surreptitiously in one way or another. Hence the necessity of striving by every means to prevent the formation of the habit. A great deal might be done in this direction by parents and schoolmasters if they convince the boys that the use of tobacco in early years acts prejudicially on physical strength. This is a point that comes home to them at once. Every English lad wishes to be strong, and if it can only be impressed upon him that smoking will make him a stunted weakling, he will be more likely to steer clear of the habit than if high moral considerations were brought forward.

EUCALYPTUS AS A CURE FOR RHEUMATISM.—*Russian River Flag*: Anson Goodspeed, of this city, was some time since afflicted with inflammatory rheumatism. One ankle and foot swelled to nearly twice their natural size, were exceedingly inflamed and very painful, and he could not use the other limb at all. Mrs. Goodspeed procured some eucalyptus leaves, rubbed them together a little, and without further preparation bound them on in good quantity, renewing every hour and a half or two hours, as the fever rendered them dry. In 12 hours he was much easier and in 24 hours the limb could be used. This was the speediest relief Mr. Goodspeed had experienced in the many times that he had been afflicted with the same disease. A physician from San Francisco at this time informed Mr. Goodspeed, that, knowing the excellent medicinal qualities of these leaves, he had already prepared at least half a ton for shipment to the East for medicinal purposes.

Conditions of Health in Rural Homes

In a recent lecture, Prof. Kedzie said: Much depends upon the site for a house. Choose for the site some gentle swell of ground, not a hill, which you must wearily climb. Let the ground flow off with a gentle declination to the south or southeast; avoid swamps and low land. The soil should be free from stagnant water with a dry sub-soil, and the soil must be free from such water to a depth of at least six feet. The house should face the south or southeast. The living rooms should be on the eastern side of the house, because this receives the first sunlight in the morning and is in the shade in the afternoon. In summer the mornings are often chilly and the afternoons very hot. The usual materials for building in New York were wood and brick. He thought a brick house afforded better conditions of health because its walls are more permeable by air. By suitable arrangements you can blow through a solid, dry brick, but wet a brick, and the passage is arrested. Brick absorbs moisture and expels air, and such brick, when dry, contains about three-fourths of a pint of air; if a dry brick can hold so much air, it can permit air to slowly breathe through it. Wall paper is not conducive to health, because it is impervious to air. Wood is permeable by air in the direction of the grain, and some kinds of wood very readily permit the passage of air from end to end, but the air does not readily pass through laterally. He advised all to make walls secure against rats and mice, and this might be accomplished by bringing forward one course of brick so as to touch the baseboard all round: the rodents could not then get through. If wood is used let in a piece of scantling between the studs all around at the top and bottom, and lay a tight course of brick and mortar on the top of these pieces of scantling. He advised not to build any half stories, and, if it was possible, to have a good fireplace in the living-room, and use it. No inanimate thing in the house is so cheerful as an open fire. Ventilate your houses, first, because there is plenty of raw material for this purpose; and second, because it is necessary for health. Air once breathed is unfit to breathe again, and should be turned out of the house. Nature has given every one a nose by which to detect impure air. Every house should have some plan of ventilation, however poor. Cellars also should be ventilated. Here lies in ambush diphtheria and membranous croup, the disasters of childhood, and typhoid fever, that strikes at all ages. Do not expect to preserve health over such a charnel house. Let in the sunlight. No plant so much as man demands light and air. A good supply of pure water is a fountain of life in any household. To test water fill a perfectly clean quart bottle two-thirds full of water, dissolve in this a teaspoonful of clean white sugar, cork the bottle, and put it away in some warm place for two days, and if it remains clear and bright you need fear no evil from its use; but if it turns milky white and gives off an offensive smell, beware how you use it. Do not throw out of doors or windows slops to fester and rot, filling the house with flies and foul vapors.

PREVENTABLE DISEASES.—In the report of the San Francisco Board of Health, made last week, occurs the following paragraph: More than one-fourth of the deaths are due to diseases that would hardly exist under proper sanitary surroundings. Diphtheria and typhus fever are closely connected with bad drainage, while measles, scarlet fever, cholera infantum, dysentery and other diseases would be of far less frequent occurrence with a proper system of drainage. Last summer, attention was called to a neighborhood in the northern part of the city, which seemed to have more than its share of illness. There was diphtheria and typhoid fever, although the locality was situated on high ground, from which the descent was steep and in which a new sewer had been recently laid. But a property owner had put in a small wooden drain leading from his house to the cesspool at the corner of the street. It was placed just below the surface of the ground and was not provided with a proper outlet. The consequence was that the soil became more or less saturated with matter from this drain and sickness ensued. One property owner, whose family was nearly prostrated by a low form of typhoid fever, had called again and again upon the Superintendent of Streets to give some relief, but the little drain was not thought to be the cause of the trouble and was left undisturbed. The result was that the family determined to sell their house at a sacrifice and move away. The whole neighborhood felt the depressing effects of the vitiated air and diphtheria entered into many families in the vicinity. The effect of bad drainage is seen not only in the diseases that are due directly to it, but in the lowering of the tone of health and the marked predisposition to general diseases. Its effects are widespread, and yet the great number of deaths from diseases of a zymotic character could be easily reduced by simple attention to sanitary laws and especially to drainage.

CONTAMINATION OF AIR BY CESSPOOLS.—The *Chemical News* contains a statement of Dr. F. Frismann that 18 cubic meters of excrement, as found in cesspools, will give off per day 18.79 cubic meters of irrespirable gases, proportioned as follows, viz.: Carbonic acid, 11.144 kilos; ammonia, 2.040 kilos; sulphuretted hydrogen, 0.033 kilos; carburetted hydrogen, 7.464 kilos. He considers copperas and sulphuric acid as among the best disinfectants for cesspools.

SAN FRANCISCO:

Saturday Morning, Feb. 16, 1878.

TABLE OF CONTENTS.

ILLUSTRATIONS.—A Two-Headed Snake found in Santa Clara Co., 97. The Latest Fraud, 102. The Defiance Mill of Sierra Plume and Lumber Co., 105.

GENERAL EDITORIALS.—Fancy Mining Companies; Woodville Con. vs Woodville; A Very Wonderful Freak of Nature, 97. Our Visit to the Redding Ranch; The Sierra Plume and Lumber Co.; Legislative Topics; New Incorporations, 105. The Week; Our Useful Metals and Minerals; Foundry Notes, 104. Patents and Inventions; Notices of Recent Patents, 109.

MINING SUMMARY from the various counties of California, Nevada, Arizona Oregon, Utah and Idaho, 100-101.

MINING STOCK MARKET.—Sales at the San Francisco, Pacific and California Stock Boards. Notices of Assessments, Meetings and Dividends, 108.

CORRESPONDENCE.—The Mokelumne Ditch and Irrigation Co.'s Dam, 98. The New Mining Bill, 98-103.

MECHANICAL PROGRESS.—Hints for Testing Lathes; A New Type Setting Machine; The Electric Light in a Work Shop; Fire-Proof Building; Utilizing Water Power to Compress Air; Manufacture of Ferro-Manganese in France; Glass Type; The Export of Toys; Pneumatic Clocks, 99.

SCIENTIFIC PROGRESS.—Poisoned Arrows; Philosophy of Spontaneous Combustion; Microscopical Society; The Liquefaction of the Gases; Museums as Useful Institutions; Presence of Bronze in Coal Gas, 99.

USEFUL INFORMATION.—A Chance for Our Industries in Australia; Protecting Metallic Surfaces; Rules for Ascertaining Revolutions of Gearing; A Substitute for Gutta-Percha; Sugar Beet Vinegar; Varnish Putty, 103.

GOOD HEALTH.—Boys' Smoking; Eucalyptus as a Cure for Rheumatism; Conditions of Health in Rural Homes; Preventable Diseases; Contamination of Air by Cesspools, 103.

MISCELLANEOUS.—Estimation of American Scientific Work Abroad; A Rain Gauge; Richmond District; The Colorado Stone Man; Arizona's Prospects, 102.

NEW ADVERTISEMENTS.

The White Patent Roasting Furnace, Pacific Iron Works, S. F.; Coal Oil Stoves, Weister & Co., S. F.; Henry Sewell, Mining Engineer, S. F.; The San Francisco Law Journal, Bagget, Scofield & Co., S. F.; Assessment Notice—Welch Con, Quicksilver Mining Co.

The Week.

Still the rain storms continue, and the farmers are commencing to cry out, "Hold, enough!" but the miners in the upper counties are rejoicing and using every drop of water that runs. In some places snow has banked up the ditches and caused some inconvenience, but as a general thing, now that the ground is well soaked, the reservoirs are filling, the ditches and flumes running full, and the hydraulic miners are hard at work. There is danger of some damage by flood along the Sacramento river, and the city of Sacramento, the lower part partially flooded, will be in a bad fix in case the American river rises much. Below the city a large tract of country is under water, and a great deal of the reclaimed tule land lower down has been flooded by seepage or breaking of levees. On Tuesday night and Wednesday morning we were visited with the most severe southwest wind we have had here for years, and although little damage was done in the harbor, we will probably hear shortly of disasters on the coast. All the vessels which have arrived lately have been severely handled, and some have been as long as 42 days coming from Puget Sound. Several have not been heard from for a month. So far, this winter has been the stormiest for many years, although the earlier part was quite mild. We need never fear a dry winter again until January has passed without rain. About 22 inches have fallen at this point so far, and it does not look now as if it would stop raining for some time to come.

Our Useful Metals and Minerals.

Besides gold and silver producing mines, we have on this coast, the useful metals and minerals in great variety and large supply. Concerning these not much is said, because, with the exception of four or five, very little has as yet been done towards rendering them practically available. Our coal, copper, quicksilver, lead, salt and borax have been somewhat extensively utilized, and efforts are about being made to test on a larger scale than heretofore, the commercial value of our sulphur and petroleum deposits. Iron, antimony, manganese, chrome, graphite, gypsum, the natural pigments, the useful clays and earths, slates and marbles we have in great abundance. Mica and asbestos have been found on the coast, also a little tin with some fine and a few precious stones.

Copper.

Of this mineral our heaviest deposits have been found at Mount Diablo, Contra Costa county; about Coos Bay, in Oregon; near the shores of Puget sound; in Utah and Wyoming Territories. Lignite, forming a very good fuel for domestic purposes, and for the generating of steam, has been found at a great many places in California, as well also as in nearly all the other Pacific States and Territories. The receipts of coal from domestic sources at the port of San Francisco during the year 1877, amounted to 346,341 tons, of which there were received from the Mount Diablo mines, 96,172 tons; from Coos Bay, 30,941; from Bellingham bay, 10,475; from Vancouver island, 102,421; from Seattle, 102,333; from the Rocky mountain mines, 133; from Ione, Amador county, 3,458; from Oxnard, 190; from Buckeye, 41; and from Carbondale, 177 tons. Besides these we received from Chile 8,145 tons; from Australia, 100,513; from England, 89,362, and from Pennsylvania, 32,399 tons, the total receipts for the year from all quarters having aggregated 531,000 tons. The value of the coal extracted from the mines on this coast amounted to fully \$2,500,000, a sum that must rapidly increase with the enlarged product from this source hereafter.

Copper.

Cupiferous ores are widely diffused over the Pacific coast. Owing, however, to the low prices of copper, not much has been done of late towards working this class of deposits. Some five or six hundred tons of ore have lately been shipped from the Eagle mine, Quail hill, Calaveras county, where the developments are said to be very promising. The English company operating at Battle Mountain, Nevada, have done comparatively little during the year, though they might easily take out a large quantity of ore, and would, no doubt, do so under a more lively demand for this metal. The value of the copper ore shipped, hence, does not amount probably to more than two or three hundred dollars for the entire year. A very valuable find of this ore is reported to have been made within the past few months at a point near the Eagle mine, this ore carrying, according to numerous assays made in this city, from 20 to 50 per cent. of copper, and from \$100 to \$150 in silver to the ton. With only a slight improvement in the market, this industry would at once spring into life again throughout nearly all our Pacific States and Territories.

Quicksilver.

Scarcely any one of our mining interests has suffered more of late from depressed prices than this, which, from a very flourishing condition two years ago, has fallen into an almost profitless estate; and this not because there has been any abatement in the demand, but simply in consequence of a slight over-production on this coast. If, when the market began to decline, our mine owners could have managed, through concerted action, to restrict their annual production to the extent of eight or ten thousand flasks, prices might have been maintained, if not at the very highest figure, certainly at rates that would have proved fairly remunerative.

The California product of this metal last year amounted to 78,600 flasks, against 75,074 the year before, and this, notwithstanding some of the larger companies curtailed operations considerably, while many of the smaller ones ceased altogether. Some of the larger companies are now moving with a view to forming such a combination as will insure an advance of prices through a lessened production. Whether such an arrangement is feasible with many is a question, but certain it is prices cannot appreciate if a few of the leading companies continue to turn out this metal at the rate they have been doing of late, the New Almaden having made last year over 24,000 flasks, while the Sulphur Banks made nearly 12,000 and the Redington nearly 10,000 flasks. Without some concerted measures being taken to check production, the yield of quicksilver for the present year promises to be even larger than last. Of the quantity made in 1877, 46,280 flasks, valued at \$1,635,310, were exported to foreign countries, 31,210 flasks having been sent to China. Total value about \$3,000,000. Retail price of this metal varies at present from 43 cents to 45 cents per pound.

Lead.

The extreme low prices ruling for this metal has tended to restrict its production in the far west, more especially in Utah and Colorado, where much dependence is placed upon it as an auxiliary in helping to defray the expenses of reducing the argentiferous galena and other lead-silver bearing ores. Many furnaces re-

mained idle in these Territories last year, because of the low price of lead, and without some improvement in the market they will be likely to continue so the present year. The wholesale price of lead in this market at the present time is 5@5½ cents for pig; 6½ for bar, and 9 for sheet. The entire production of lead in the U. S. last year is estimated at about 70,000 tons, being fully 10,000 tons in excess of the yield for the preceding year. Of the above quantity five-sixths were made in Colorado, Utah Nevada and other Pacific States and Territories. The Selby Smelting Works, in this city, turned out in 1877, about 6,000 tons of pig lead, of this, 500 tons were shipped to China, and 3,000 to New York, the rest being consumed here. The Richmond Consolidated mines at Eureka, Nev., turned out last year something over 5,000 tons of pig lead, the most of which was shipped to New York. The Eureka Consolidated mine at the same place produced a still larger quantity, the most of which was consigned to the same market in the shape of crude bullion, the Richmond company separating the lead from the silver at their mine. It is expected that a much larger proportion of the lead from these mines will this year find its way to San Francisco, than has heretofore been the case. It is also probable that our receipts of this metal from Arizona and the mines of Inyo county, California, will be larger the present year than they were last.

Borax.

The prices of this commodity, like those of lead, have been much depressed the past year, causing all the companies, except those enjoying especial advantages for production, to retire from the field. These low prices have tended, however, to stimulate consumption and even created new uses for this valuable salt, compensating to some extent for the prevailing low prices. The total amount of borax made on this coast last year reached 4,254,209 pounds, being over 1,000,000 pounds less than was produced the year before. Of the above quantity, Smith Bros., at Teal's Marsh, Nevada, and the Riddell Company in the State range, San Bernardino county, Cal., produced each about 2,000,000 pounds, the balance being mostly made by Dodge & Co. at the latter locality. The Riddell Company, which possesses great natural facilities for making this salt, have lately added largely to their extensive works at their marsh, where they now refine their entire product, making an article not inferior to any coming on the market. The efforts made to manufacture boracic acid in this city, from the borate of lime brought here from the Nevada marshes, having been found unprofitable, has been discontinued. As the deposits of the crude material are not likely to prove as extensive as was at first supposed, the manufacture of borax on this coast will probably continue to diminish hereafter causing a corresponding advance in price. At the rate the several companies have been manufacturing for several years past, these deposits are being rapidly depleted, and only in a few localities do they tend to reproduce themselves to any great extent.

Sulphur.

From the sulphur deposits in Humboldt county, Nevada, there were extracted last year about 1,000 tons of refined sulphur, which found a market in this city. As the companies owning these deposits have greatly enlarged and improved their reduction works and otherwise increased their facilities for turning out this mineral, it is expected that the above quantity will in the course of a few months be doubled, and that they will very soon be able to supply the entire demand of this market, which calls for about 3,000 tons yearly. The Humboldt is fully equal to the best imported article, being in fact, as it comes from the companies works, chemically pure.

Petroleum.

In several of the southerly counties of this State favorable indications of the presence of deposits of the earth oils are met with. Lately borings at numerous points have been undertaken, some of which have already resulted in obtaining a good flow of oil, while others promise at least a moderate success. Among the exploiters of these deposits the Star company operating in Los Angeles county would up to this time seem to have met with the greatest encouragement, having developed five producing wells, two of which are flowing. They have erected refineries and are turning out an excellent quality of illuminating and lubricating oil, and claim that they will be able in a short time to supply the local trade in those articles. Of the 13,500,000 barrels of crude oil produced in the United States last year, California is credited with 73,000 barrels.

BULLION SHIPMENTS.—Since our last issue shipments of bullion from the prominent mines have been as follows: Northern Belle, Feb. 4th, \$2,220.41; Emigrant M. Co., total for January, \$6,150; Sheldon, total for January, \$1,000; Manhattan, 6th, \$7,939.88; Tybo Con., 4th, \$9,132.40; Northern Belle, 6th, \$3,019.20; Standard, 6th, \$18,163.39; Con. Virginia, 7th, \$188,694.66; Alps, 11th, \$1,967; Endowment, 11th, \$2,300; Eagle, 10th, \$1,700; Grand Prize, 11th, \$22,600; Arizona, \$1,743.36; Tybo Con., 8th, \$10,023.70; Alps, 12th, \$1,998; Northern Belle, 9th, \$3,016.43.

The first entertainment of the Washington Camp, No. 1, Patriotic Order Sons of America, will take place Thursday evening, 909½ Market street, on February 21st. We acknowledge receipt of an invitation.

Foundry Notes.

The Fulton Iron Works.

The Fulton Iron Works, Fremont street, is now one of the four large foundries of this city, having facilities for doing any kind of work in their line without depending on other shops. A change in the firm was made a few months since, by which the old Fulton works and McAfee & Spiers Boiler Works became one institution, the new firm being Hinckley, Spiers & Hayes. Before that time the Fulton works made no boilers, but this department is now added, so that the works are now capable of doing machine, foundry, blacksmith and boiler work, and in fact anything in this line. The boiler making department fronts on Howard street, comprising the old shops of McAfee & Spiers, and the foundry and machine department fronts on Fremont as before. The buildings are all connected and the fronts have been repainted, new machinery has been added of the latest patterns, and heavier than that previously used, so that now the Fulton is one of our first-class foundries. Mr. Hayes, who has long been identified with the Fulton, is now one of the partners, and Mr. Spiers, of the old firm of McAfee & Spiers has charge of the boiler department. He has made this a special study for many years, and devotes his whole time to it. Mr. Hinckley is well-known as one of the proprietors of the Fulton works for a number of years. They have at work now about 150 men, and in busier times employ over 200, as occasion demands.

The largest work in the shop at present is the boilers, machinery, etc., for the Newton hydraulic dredge. The machinery consists of two vacuum cylinders placed on the front end of a scow, each having a capacity of about 100 cubic feet. They are connected by a cross-pipe, from which depends the suction-pipe, which is capable of being lengthened or shortened, according to depth of water. The large air chamber over the suction-pipe is 10 feet high and 40 inches in diameter. The suction-pipe is 24 inches in diameter and is made telescopic, so as to admit of being lengthened or shortened at will. Steam is forced into the vacuum cylinders (of a capacity of about 100 feet each) from the exhaust of the Blake pump, under a pressure of about seven and a half pounds, or it may be taken from the boilers under a pressure of 100 pounds, according to the work to be performed. The machine may be described as a gigantic pump, and the steam acts as a piston one way, driving the air out, and by its sudden condensation the vacuum is formed. Everything with which the suction-pipe is in contact is then elevated, this action being assisted by jets of water forced against the material from above by means of a Blake pump. These jets act like streams against a bank in hydraulic mining, except that they are under water. A cubic foot of granite weighs about 160 pounds, and to this is applied a lifting power of about 1,050 pounds, an example showing what the machine is expected to accomplish. One of these, recently built, will be in operation in a few days to work submerged placers on Dry creek, Colorado; another is being built to go to Brazil for the same purpose. They are just commencing to build one here, also, for mining on the Feather river. Mr. G. W. Cummings, Superintendent of the Newton hydraulic dredging and mining company, is the one who brought this dredge to the attention of the public on this coast.

The scow on which the machinery described is to be placed, was built at Oakland by Simpson Bros. No less than 82,000 feet of lumber have been used on the hull alone. The Blake pump was furnished by H. P. Gregory & Co., agents in this city, who had it made to order at the factory. This is a duplex Blake pump, and weighs 11 tons, the largest one of the kind ever brought to this coast. It came, all set up, on a car from the East. The steam cylinder is 24 inches in diameter, valve cylinder 12 inches, and stroke 24 inches. The capacity is 100,000 gallons per hour at ordinary speed. It is intended to project the water from the nozzles at a speed of about 250 feet per second.

Among other things they are now building at their works a new boiler for the old steamer *Wilson G. Hunt*. She is now being overhauled and put in thorough order, and will be sent up the coast. The new boiler is 8½ feet in diameter, and 22 feet long, containing two furnaces 45 inches wide, and 8 feet 6 inches long, having direct flues and return tubes. The steam chimney is 5½ feet in diameter, and 12 feet high. The boiler is built out of Tennessee iron of an inch thick, and 55,000 tensile strain.

They have just put three new boilers into the steamer *Princess*, which is to be used as a sort of floating elevator. She is to be fitted with machinery for elevating grain in sacks from barges into a vessel, and handling sacks of grain. A boiler 42x26 is also being built for Vance's sawmill, at Eureka, to replace one which burst. Also a boiler 50x16, and coils for a cannery, to be built on this bay. Two large upright hoisting boilers are under construction, and a lot of fish tanks for the Columbia river. Since the new firm commenced business, in October, 39 boilers have been made at their works.

A five-stamp mill is being built for a quicksilver mine at Santa Barbara, a five-stamp mill for the Extra mining company, Shasta county, and an engine and boiler and cast-iron columns for the South Park malt house. Considerable jobbing work is also being done. They are also making some of the work for the running gear of the dummies to be used on the California street railroad.

Our Visit to the Redding Ranch.

We made a brief allusion, last week, to a trip to the Redding ranch, in Shasta county, with the promise of more full mention this week. The time chosen for the trip was probably the most unfavorable one which could have been selected for many years past. We reached there just as railroad communication with the ranch had been cut off by the washing away of the railroad bridge at Cottonwood creek, which empties into the Sacramento just below. By a temporary portage across the creek, and a hand-car upon the other side, we reached Cottonwood station, from whence we were taken in a carriage by Mr. Edward Frisbie, the present proprietor of the ranch, as far as the town of Anderson—a railroad station which has been laid out upon the ranch, and which is rapidly growing up into a point of considerable importance.

The next day after our arrival, the severe storm of Sunday, February 27th set in, by which the Sacramento river and Cottonwood creek were both so swollen that all transit across either was suspended, and no railroad trains could pass northward beyond Red Bluffs. Of course many of the roads about the ranch were nearly impassable, while many of the large sloughs and creeks were quite so. But notwithstanding these difficulties, Mr. Frisbie drove up to the hotel at Anderson bright and early on Monday morning, with a team mud and water proof, and invited us to take

A Look Over the Ranch.

Notwithstanding the disagreeable character of the day and of the roads, we promptly accepted the offer. During the ride we passed over quite an extensive stretch of fine bottom land to the east and south of Anderson, after leaving which we rode along the table or bench lands and parallel to it, and thus continued northwardly until we reached Clear creek, the waters of which were anything but clear. Much of the bottom land was in wheat, which was looking well, but the larger portion was still covered with oaks and scattering undergrowth, and had probably never been put to any other use than pasture. Clear creek, or rather the deep slough running parallel to it, was so swollen by the late rains that we found it impossible to reach the toll bridge; so leaving our carriage, we crossed over on the railroad bridge near by, and made a call upon Mr. J. J. Bell, who keeps the toll bridge at this point, and who owns what has for many years been known as

Bell's Ranch.

We were received with much cordiality by Mr. Bell, who kindly invited us to spend the night and next day with him. Having decided to accept his kindly invitation, we bade good day to Mr. Frisbie, who promised to call for us the next afternoon. Mr. Bell is well-known to all teamsters and travelers who, in ante-railroad days, were accustomed to pass by this route to Oregon and to the "Redding mines," which are located on and near this ranch. He arrived here in May, 1851, purchased 1,300 acres of land of Mr. Redding, settled down to ranching, built a bridge to accommodate the travel in winter, and a large hotel for the convenience of travelers. He is chiefly engaged in stock-raising, and just at this time is paying considerable attention to the breeding of the Angora from the common California goat. He has now two herds, one consisting of 270 and another of about 730.

After discussing a good dinner, Mr. Bell took us over a portion of his ranch, and gave us a little insight into a somewhat extensive mining enterprise which he has in view upon this ranch, and which we shall allude to more fully when we come to speak of the mining interests of this locality. The next morning, Tuesday the 29th ultimo, the rain still continued, but our host brought out a covered buggy, with which the distance to the town of Reading, about eight miles, was soon measured.

The Town of Reading

Is well and pleasantly situated near the west bank of the Sacramento, where that king river of California leaps out of the Sierra Nevada range, and passes along the first bottom land to the plains of the great valley below. The California and Oregon R.R., the great northern railway of the State, passing on its way to the big north State, makes Reading its present terminus.

Here passengers and goods for the large mining and agricultural districts of northern California and southern Oregon diverge from railway transportation. Considering the general routes of travel, it is centrally located in the county, and may some day be fully entitled to the county seat.

The R. R. Co. have a large depot, with commodious side-tracks. There are several well kept hotels, one near the depot being quite large. The town has a good business appearance, with large and well-stocked stores. Mr. Frank, publisher of the *Reading Independent*, prints a good local paper, on bright type, in an entirely new and well adapted building. It is actually the cleanest printing office in America. (Mrs. Frank is a practical printer, which explains this strange feature in a printing office.) Judge Bush, a leading citizen, showed us the town "in brief," stating some forcible arguments in favor of its future rapid growth.

The Return.

Prompt to his word, Mr. Frisbie met us in the afternoon and took us on our return as far as Anderson, where we spent the night, and the next morning, after an early breakfast, our kind friend once more appeared with his carriage and conveyed us to Cottonwood creek, where we found the railroad bridge still unrepaired, and no trains in prospect for some days to come; and as no teams could cross or ford the creek, our only alternative was to cross in a small boat, which had been hastily constructed, and launched while we were there. We were assured that by following along the track for some nine miles, to the "Summit," we should probably find a locomotive and tender upon which we could get a passage the balance of the way to Red Bluffs. So starting out, some

obstructed by the locomotive with which we had failed to connect. Our regret at missing the locomotive was now turned to gladness, from the fact both it and its tender had fallen through a bridge some 20 feet high, the supports of which had been washed away during the day. With considerable efforts, and by the aid of a lantern we were enabled to cross the chasm upon broken timbers, when we once more took up our "tramp" along the road two miles further to the Bluffs, where we arrived weary and hungry, just in time to escape a furious rain storm which set in about 9 o'clock, and continued through the night. We took the next regular train at 4 o'clock A. M., and in due time arrived in San Francisco, fully satisfied with a little rough experience of railroad traveling in a California wet winter.

No one who has not been an eye-witness can form any idea of the labor and expense which has been involved during the past few weeks in the efforts of the railroad company to keep communication open between Red Bluffs and Reading. Everything that human appliances could do has been brought into requisition for this purpose, and we learn by letters received at this office that the first regular train since the break passed up from Red Bluffs on the 7th instant. The experience of this season—the first severe one since the road was built—has shown just what is needed, and the company will, no doubt, so construct their road and bridges that there will be no such interruptions of travel there in future as we have here chronicled. Mainly the road appears well constructed, and the track thoroughly ballasted with good gravel.

Of the fine land we viewed we shall report hereafter.

Legislative Topics.

Among the important topics presented to the Legislature during the week have been proposals from two respected citizens of the State, to give of their wealth to widen the scope of the State University and increase its facilities for imparting instruction. One is the proposal of H. D. Bacon, to give \$25,000 in cash and a library and art collection valued at \$75,000, toward the construction and equipment of a library and art gallery building, providing the State will give \$25,000 to complete the needed fund. A bill has already been introduced making the requisite appropriation of \$25,000 on the part of the State, and it is believed that the bill will prevail. It is certainly a very favorable opportunity for the State to secure these valuable adjuncts to its educational equipment at Berkeley, and the liberality of a citizen should not fail of State recognition. Another proposal of similar nature is that of Hon. S. C. Hastings, of this city, to give \$100,000 as a fund, the interest of which is to be expended in maintaining a law school or college of law as one of the branches of the University. This will place the acquisition of a legal education within easy reach of the young men of the State, and will do away with the need of the expensive undertaking of attending the Eastern law schools. All that Mr. Hastings asks is that the State act as trustee of the fund and see that the interest is rightly applied to the desired end. We are glad to see these evidences of interest and liberal donation to the work of the University by rich and public spirited citizens. If such can be assured that the University will be held to its true onward

course by the State and not be allowed to be tossed hither and thither upon the waves of politics and restless theory, there will cluster about it a wealth of endowments which will advance all departments of its work with but little draft upon the public treasury.

Assemblyman Waters, of San Bernardino, has introduced a bill amending the Penal Code by adding a new section concerning the sale of artificial or spurious honey. Every person who either sells, or exposes or offers for sale, any artificial or spurious honey, as, and for genuine or pure honey, is guilty of a misdemeanor.

Senator Smith, of Los Angeles, has introduced a concurrent resolution protesting against the substitution by Congress of an *ad valorem* duty on imported wines, in place of the *specific* duty of 40 cents a gallon which now exists. Senator Smith rightly reasons that the substitute of a duty according to the value, will flood our country with low-priced and notoriously adulterated foreign wines, and ruin the manufacture of wine from pure juice which is now becoming a great industry in our State and of the country in general. We trust our legislature will give its voice against the removal of the present tariff.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's office at San Francisco:

ARIZONA MINERAL AND LAND Co.—Feb. 9th. Location, Pacific States and Territories. Capital stock, \$100,000. Directors—Wm. T. Alwood, C. M. Seeley, Benjamin Lake, Walter Townsend and T. L. Bibbins.

TOLETO M. Co.—Feb. 9th. Location, Toletogulch, Mariposa Co. Capital stock, \$1,000,000. Directors—Bernard Lande, Edward Meyers, H. H. McClellan, H. H. Hobbs and Grove Adams.

ELLEN GOWAN M. Co.—Feb. 11th. Capital stock, \$10,000,000. Directors—John M. Miner, E. S. Denison, Wm. P. Miller, C. W. Crocker and H. H. Pearson.

EL DORADO S. M. Co.—Feb. 11th. Capital stock, \$1,000,000. Directors—E. F. Eagar, S. C. Nausen, S. B. Bigelow and W. H. Chickering.

THE WHITE FURNACE.—In our advertising columns will be found a card of the Pacific Iron Works, of this city, in relation to the so-called "White patent inclined cylinder roasting and chloridizing furnace," which is now rapidly growing in popular favor, and is fast superseding others. The information given in the card referred to will be of interest and value to our mining friends.

THE DEFIANCE MILL OF SIERRA FLUME AND LUMBER COMPANY.

four miles brought us a point where the road bed and track had been completely washed away for several hundred feet, and a repair train partially wrecked. Picking our way around the wreck, we arrived at the "Summit" only to find that the locomotive and tender, which had come up to that point, had returned, and there was nothing left for us but to continue our weary "tramp" nine miles further.

Curious Railroad Obstruction.

We have frequently read of railroads being washed away, and sinking out of sight in water or mud, but here we saw the mud actually rising up from below, pushing the track up until by its tension it could rise no further, when the mud commenced to overflow, and finally covered the rails and ties completely out of sight. There is here a deep cut through a gravelly hill, the earth of which is of such a yielding nature, that when so completely saturated as it has become by the late rains, the weight of the earth on either side of the cut is sufficient to press the loose material of which the hill is composed upwards along the cut. The rails and road bed had been raised several feet in the center of the cut, while the soft mud was so forced up by the sides of the road as to run over and completely cover the track to a depth of several inches. Large quantities of this mud had been taken out of the cut and dumped off the embankment beyond; but as it still continued to rise, work has been suspended until the water shall drain out and the earth once more become solid.

More "Roughing It."

We continued our "tramp" from this point until darkness was beginning to close in without finding even a convenient barn or sheep camp in which to take shelter for the night, and from a threatening rain storm which was evidently about to overtake us, when we were happily overtaken by Mr. T. J. Davis, the head carpenter of the road, on a small flat car by which we were taken a distance of some three miles, where the further progress of the car was

We tender our thanks to the many friends from whom we received kindly attentions during the above trip, and hope at an early day to embrace an opportunity to revisit this interesting portion of the State under more favorable circumstances.

The Sierra Flume and Lumber Company.

In previous numbers we have given certain details concerning the extensive business of the Sierra Flume and Lumber Company, and also engravings of some of their mills. The company own property worth nearly \$2,000,000, including ten saw mills, three planing mills, and one sash and door factory. They have upwards of 150 miles of V-flume, 11 miles of tramway for logs, and 157 miles of telegraph lines to the mills and factories. The mills have an annual capacity of 50,000 000 feet of lumber.

The lumber is brought to the various mills from the mountains in V-flumes, these furnishing a more rapid and economical means of transportation than any other. The flumes are constructed at considerable expense and trouble, but answer the purpose most admirably. The water is collected from all available streams and springs and brought by feeders to the main flume. It takes a large amount of water to supply the various flumes belonging to the company, and many serious engineering difficulties have to be overcome in their construction. Some of the mills are run by water, some by steam, and some by both water and steam.

The Defiance mill, an engraving of which is shown on this page, is a mill on the Moscow division. It lies in a valley in the mountains with heavy timber all about it. The mill is run by steam, and the lumber sawed by it is delivered by flume at Red Bluffs.

Mining and Scientific Press.

Established in San Francisco in 1860, is now the Largest, Most Original, Best Illustrated, and Most Ably and Carefully Edited Practical Mining Journal on the Western Continent. Its contents are made up of fresh intelligence in a condensed and interesting style, easily appropriated by the reader, who finds its columns replete with new facts and ideas not obtainable in the books of the past, nor in any other of the journals of the day.

Varied in its carefully compiled and conveniently arranged departments, representing the special and leading industries of the Pacific States—Mining, Mechanism, Manufacturing, Building, Improvements and Inventions—it becomes a weekly informant to all Scientific, Mechanical, Manufacturing and Industrial Progressionists on the coast, an immense list of whom testify to its pleasant, profitable and elevating influence.

Let every friend of Science and Industry on this side of the continent take pride in sustaining and advancing a faithful representative of their special interests by subscribing for the PRESS, and urging its patronage by others—without delay.

Subscription, \$4 per annum, in advance.

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their respective Metals without Quick Silver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore. It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, \$2.50 each, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery etc., which alone are of the greatest value. PRICE, \$7.50.

Canadian Patents for U. S. Inventors and Patentees.

One Patent now Embraces all the English Provinces in North America, including the Canadas and British Columbia.

It is only recently that the Canadian Government has granted patents to United States citizens. In consequence hereof the many immensely valuable inventions patented in this country are now patented in Canada. Patents are much sought for and are readily disposed of at fair cash prices. In our country about three-fourths of all manufacturing is based upon patents, especially in the New England States no manufacturing business of any consequence is started without being protected by such. Our neighbors across the border have not been slow in observing and learning that inventions and patents are the foundation of all prosperity in manufacturing purposes. Hence all our patents for labor saving and agricultural machinery and innumerable improvements in home comforts meet a ready market in Canada. Inventors and Patentees should therefore not delay to secure their patents in Canada; many good inventions are already pilviced by Canadians, who, against law and right, appropriate United States inventions and have them patented in their own name. After a patent is granted it is extremely difficult to prove who is the first and original inventor. Therefore, inventors and patentees to be safe, you will have to secure your patents in Canada without delay. We have facilities for securing Canadian patents second to none. Our charges for securing Canadian patents are about \$65. A model is required.

Inventors and patentees! do not delay and lose your opportunity. Things may change. With model and description of your invention remit \$25, and we will prepare all drawings and documents and forward them to you for signature. In about 30 to 50 days we can return your Canadian patent.

DEWEY & CO.,

Patent Solicitors, S. F.

A \$1.00 Book for Every Reader.

THE ILLUSTRATED National Pronouncing Dictionary

—OF THE—

ENGLISH LANGUAGE.

Orthography, and Pronunciation according to the best English authorities, with an appendix containing abbreviations, foreign words, phrases, and forms of address. TWO HUNDRED AND FIFTY ENGRAVINGS.

The design of an English Pronouncing Dictionary is to exhibit the pronunciation of the language as it is current in educated society. It must be admitted that of all the expedients which have been devised to serve this important end, the phonetic is by far the simplest and most effective. The orthoepical department of this dictionary is, therefore, phonetical. The usual orthography of every word is resorted to in such a way as to show at once how it ought to be pronounced. By means of this mode of spelling, combined with proper accentuation and syllabification, a correct pronunciation is exhibited without confusing the eye or perplexing the memory, with a long array of orthoepical notation—an advantage of the utmost importance in any dictionary.

The generally accepted orthography of the language is maintained throughout the work, and the definitions are sufficiently numerous for all ordinary requirements. The illustrative engraving—an entirely new feature in a school dictionary—will greatly aid the pupil in understanding the given definitions.

On the whole, it is not too much to say, that this dictionary meets a great requirement of the age. By reason of the completeness of its component parts, the compactness of its form, and the lowliness of its price, it is sure to command a very extensive circulation wherever the English language is spoken.

Hand-Book of Arizona Territory,

by RICHARD J. HINTON,

(Of the San Francisco Evening Post.)

This volume is now ready. It is a large 12mo. of 530 pages, accompanied by a

NEW MAP OF THE TERRITORY,

Compiled expressly for this work. This is the best map of Arizona yet published, and gives the latest mining districts. The volume will be profusely illustrated, containing full page lithograph views of the Loop, at Tehachape Pass, on the S. P. R. R.; Yuma, Prescott, Phoenix, Florence, Tucson and Tubae; the ancient church of San Xavier del Bac, ruins of the Tumacacori Mission and of Mount Wrightson, and other views of the Santa Rita Mountains. Calabazas, in the valley of Santa Cruz; Coronacion Peak, the Arive Valley and the ruins of Casa Grande.

Also, numerous other engravings of mines and scenes, comprising Mineral Park, Fort Whipple, Castle Dome, Oatman Flat, the Rio Verde Valley, Montezuma's Well, the Salt River Ruins, Indians, Public Buildings, Ancient Ruins and Kennels, etc. In addition to these illustrations, the Hand-Book will contain

An Old Spanish Map of Arizona

And contiguous Territory, never before published; a copy of the famous Father King Map, and profile maps of the Mining District of Mohave County, in which the McCrackin mine is located; of Castle Dome District, Yuma County; of the Bradshaw District, near Prescott, where the Peek mine is worked; of the Pioneer, in which the famous Silver King is located; the Globe, where the Wheatfield, Stonewall Jackson and Miami mines are found; and of the extraordinary rich Santa Rita Districts, the Aztec and Tyndall.

The letter press will be crammed with valuable information, interesting description and accurate data as to the resources of Arizona—its geology, mineralogy, mines, mining, agriculture, etc.; also, of its roads, routes, fares, etc. Its historical chapter will be invaluable; and those on the Ancient People and Ruins of Arizona, as well as on the Desert Missions, Indians, etc., will prove of absorbing interest.

This is the most complete work on a new Territory or mining region ever issued. It is the result of conscientious observation and study, the author having made extended tours through the Territory, and being also in possession of the note-books of mining engineers and explorers, who spent years in examining this marvelous country, which is soon destined to be recognized as the Richest Silver Bearing region on this Continent.

The Hand-Book of Arizona

Will be handsomely printed, profusely illustrated, bound in flexible covers, and sold at retail for \$2 each.

HINTON'S NEW MAP OF ARIZONA. Handsomely colored and mounted, now ready for delivery. Retail, on rollers, for the wall, \$2.50 each; in covers, \$1.50 each.

Liberal deductions made for the trade. Address

Testing and Working Silver Ores.

The above is the title of an illustrated work of 114 pages, for miners and prospectors, by Chas. H. Aaron, which has just been issued by Dewey & Co. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope:

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working same, appliances for testing, roasting, etc. Under the head of "Working Ores" the author describes Aaron's process, has something to say of superheated steam, preparation of dichloride of copper and protochloride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amalgam, Patehen's process, etc. He also describes the methods of working roasted ores, treatment of base metals, stirring, heat of furnace, want of sulphur, etc. Under the head of "Leaching Processes" are the titles, Smelting, Mexican process, Chilean process, Kroschke's process, etc. Under "Pulverizing Machines" are described the acasta and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Noice's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, grinding the ore, directions for making a barrel, preventing mechanical wear, use of quicksilver, copper in bars, Freiberg barrel, cheap barrel trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improvised retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous mention may be found Aaron's leaching apparatus, with two or three different arrangements, a small mill, sampling tailings and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

The book is a serviceable one for miners' and prospectors' use. Price, post free, \$2.00. Address Dewey & Co., MINING AND SCIENTIFIC PRESS, 202 Sansome Street, San Francisco.

UNITED STATES

Mineral Land Laws, Revised Statutes,

AND INSTRUCTIONS AND FORMS

UNDER THE SAME.

We have just issued a pamphlet containing the General Mineral Land Laws of the United States, with instructions of the Commissioner of the Land Office. The contents of this pamphlet comprise all of the Government laws with relation to mineral lands of interest to the mining community, as follows: Mining Statute of May 10th, 1872, with instructions by the Commissioner of the Land Office; Mining Statute of July 26th, 1866; Mining Statute of July 19th, 1870. Forms required under Mining Act of May 10th, 1872, as follows: Notice of Location; Request for Surveys; Application for Patent; Proof of Posting Notice and Diagram of the Claim; Proof that Plat and Notice remained Posted on Claim during Time of Publication; Registers' Certificate of Posting Notice for Sixty Days; Agreement of Publisher; Proof of Publication; Affidavit of \$500 Improvements; Statement and Charge of Fee; Proof of Ownership and Possession in Case of Loss or absence of Mining Records; Affidavit of Citizenship; Certificate that no Suit is Pending; Power of Attorney; Protest and Adverse Claim; Non-Mineral Affidavit; Proof that no Known Veins Exist in a Placer Claim, etc. There is also given the U. S. Coal Land Law and Regulations thereunder. The work comprises thirty pages, and will be sold, post-free, for 50 cents. It should be in the hands of every one having any mining interests. GUN, ROD, AND SADDLE. Nearly Fifty practical articles on subjects connected with Fishing, Shooting, Racing, Trotting, etc. Price, \$1.

FRANK FORESTER'S FIELD SPORTS. Embracing the Game of North America, Upland Shooting, Bay Shooting, Wild Sporting of the Wilderness, Forest, Prairie, and Mountain Sports, Bear Hunting, Turkey Shooting, etc. Illustrated. 2 Vols. Price, \$1.

Any of the above books will be sold on the Pacific Coast, by Dewey & Co., and mailed for the price named. [In some instances there may be a delay (not over twenty days) from receipt of orders with the cash.]

Other agriculture books furnished at the publishers prices.

DEWEY & CO., Publishers,

202 Sansome Street, San Francisco.

Questions of the Times.

Which are the most reliable watches?

American watches, they are driving those of foreign make out of the market.

Which is the best American watch?

The Hampden watch, made at Springfield, Mass.

Why is it the best watch?

Because it is substantial in all its parts, constructed on the best principles and embodies those improvements which experience has shown to be most desirable.

Why is the Hampden watch so popular?

Because in buying one you are sure of getting a good time-keeper. While purchasing a watch of most other makes is like investing in a lottery—a great many blanks to one prize.

Which is the cheapest watch?

The most economical is the Hampden watch. For you can get one of these excellent time-keepers for less than it costs in a short time to patch up a poor watch, which benefits no one but the repairer.

Where can I get a Hampden watch?

By addressing the long established, practical watch-makers and jewelers, DEWEY & JORDAN, 433 Montgomery St., San Francisco, who will send you a descriptive price list, including the following styles of movements: "Hampden," "Geo. San. Rice," "Chas. E. Hayward," "Aaron Bagg," "The E. Studley," "Chester Wolworth," "Frederick Billings," "Railway," "John L. King," "E. W. Bond."

HENRY C. EGERTON,

Mill and Mine Supply Buyer,

And Receiver of Ores, Bullion and Gold Dust,

Dewey & Co. { 202 } Patent Ag'ts. { Sansome St }

DEWEY & CO.**American & Foreign Patent Agents**

OFFICE, 202 SANSONE ST., N. E. COR. PINE, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free

Home Counsel.

Our long experience in obtaining patents for inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

SAN FRANCISCO.

WM. BARTLING.

HENRY KIMBALL

BARTLING & KIMBALL,
BOOKBINDERS,
Paper Rulers & Blank Book Manufacturers.
505 Clay Street, (southwest corner Sansone),
SAN FRANCISCO.

Among the advantages gained by this holder are the following:
It can be opened and closed quickly.

The points are less obstructed while the articles to be filed are being placed.

The papers (wholly or partly folded) can be either "straddled" over the lower bar, or filed in regular book order.

The elastic hinge and band accommodate and hold firm either a large or small number of papers.

With less material, it is lighter and less cumbersome than other holders, and approaches nearer to bookbinding. It has no rigid hooks, hinges or loose parts to break or get lost.

It has proved durable in practice. The file is adjusted but 52 times a year for a weekly paper, and a sample holder can be opened and closed 1,000 times without showing wear.

Five sizes are made to suit the dimensions of different papers, viz.: 18, 22, 26, 30 and 34 inches, inside measure. Single samples will be mailed from office for 50 cents, (and upward, according to size), postpaid. Wholesale and retail agents wanted.

ARITHMETIC MADE EASY BY ROPPS EASY CALCULATOR.

This valuable work is used by thousands of farmers, mechanics and business men, and is highly recommended for its practical utility and convenience.

It embodies an entirely new system of calculation, by which a vast amount of figures and mental labor—required by the ordinary methods—and fractions with their complexities, are absolutely avoided.

It is so simple and easily comprehended that even the most illiterate is enabled, in a few minutes, to reckon with absolute accuracy and speed; while its original and rapid methods, benefit and delight the most scholarly.

It shows at a glance the accurate value of wheat, corn, rye, oats, barley, cattle, hogs, hay, coal, lumber and merchandise, from one pound to a car load, and for any price the market is likely to reach.

It gives the interest, simple and compound, on any sum, for any time, at six, seven, eight, and ten per cent.; the exact measurement of boards, scantlings, timbers, saw logs, cisterns, tanks, wells, granaries, bins, wagon beds, corn cribs, etc., the wages at various rates, for hours, days, weeks and months; besides numerous other important methods, rules and tables.

It is printed on fine tinted paper, is well and elegantly bound in pocket-book shape, and accompanied by a slate, pocket for papers, and memorandum, which can be replenished in the two latter styles.

It answers the purpose of a pocket book and diary, and costs no more, although it was gotten up at great expense and labor, and is unquestionably one of the most useful publications ever issued from the press.

Price, bound in Fine English Cloth, \$1.00.

The Latest and Most Complete Manual.

THIRD EDITION OF

Skidmore's Mining Statutes,

WITH INSTRUCTIONS, DIGEST OF JUDICIAL AND
DEPARTMENTAL DECISIONS, RULES OF PRACTICE,
FORMS FOR SECURING AND CONVEYING TITLE, SPECIAL STATUTES,

AND INDEX.

We have no hesitation in announcing Mr. Skidmore's popular work, as revised and enlarged, the most complete, reliable, and useful Manual of Mineral Law extant. It contains many features not found in other works, such as the Rules of Practice established by the Department of the Interior, the Coal and Saline Acts, the Timber Regulations, and Digest of the most recent and important Judicial Decisions. The ordinary Forms of Incorporation and Conveyancing of Mining Claims in use in California have been added, and a full index renders the various matters easy of reference.

The Digest gives the dates of the decisions and reference to the periodicals and works in which they may be found, and the introduction of index words and phrases in capitals and bold-faced letters renders it easy to find at once the particular information needed.

Mr. Skidmore's Commentary is a more elaborate work, a treatise for the lawyer, but even to those of the legal profession who have that work, this will be a convenient and valuable hand-book.

Mr. Skidmore seems determined to retain the enviable reputation established for his work as the most complete and reliable

Manual of Mining Law.

It is beautifully printed upon the best paper; contains 140 clearly and closely printed octavo pages, and is published at the low prices of \$1 in pamphlet and \$1.50 in law sheep binding.

Mailed, post-paid on receipt of price.

No. 218 Sansone Street.

It is not surpassed by any dining house in the city. The saloon is new, commodious, elegant and comfortable, and all visitors to San Francisco, who wish good food well prepared and properly presented, at reasonable prices, should try the "Palace." Being new, it is fitted up with the latest and best approved cooking apparatus and other conveniences for patrons.

Tip-top Dinners, 50 Cents.

Are given from 5 to 8 o'clock p. m. It will pay yourself (and friends, too,) to go considerably out of your way to visit and patronize this first-class restaurant.

ERNEST SCHNUTENHAUS,
J. M. WEBSTER,
Proprietors.

To Ship and Engine Builders, Steamship Companies, Etc.

A Mechanical Engineer, having an extensive experience in Marine Engineering (especially compound) and Iron Ship Building, also in Steam Engines and Machinery in general, is open for engagement. First-class references. Address and references can be obtained at office of Scientific Press.

50 BEST Mixed Cards, with name, in case, 13c., or 25 no two alike, 10c. Outfit 10c. Dowd & Co., Bristol, Ct.

Metallurgy and Ores.**E. K. STEVENOT & CO.'S**

BORAX AND METALLURGICAL REFINERY.

Assay Office and Chemical Laboratory,

Cheetnut St., bet. Powell and Mason,

(NORTH BEACH.)

SAN FRANCISCO

Refiners of Borax, Alum, Nitrate of Soda, Saltpeter, Potash, Etc.
Sampling, Assaying or Analyzing of Minerals, small lots of ores bought or worked by any process.
Old Copper Plates bought or worked up. Deposits of Bullion run into bars.

PATENTS AND INVENTIONS.

List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch from Washington, D. C.

WEEK ENDING JANUARY 29TH.

CARPET SWEEPERS.—B. Figer, S. F. **UMBRELLA RUNNERS.**—A. Good, S. F. **WELL-BORING MACHINES.**—J. Haas and J. Manning, Stockton, Cal. **DEVICES FOR OPERATING WINDOWS AND FRAMES.**—J. Kelly, S. F. **COMPOUNDS FOR PRODUCING ILLUMINATING GAS.**—L. Marks, S. F. **DERRICKS.**—T. Powell, Stockton, Cal. **NETTING FOR UNLOADING WAGONS.**—T. Powell, Stockton, Cal. **CHECK VALVES FOR BID COCKS AND FAUCETS.**—O. Chiller, Sacramento, Cal. **OSCILLATING PUMPS.**—P. A. Clark, Anaheim, Cal. **NUT LOCKS.**—L. Landeker and H. S. Laird, San Luis Obispo, Cal. **SPRING BED AND FIRE-ESCAPES.**—J. G. Rahner, Portland, Oregon. **THE MANUFACTURE OF DOORS, ETC.**—J. Springer, S. F. **SCRUBBING MACHINES.**—A. F. Stockley, Bishop Creek, Cal. **HAY CUTTERS.**—J. Weichart, S. F.

—The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of mention:

NETTING FOR UNLOADING WAGONS.—Thomas Powell, Stockton. This device is an improved arrangement for connecting and disconnecting the two halves of the false bottom or netting which is placed in the bottom of a header wagon before it is loaded, so that the load can be belted holly and dumped at one operation. Each half of the net is triangular in form, so when connected the false bottom is diamond-shaped. Two corners only have then to be gathered together above the load. The frame is composed of hinged bars which can be closed together, so as to retain the load, but which will open out when the latch is detached, so as to form an opening through which the load can pass. When the frame is opened, the load drops readily through the opening, without the entire separation of the parts of the netting, so that the parts can be easily connected after the load has been dropped. This arrangement prevents the possibility of injury to bystanders, as often happens with the ordinary net, when the lower ends of the parts fly outward by the dropping of the load.

NUT LOCK.—Lazare Landeker, Laird Landeker and Hilamon Spencer, San Luis Obispo. The object of the invention is to provide a cheap, simple and effective device for securing nuts to bolts, which are liable to become loose by constant jarring or other causes. It consists of a metallic washer, having projecting flanges on its upper side, which prevent the nut from turning on the washer, and having one or more pawls, or catches, which engage with radial slots or grooves in a second washer, placed below the first, or in the surface, which the first or upper washer is in contact with, so that, as the nut is turned on the bolt, the first washer turns with it and engages with the slots or grooves, so as to prevent the bolt from turning back, but permitting it to be turned forward or tightened whenever it becomes loose. In case a second washer is used, it is provided with flanges, which enter the hole and thus prevent it from turning on the bolt.

SCRUBBING AND MOPPING MACHINE.—F. Stockley, Bishop Creek, Inyo county. The machine for scrubbing and mopping floors consists of a tank mounted upon a wheel at one end and a scrubbing brush at the other end. The tank serves for containing and heating the water to be used in cleaning the floor. The inventor also provides a lamp-chamber below the tank, in which a lamp is carried for heating the water, a sprinkler for spraying the water upon the floor and brush and mop for drying the floor after the brush has passed over it. The whole is combined in one machine and operated automatically from the hearing-wheel, which supports the tank.

PUMP.—P. A. Clark, Anaheim, Los Angeles county. The inventor calls this an improved quadruple suction and force pump. The invention consists of a rocking or oscillating piston, moving upon a longitudinal axis in a cylinder which has a diaphragm longitudinally through its center. This diaphragm is so made as to re-

ceive two sets of suction valves and two sets of discharge valves, which are respectively connected by proper passages with the inlet and outlet pipes. The operation of each valve is to close first the lower and then the upper part, so that there are four openings for ingress and four for the discharge of water at each complete or double movement of the piston, each valve doing double duty. As the piston and the diaphragm form four distinct chambers of the cylinder, it will be seen that the two diagonally opposite will be taking in water while the other two are discharging it.

CARPET SWEEPER.—B. Figer, S. F. This patent covers certain improvements in that class of carpet sweepers in which a revolving brush is mounted inside of a case so as to sweep the floor when the case is moved over it. The improvement consists of a novel device for securing the brush in the box or case by which it can be readily detached, so as to be taken out for the purpose of cleaning the brush or sweeper. The device for securing the brush in the case is so arranged that the brush can also be adjusted to or from the floor, so that as the bristles of the brush wear away, the brush can be adjusted so as to preserve the same relative position with reference to the floor. The invention further consists of a novel application of the India rubber band which is used for protecting the furniture from being marred when sweeping, and in a lid for opening and removing the dust in the box without removing the brush.

DERRICK.—Thomas Powell, Stockton. The invention relates more particularly to such derricks as are used for lifting loads of grain from header wagons and for other hoisting purposes. The improvement consists in so applying the ropes which sustain the boom and hoists the load, that they will form a truss to stiffen and strengthen the mast, so that the heavier the load the more perfectly will the truss brace the mast, thus admitting the use of a light mast. It also relates to a novel arrangement for supporting and steadying the mast. The inventor claims that a derrick constructed in this way will lift a load that an untrussed derrick of this size and character would not sustain, and as lightness is an important element where a derrick requires to be frequently moved, this one will be especially convenient and useful.

UMBRELLA RUNNER.—A. Good, S. F. This is an arrangement for securing the braces of an umbrella in the runner which moves on the handle so they can be readily detached therefrom and replaced when necessary. The runner can be cheaply manufactured and is extremely convenient because any person can secure the frames from the runner with very little trouble when the umbrella or braces are to be reframed, and replace them when desired.

HAY CUTTER.—John Weichart, S. F. This covers an automatic arrangement for feeding straw to the knives of a feed cutting box. The device is so arranged that it gives the straw a forward thrust after each knife passes the end of the box, thus projecting a sufficient length of straw for the succeeding knife to cut and leaving it stationary while the knife is in the act of cutting. By the means adopted the straw is fed regularly at the proper instant and is not forced against the knives.

OPERATING WINDOW SASHES.—James Kelly, S. F. This invention relates to certain improvements in operating window sashes, transoms and other doors or devices which are suspended so as to turn about an axis, and which may be situated out of convenient reach. It consists in a combination of a rotating axis with certain levers which communicate with a set-screw or knob, so that by a slight movement of the knob the window may be opened or closed, and may be secured at any point by a turn of the knob.

KOHLER & CHASE'S NEW BUILDING.—A handsome building for Kohler & Chase, the enterprising music dealers of this city, whose names are familiar to our readers, has just been completed on the corner of Ninth and Washington streets, Oakland. It is the most conspicuous building and the only full four-story structure yet completed in that city. The building is constructed of brick, iron, stone and wood, and is as far as possible earthquake proof, and has been put up in good as well as substantial style. Newsom Bros., the architects, have succeeded admirably in planning the building for its special requirements. The cellar runs out to the edge of the sidewalk, and affords an excellent place for storage. The store on the corner is used by Kohler & Chase as a music store, and is very handsomely fitted up. The upper floors are used as a lodging house, the rooms being arranged in suites. The arrangement of the rooms is such that each suite is independent of the others, so that the occupants have more seclusion than is common in such cases. All these rooms are handsomely furnished, and are now occupied. A feature of the building is the great number of large, bow windows, making it essentially Californian in appearance, and very light and warm. The edifice is surmounted by an ornamental tower, which affords opportunity for an excellent view of the surrounding country. The entire structure, externally and internally, is an ornament to the city and a credit to the owners and architects. It cost about \$75,000.

PHOTOGRAPHIC MATERIALS.—E. & H. T. Anthony & Co., of 591 Broadway, New York, are among the largest manufacturers of photographic materials in the United States. Their goods are furnished to local dealers everywhere, and their names are familiar to all photographers. The illustrated catalogue of this firm, which will be sent on application, gives a list of articles manufactured by them, which would astonish one not knowing how many accessories are needed in a first-class photographic gallery. It includes camera boxes, lenses, presses, backgrounds, cottons, collodions, varnishes, head-rests, back supports, chairs, negative boxes, photographic tents, retouching frames and pencils, glass pans and baths, and all the thousand and one things used by photographers. They also manufacture all the chemicals used in the art. The goods are all made of first quality, a fact which has brought the firm's name to the position it occupies.

The attention of our mining readers is called to the card of Mr. Henry Sewell, M. E., in our advertising columns. Mr. Sewell, who is well-known on this coast, makes a specialty of the reduction of native sulphur ores by the Sicilian method, and the smelting of argentiferous copper ores by the method practiced in Chile.

WOODWARD'S GARDENS has the following new attractions: The buffalo chase; large whale skeleton; new museum; improvements in the zoological department, besides the other features which have made it popular.

Information Wanted.—Any information as to the whereabouts of Mr. John Donohue, who left Ireland for Idaho City, in April, 1870, will be thankfully received by a friend that is inquiring for him. Address P. O. Box 2361, San Francisco, Cal.

To Mining Secretaries.

An amendment to Section 336 of the California Code, taking effect July 1st, 1874, provides that in addition to the regular publication, daily or weekly, of the assessment and sale notices as heretofore.

PERSONAL NOTICE

Must be served as provided in the following quotation from the law: "The notice must be personally served upon each stockholder, or in lieu of personal service, must be sent through the mail, addressed to each stockholder at his place of residence, if known, and if not known, at the place where he principal office of the Corporation is situated."

The above refers to the ASSESSMENT NOTICE only. Advertisers in the MINING AND SCIENTIFIC PRESS will be furnished with copies of assessment notices printed on slips suitable for serving personal notice under this law at short notice.

DEWEY & CO., Publishers.

Mining and Other Companies.

South Overman Consolidated Mining Co.—

Location of works, Gold Hill, Nevada.

NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 1), levied on the twenty-sixth day of December, 1877, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Kach, Benoit.....	32	50	\$ 12 50
Kach, Benoit.....	33	50	12 50
Rosenblum, N.....	100	100	25 00
Sullivan, Thomas.....	68	25	6 25
Wilder, David, trustee.....	109	2500	625 00

And in accordance with law, and an order of the Board of Trustees, made on the twenty-sixth day of December, 1877, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, 328 Montgomery St., S. F., on the eighteenth day of February, 1878, at the hour of twelve o'clock a. m., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

DAVID WILDER, Sec'y.
Office, 328 Montgomery Street, Room 21, San Francisco Cal.

Copp's Hand-Book of Mining Laws.

Henry N. Copp's hand-book of mining laws, just issued, contains the United States mining laws and instructions thereunder, a digest of decisions, forms, list of mining patents issued, etc. The digest of decisions alone is a very valuable thing, giving, as it does, in brief form, all the decisions of the Secretary of the Interior and Commissioner of the General Land Office in relation to mining matters. These are all under proper headings for easy reference. Forms are given for notice of location, proof of labor, notice of forfeiture, miners' lien, application for survey, patent, etc., affidavit of improvements, etc. There is also a list of patents issued for mining claims from July 26th, 1866, to August 1st, 1877. The book is of pocket size and very convenient for all who are interested in mines. It will be sent post-paid for \$1, on application to Dewey & Co., 202 Sansome street, San Francisco.

MINING INTEREST FOR SALE.

For a small amount, in several claims on one of the

RICHEST LEDGES IN ARIZONA.

Money needed for development. The ore will pay a band some margin to ship to the city. Apply at this office.

REGISTER YOUR
TRADE
MARKS.

MARKS.

The U. S. Government now offers greater protection than formerly to manufacturers under the law of Trade Marks.
Those who manufacture a superior article, or put up improved packages of merchandise, should protect themselves from imitations by registering their Trade Marks.
We have special facilities for securing full rights by the registration of Trade Marks, and our terms are very reasonable.
Consultations free. Many dealers have missed fortunes from not being fully informed and protecting themselves in their rights.

To Capitalists & Land Owners

EUCALYPTUS GLOBULUS,
OR BLUE GUM TREE.

We are now prepared to fill orders for BLUE GUM TREES, for 1,000 to 50,000, and are selling and taking contracts at Reduced Rates.
We are also prepared to take contracts to plant forests of from 10 to 1,000 Acres in extent, or to subdivide large tracts of land with belts of timber, into 100 acre lots, or any given size required, and furnish and plant the trees, or will plant avenues of trees from one mile to any number required, or will contract to plant trees on any Homestead or new Towns.
We are also prepared to plant forests of Gum Trees on any of the hills in the suburbs of SAN FRANCISCO, from a 50-acre lot to 100 acres, or on any of the Sand Hills, after they have been graded, or if not graded, if fenced, so as to protect the trees from the drifting sands.
We would also call special attention to the fact that land can be fenced in with Blue Gum Trees, and the cost is much less than any other kind of fence, is more durable, furnishes protection to growing crops, and saves expense in firewood, which has been fully demonstrated.
To persons having large or small tracts of land, we shall be pleased to receive appointments, that we may show them the great advantages of forest culture, and can make such liberal propositions as will be greatly to their advantage. Address,

THE CLIMATE OF CALIFORNIA.
A thoroughly studied and ably written treatise on this subject by Hon. B. B. Redding, appears complete in the PACIFIC RURAL PRESS for January 20th, and also the MINING AND SCIENTIFIC PRESS. Based upon facts, figures and careful and extensive observations made in various parts of the State on this important subject, it is a volume of reliable information, interesting to every resident of the State. The information is condensed in a paper read before the California Academy of Sciences, and is published in the Press as read before that Society without any alterations or omissions. Extra copies, post-paid, 10 cents. Address DEWEY & CO., Publishers, 202 Sansome Street, San Francisco.

FINE RANCH FOR SALE.

LOWEST PRICE, \$8,000.

The ranch is situated on the direct stage road between Mendocino City and Cloverdale, in Mendocino County. Forty miles from Cloverdale, 20 miles from Navarro Ridge and one mile from the Christine Postoffice.
It Consists of a Total of 2,000 Acres,
Of which 640 are secured by Government title and the balance by possessory title. It consists of
150 Acres of Rich Bottom Land,
Which is adapted to the raising of Wheat, Barley, Oats, Potatoes, Corn, Vegetables, etc., and will raise as large crops as any land in the county. There is 1,210 acres of Fine Rolling Land which is a No. 1 pasture land, and capable of keeping 1,000 head of Sheep, or 100 Dairy Cows. The whole ranch is well fenced with jacket and post and rail fence, and has eight good buildings on it, consisting of a good substantial and comfortable
Dwelling House of Six Rooms,
Two Barns, one of them 100x40 feet, and the other 40x40 feet, a Granary, Woodshed, Chicken House, and a No. 1 Dairy House, new last year. There is a bounteous and never failing supply of good soft water at both the Dwelling and Dairy Houses.
On the ranch is a large quantity of Redwood timber, suitable for all purposes. There is a
Fine Orchard of Some 300 Trees,
Of the choicest varieties of Peach, Apple, Pear and Plum, as well as a large quantity of Grapevines, Currant and Gooseberry bushes, and other small fruit. There is 100 acres sown to Wheat and Barley, which is now up four or five inches, and promises an abundant harvest in the fall.
The owner has also about 40 head of Cattle, a few Sheep, five horses, 150 head of hogs, 100 Hens, and a large supply of all necessary Farming Utensils, which he will dispose of to the purchaser at very reasonable terms if desired.
The neighborhood is as good as could be desired, only one mile from a store and one-half mile to a good schoolhouse, as well as one-half mile from a church.
The owner's reasons for selling are his wife's health and his dislike of the business. At the price at which it is offered it is the cheapest ranch in Mendocino County, as the crop bids fair to be worth when harvested, \$4,000.
Terms are \$3,000, one-half cash and the balance secured by a mortgage at one per cent. For full information, address
DEWEY & CO., 202 Sansome Street,
SAN FRANCISCO, CAL.

THE JAPANESE PERSIMMON.

THIS EXCELLENT FRUIT
SHOULD BE ON EVERY FARM,
AND IN EVERY GARDEN.

GOOD LAND

— IN A —

FAVORABLE LOCATION,
GUARANTEEING

Sure Crops Every Year.

The Redding Ranch,

In the Upper Sacramento Valley, originally embracing over 26,000 acres of

Choice Grain, Orchard and Pasture Land,

Is now offered for sale at low prices and on favorable terms of payment,

In Sub-Divisions to Suit Purchasers.

The ranch was selected at an early day by Major P. B. Redding, one of the largest pioneer land owners in California. It is situated on the west side of the Sacramento River and extends over 20 miles along its bank.

The average rainfall is about 30 inches per annum, and crops have never been known to fail from drouth.

The climate is generally healthy and comparatively desirable. The near proximity of high mountain peaks give cool nights during the "heated terms" which occur in our California summers.

Figs, Grapes, Peaches, Prunes, Almonds, English Walnuts, Oranges and other temperate and semi-tropical fruits can be raised with success on most of the tract. Also, Vegetables, Corn and all other cereals ordinarily grown in the State.

A considerable amount of the rich bottom land has already been cultivated.

Deep Soil With Lasting Qualities.

The soil throughout the tilled portions of the ranch proves to be of great depth and enduring in its good qualities. It is quite free from foul growths. The virgin soil among the large oak trees on the bottom land is easily broken up and cultivated.

The California and Oregon railroad traverses nearly the entire length of the tract. There are several sections, stations and switches, besides depots at the towns of Anderson and Reading—all of which are located within the limits of the ranch.

For Colonies.

Land suitable for settlers in colonies can be obtained on good terms.

Town Lots

Are offered for sale in Reading, situated on the Sacramento River, at the present terminus of the railroad. It is the converging and distributing point for large, prosperous mining and agricultural districts in Northern California and Southern Oregon. Also, lots in the town of Anderson, situated more centrally on the ranch. Lots in both these towns are offered at a bargain, for the purpose of building up the towns and facilitating settlement of the ranch.

Purchasers are invited to come and see the lands before buying here or elsewhere. Apply on the ranch, to the proprietor,

EDWARD FRISBIE,

Anderson, Shasta Co., Cal.

THE "WHITE" PATENT ROASTING FURNACE.
Caution to the Mining Public!

The undersigned proprietors of the Pacific Iron Works, San Francisco, are the only parties who are authorized to manufacture and sell the so-called White Inclined Cylinder Roasting and Chloridizing Furnace, as erected and so successfully operated at the Jefferson, Comanche, Leopard, Ural, Star, Grand Prize, Navajo, Eagle, Tip Top, Hackberry and Peck Mines of Nevada and Arizona, and in which are embraced the devices and improvements secured by the Patents No. 44,146 and No. 46,287, issued September 6th, 1864, and February 7th, 1865, to Geo. W. White, and the Patent No. 190,217, issued May 1st, 1877, to John Howell.

These furnaces all combine and embrace the improvements and combinations covered by Howell's Patent, and by which it is made practicable to expose ores at first to a moderate heat, and to gradually increase the heat on the same, as they are progressed through the furnace, which system is in accord with the well-known and long established principle and practice of roasting ore. These are the only inclined rotary cylinder furnaces which have been successfully operated—all others not embracing the Howell patent improvements and combinations having in every case proven to be miserable and expensive failures, as can be attested by all who are conversant with the facts.

The undersigned, with Mr. John Howell, are the sole owners of the Howell Patent, and we have perfected arrangements with him, and also with Mr. James M. Thompson, who is owner of an interest in the White Patents (and as such is possessed of as full and perfect rights under the same as the patentee himself) by which we have acquired the exclusive right to manufacture these valuable Furnaces for the Pacific States and Territories, and we hereby CAUTION all persons against purchasing the same from any one but ourselves, or said Howell or Thompson.

We manufacture either form of Furnace, having the full or the partial brick-lined cylinder, as purchasers may prefer, but either form embrace Howell's patented improvements, as well as the original inclined revolving cylinder, covered by the White Patents.

We have also recently greatly improved the furnace in its mechanical construction, of which all will be convinced who may favor us with a call.

PACIFIC IRON WORKS, RANKIN, BRAYTON & CO.,

First and Fremont Streets, between Minna and Howard, San Francisco, Cal.

The "San Francisco Law Journal."

Published weekly, in 8vo size—like the California Reports—contains ALL the decisions of the California Supreme Court, soon as rendered, with syllabus and statements of facts; and also, important decisions of other courts of last resort. Two volumes each year, commencing September first and March first, with full index, so it can be nicely and cheaply bound.

Price, only \$6.50 per year, or \$3.50 for six months, strictly in advance. We print a "Legal Directory" on the Journal cover of lawyers' address cards, kept corrected for the year, for \$3, or six months, \$2 in advance. Journal and card both one year in advance, \$9. Six months, both, \$5. Remit by postal order or registered letter, specifying what date or number to begin. Back numbers furnished. Single numbers 25 cents each. Legal briefs and transcripts our specialty. Address

A New Dredging Pump.

The recent unsuccessful attempts to raise the auriferous deposits which are supposed to exist on the bottoms of those rivers from whose banks the early pioneer was wont to reap a rich harvest, have induced some of our mechanics and inventors to investigate the matter of dredging machines suitable for this purpose, with a view to producing one better adapted for raising the conglomerates of earth, stones and gravel with which such deposits are intermixed. Several improvements on previously existing machines have been suggested and patented, but none of them, so far as we are aware, have met all the requirements of a mining dredge. A machine for this purpose must have capacity, durability, simplicity and no contractions or valves to obstruct the free passage of this water and material through its conduits.

Last summer a company was incorporated in this city under the name and style of the American Dredging and Mining Company, whose object was (among other things) to provide improved machinery for doing this class of dredging. This company has just completed a new machine for raising earthy and gravelly deposits, which is not only a novelty in dredging machines, but is a piece of astonishing mechanical ingenuity, because of its extreme simplicity and its extraordinary capacity and also its perfect adaptability for raising water and gravelly deposits from their subaqueous beds. The company has constructed one of these machines at the corner of Mission and Fremont streets, in this city, and have provided arrangements for exhibiting its wonderful capacity in actual operation. It is described as follows: The lifting power is a vacuum produced by centrifugal action. The centrifugal machine is simply a solid wheel or disk, which is secured horizontally to the lower end of a vertical spindle, and which is provided with radial passages extending from its center to its circumference. These radial passages communicate with a central passage which leads down through a hub-like extension on the underside of the wheel or disk. The disk is mounted in the upper part of a case or chamber, the lower portion of which is shaped like a hopper, while the upper part or cover is an inverted frustum of a cone. The suction pipe, through which the water and earthy material are raised, is stationary and extends down through the case to the bottom of the river, bay or excavation in the usual way, and its upper end terminates close to the end of the hub-like projection of the wheel or disk, so that the hose or passage in the suction pipe is in line with the bore or passage in the hub. As stated above, the end of the projection and the end of the suction pipe come close together, but they do not touch each other. A groove is made in the face of one of these abutting ends surrounding the bore or passage, and this groove is connected by a pipe with a small force pump which forces clear water into the groove at a higher pressure than the pressure in the passage inside the joint or in the chamber outside the joint, thus excluding all mud, sand or gravel from between the moving faces by the superior pressure of the water as it issues from the joint both inward and outward. At the lower part of the hopper-shaped bottom of the chamber, the discharge pipe commences and curves upward outside the chamber, as far as desired, or leads to a distance from the machine where the material is to be deposited. Power having been applied to drive the wheel or disk at a suitable rate of speed, the water is then primed by filling it with water, if the machine is situated or operated above the surface of the water, and the air is allowed to escape simultaneously through an air-pipe provided for the purpose. The speedy revolutions of the disk will then throw the water and material from the radiating passages against the diverging sides of the cover or upper part of the case whence it falls into the hopper-shaped portion and is forced out through the discharge pipe by the accumulating pressure of material in the chamber. If the machine is submerged, no priming is necessary, as it will prime itself.

It will be noticed that the machine has no

valves or contractions to obstruct the free passage through it of the mud, sand, gravel or other substance that enters the nozzle of the suction pipe. The pipe is so adapted as to provide a gradually increasing area towards the point of discharge, so that the material cannot choke or clog in the passages.

This dredge has been examined by a number of mechanical and hydraulic engineers, among them Prof. Davidson, and Col. Mendell, of the U. S. Army, all of whom have pronounced it "the simplest and most effective apparatus for the purpose that they have ever seen."

The machine is the invention of Mr. Eugene Moreau, one of our most ingenious and skillful mechanics. The company has applied through the MINING AND SCIENTIFIC PRESS Patent Agency for letters patent covering the invention in this and foreign countries. For further particulars, address Geo. W. Deitzler, President of the American Dredging and Mining Company, No. 426 Montgomery street, S. F.

Ornamental Aquarium and Bird Cage.

The very pretty combination of bird cage and aquarium, shown in the accompanying engraving.

BIRD CAGE AND AQUARIUM.

ing, is formed by an ingenious application of philosophical principles, on a plan devised and patented by Matthew Palen and Daniel Sexton. The invention consists in constructing an aquarium in such a manner that a portion of the water can be raised into a chamber, which extends above the level of the water in the main tank, so that the fish can pass from the main tank into the elevated chamber and back again. By combining this style of aquarium with a bird cage, a very pretty effect is produced, as the birds appear to be flying about in companionship with the fish, and at first glance it is hard to tell whether the inhabitants of air are in the water or inhabitants of water in the air. The air is exhausted from the top of the receiver and the water flows in and is sustained there by atmospheric pressure. The invention can be applied in this and various other ways, so as to give peculiar and apparently mysterious effects. Those wishing rights to this invention, may procure them reasonably by addressing Matthew Palen & Co., care of Dewey & Co., 202 Sansome street.

OFFICERS of the Postoffice Department estimate that the revenues of the Department are suffering not less than \$250,000 per month by the flood of stamps sold by Postmasters at small country offices at a discount for use in cities and towns.

The Baxter Engine.

We illustrate herewith the Baxter Engine, made by the Celts' Arms Company of Hartford, and of which Thomas J. Fales, 18 Park Place, is agent in New York, and Baker & Hamilton, 13 to 19 Front street, are agents in San Francisco. The engine possesses many peculiarities and can be used for all kinds of machinery requiring a propelling power, and is of the capacity of from two to fifteen horse power. It is made complete with boilers, gauges, and every required attachment necessary to be successfully run. The engine occupies less space and consumes less fuel than ordinary engines. It is interchangeable in every part. This compact form of the Baxter insures strength and durability, and by reason of its light weight it can be transported at a very cheap rate by railway or by any other mode of conveyance. The two horse power occupies only two and a half feet of space, and the ten horse power only four and a half feet. It can be placed on any floor of a building where the work is required to be done, and, when placed in position any intelligent person can run it with complete safety. The cylinder of the Baxter is immersed in steam, therefore there is no liability to condensation, which avoids a great loss of power experienced by engines constructed on different principles. The crown sheet being convex, prevents deposit of sediment or the formation of scales, and as the circulation of the water in the boiler is per-

THE BAXTER ENGINE.

fect all sediment is held in suspension, and by blowing off once a week under pressure, the boiler can be kept perfectly clean. These engines have received awards at many fairs. They are no experiment, having now been long in use in many localities. The engine is built upon and secured to the cylinder, as shown in the engraving, all parts being turned and squared by lathes and planers, consequently all parts will fit properly, be in line, and correctly placed one to the other, so that no one of the parts will be thrown out of adjustment by expansion.

MINERALS FOR PARIS.—Just as the committee having charge of the mineral collections from this coast for exhibition at Paris, gave up all hopes of obtaining funds for the purpose, and signified their intention of abandoning the idea of making the exhibit, Mr. J. W. Mackay, of the "bonanza firm," comes forward in time to save the credit of the State, by generously offering to pay all the expenses of the exhibit. The collection will therefore be completed, and sent on, and the committee urge all those interested in mining matters to send forward specimens, so that they may make a creditable display. It is understood that Mr. H. G. Hawks will take charge of the exhibit at Paris, he having prepared and arranged the specimens here. Mr. Mackay deserves the thanks of the mining community for his generosity in furnishing the funds for carrying out this project.

Quartz Mill Tailings.

A great deal of complaint has been made from time to time on the question of ownership of tailings from quartz mills. It has been the custom to leave the tailings to the mill men, no matter to whom the quartz belonged. In the case of custom mills no other arrangement can be very well made, as it would be impossible to segregate the different lots of tailings. This fact has been taken advantage of, to the detriment of stockholders. People would get in as directors of a mining company, and make a contract for milling the quartz for a year at a mill in which they were interested. The mill would work up to 50% or 60%, and the balance would go into the tailings. As the directors had little pecuniary interest in the mine and a great deal in the mill, this plan of operations would be good for them but had for the owners of stock in the mine. The tailings could be worked at pleasure, and there being no expenses of mining to undergo, or of crushing, the stuff put through the second time would net more than it did the first time. As has been well understood, many mines have been run simply for what is known as a "milling proposition," that is to say there was more to be made in the milling than the mining part of the business. These facts are well known, and although many attempts have been made to break up the system, it is still in vogue. To obviate any further stealings in this line, Johnson, of Sacramento, will shortly introduce the following bill in the Legislature, in accordance with previous notice:

SECTION 1. It shall be the duty of the directors, trustees or managing officers of any mining corporation organized under the provisions of the laws of this State, or doing business in this State, to work or cause to be worked, the tailings of the mines owned or operated or managed by said corporation for the benefit of said corporation and its stockholders; and it shall be unlawful for the directors, trustees or managing officers of any such corporation to work or cause to be worked said tailings in any other manner, or to make any contract or contracts with any person or persons or corporation by which the tailings of the mine or mines owned or operated or managed by said corporation shall be given or received as payment in any manner for the reduction of the ores of said mine or mines.

SEC. 2. A violation of the provisions of section 1 of this Act shall be a misdemeanor, and punishable by a fine of not less than \$500 and imprisonment in the county jail not less than six months, and any director, trustee or managing officer of any corporation convicted thereof shall be deprived of his office, and shall forfeit \$1,000 to such corporation.

SEC. 3 This Act shall take effect immediately, and all Acts and parts of Acts inconsistent herewith are hereby repealed.

BUSINESS CHANGE.—As will be noticed in our advertising columns, the partnership heretofore existing between A. T. Dewey, W. B. Ewer, Geo. H. Strong and John L. Boone, in the Patent Soliciting business connected with this paper, has been dissolved, by the withdrawal of Mr. Boone from the firm. Our Patent Agency business will be managed, as heretofore, by Mr. Geo. H. Strong, and our clients can depend upon receiving as courteous and skillful attention as heretofore. This transaction does not in any manner affect the newspaper business of Dewey & Co. Mr. Boone intends to occupy himself principally with Patent law in the future, and has opened an office at room 57, Halleck block, No. 320 Sansome street, southeast corner Sansome and Sacramento streets. Go up in the elevator and see him. Mr. Boone has exceedingly promising talent for the new field of Patent law practice which he enters, and we wish him abundant success.

THE California Commissioners have abandoned the attempt to make any exhibit of California products at the Paris exhibition, the Legislature having failed to make an appropriation. The mineral exhibit will be sent, however, by the generosity of a private citizen of Nevada, Mr. J. W. Mackay.

The Lead Market.

We have received a review of the lead market for the year 1877, from Edward A. Caswell, a leading lead broker of New York city. He places the total supply of the United States, during the past year, at 79,549 gross tons, and the amount manufactured at 73,804 gross tons, a surplus of supply over consumption of 5,000. His prediction that the limit of low prices had been reached and that it would not fall below four cents, is not verified, as our latest quotations are three and eight-tenths cents per pound. We extract the following from his circular:

Although the prices of common lead in New York has been below five and a half cents, currency, since July 1st, and has been below four and three-quarter cents, currency, for nearly four months past, the total increase in home production of this year over last year is 15,915 gross tons, or 28%, which is greater, in point of quantity, than any yearly increase ever experienced in this country. It would seem, therefore, fair to conclude that the country can produce enough lead for its demands, even at present rates, for it must be noted that the entire supply of the year has been evenly produced. The first half of the year turned out 55% of the total annual yield. The third quarter turned out about 20% and the last quarter the remaining 25%. Virtually all the lead that has been made in the last three months, was underground, in August, when the New York price touched five cents, and it has been taken out since then in face of the facts of declining prices and discouraging prospects. If producers had been losing money ever since common lead had good-bye forever to the price of six cents in New York, would they, notwithstanding a continuance of price below five cents, have turned out in October, November and December the full average for a quarter of the year? It would certainly seem in this case that actions speak louder than words. We are still informed that all Utah will soon get finally cleaned up and shut down, and that the army of Missouri miners will no longer prospect, but fold their tents and silently steal away to parts unknown. In either case the price of lead would advance, unless meanwhile the high-grade silver ores of the Far West are sufficient to entirely supply the country, and while this result is without question probably a few years hence, it is equally an impossibility to-day.

It would be a natural deduction to presume either that at six cents in New York, lead producers were making enormous profits or else were being ruined with lead at four cents. Such, however, is not the case. With the decline in lead have come greater economy in mining, more care in dressing and concentrating ores, less loss up the chimney and reduction in the cost of labor, material and freights, so that thousands of dollars, which were formerly thrown away because there was still a profit, are now necessarily saved in order to make a profit.

The dangerous competitors of Missouri miners, to-day, are not reductions in the tariff, but increase of the argentiferous lead productions. Territories which have advanced the figures of their collective output in five years' time by steadily increasing steps from 13,000 tons to over 45,000 tons, may well be regarded with apprehension and their growth be watched with jealous interest.

Economy in Working Mines.

The Gold Hill News, says: Many cases could be cited where mines lying side by side on the Comstock could have often times saved to the present stockholders thousands of dollars had they been operated together in a friendly spirit. It has often occurred, sometimes through cases of contending titles and sometimes without any apparent reason, that drifts when opened between two neighboring mines have been closed by the one party or the other, thus cutting off the cooling, health-giving ventilation so much needed and leaving each to struggle with the situation as best they could, when by making proper connections and assisting in the ventilation of each other's mines, their men would have been enabled to do double the amount of work, and the speed with which their prospecting could be performed have been greatly accelerated, as well as the cost diminished.

Many of our mines cover a small space of ground, and if properly worked together, by means of joint shafts and hoisting machinery, might save at least one-half of the first cost, as well as one-half of the cost of running, to each mine. In addition to this, how much more economical it would be for mining companies to join together in driving prospecting drifts and winzes for ventilation on the lines of separation, each paying one-half the cost. One set of hoisting works, and shaft with three or four working compartments, would be amply sufficient to drain and work 1,200 feet of ground at any point on the lode. Some of our mines, for instance the Consolidated Virginia and California, are worked in this way, greatly to the advantage of each company. Even in the case of disputed titles, how much more manly it would be for two mining companies to quietly prospect the disputed ground if they wish, make all proper air connections in a friendly spirit, and then go into a court of law and settle their claims in a legal manner. No matter how much fighting they may do, or how many lives are sacrificed, that is what must be done in the end; and certainly, if this were done in

a peaceful and friendly manner, it would be far better for all concerned.

Times are too hard and the outside stock-holding portion of the people too poor to have a dollar of their money expended unnecessarily. The plea may be made that when such agreements are made between two mine managements that one or the other may not fulfill their part of the contract in keeping shafts and drifts open and in proper repair. In such cases let the strongest legal contracts be drawn, and each company be bonded in the premises—not only that, but in case of carelessness or neglect on the part of either to perform their proper duties, the other contracting parties should be fully empowered to do it for them, and then to charge up the cost as confessed judgment and collect it as such. The Hale & Norcross, Savags and Gould & Curry mines have just such working agreements now, and it certainly would be well for many others of our mining companies to follow the example they have set.

Out in Bodie.

Judge Knox, of this city, yesterday received a letter from Bodie from an acquaintance who recently went to that camp from the Comstock. The letter is dated February 2d, and the writer appears to be well pleased with the camp, though he and a big storm struck it at about the same time.

The writer says: "It began storming two hours after I landed, and continued four days and nights, and I do think it was the severest I ever witnessed. After the storm cleared away we rented a shop and made sleds. Since then I have had jobs at building, and am making about \$6 per day, with a prospect of plenty to do if the road keeps open so that material can be had. Some teams came in yesterday that were out 15 days between Carson and this place, and some have been four days in coming here from Aurora, a distance of 10 miles.

"I think Bodie bids fair to be one of the liveliest camps on the coast next summer. There appears to be no longer a doubt in regard to the richness of the mines, and so far as I am informed they are not confined to a small district, but extend south to Mono lake, and perhaps much further.

"The town of Bodie is situated on a flat, said to be 2,000 feet higher than Mount Davidson. God knows it is high enough for me! The flat is about two miles in length by half a mile in width, and contains at present about 175 or 180 houses and cabins. All classes of business are represented. We have hotels, restaurants, stores of all kinds, blacksmith shops, tailor shops, jewelry shops, and plenty of whisky mills and other mills that will not be mentioned.

"As regards mines, the Syndicate have a mill in Bodie Canyon and are taking out ore of high grade; the Bechtel are taking out ore of good quality; the Standard company also have a valuable mine, with a mill in full blast. These mines, with others not mentioned, are situated east of the town on the apex of the mountain, 600 to 800 feet higher than the town.

"The Standard mill is on the flat east of town, and they have a tramway from the mine down to the mill, a distance of 1,000 feet, for transporting the ore from the mine to the mill. The ore is carried in iron buckets on a wire cable on the principle of an endless chain.

"There are other mines in the same range, which I will merely mention. These are the McClinton, the Bellevue, Bodie, South Standard, Red Cloud, ex-Governor Blaisdell, Superintendent; Black Hawk, Sam. Ferguson, Superintendent; Aurora Tunnel, and Champion, the latter bonded to John Wagner, of Carson, for \$40,000. All these mines are within one mile and a half of this place, and there are others still further south—the Bull-whacker, University, Glen, Orient, Mary Ann and many more.

"Tell all who talk of coming to Bodie to speculate without money to stay at home, as the place is overrun with men seeking employment; and, in addition to that, nothing but coin buys grub here—cheek will not do."—*Virginia Enterprise*.

TRICKS THAT ARE VAIN.—One of our mine owners recently contracted with a couple of brawny miners to sink a shaft on his claim to the depth of 100 feet. The men went to work with a vim, and at the end of a month reported the work completed and ready for inspection. The gentleman had furnished them with a rope 100 feet long for hoisting purposes, but, to have a sure thing on the measure, he took along a tape line. On arriving at the shaft, one of the miners descended, and all of the rope reeled off of the windlass, proving that it was 100 feet deep, but to make assurance doubly sure, he fastened a stone to the end of his tape line and let it down until it played out the same number of feet. That satisfied him, and he paid the men \$500 for their month's labor. They left for Grass Valley, Cal., and a week afterward the owner again visited the location and made the singular discovery that the shaft had shrunk 25 feet and was only 75 feet deep. The rope had also shortened the same amount, but as there was no interested party down in the shaft to reel out 25 feet on the tape line, that article held out. Now he says that "for ways that are dark and tricks that are vain, these miners were peculiar." He figures his loss at \$125 on the 25 feet, and the price of 25 feet of braided rope, cut off and thrown away. The boys did not work exactly with the "Golden Rule." The next men that try that game will probably listen to the old refrain, "Oh! not for Joe!"—*Eureka Sentinel*.

Sonoma County Mining Interests.

That Sonoma county abounds in mineral wealth is a demonstrated fact. Especially is it rich in deposits of quicksilver. As regards gold and silver we are not much inclined to believe that rich minerals of those kinds exist within our boundaries, although good traces of both are frequently discovered. Rich copper ore has been found in several parts of the county, and it is the opinion of experts that some time in the future good mines of this description will be opened on some of these partially developed ledges.

The development of our mineral resources has had, and will continue to have for some time to come, a slow growth. This is attributable to the fact that better fields for the miner are presented in some other parts of the State, and Sonoma county is regarded as an agricultural section. However, enough interest has been previously taken in our mineral wealth to lead to the discovery and partial development of some rich claims, principally cinnabar. The quicksilver excitement of '73 and '74 brought hundreds of prospectors and capitalists to Sonoma, and for a time it seemed that a new and more prosperous era had dawned for us. As many are already aware, the decline in the market value of quicksilver put a damper on the growing mining interests, and resulted finally in almost a cessation of work in that direction. During the brief season of excitement a mining town was established, many claims changed hands, tons of machinery were imported and hundreds of thousands of dollars were brought into the county. Some of the mines then located have been constantly worked, and if there has not been much profit resulting therefrom it is because the owners are holding back developments and shipments in anticipation of a rise in the price of mercury.

In the vicinity of the Geysers and also in the section southwest of Healdsburg good cinnabar mines are now in operation, the companies owning them having made improvements to the extent of many thousands of dollars. Their money has not been expended blindly, and therefore the extensive improvements are evidences of much wealth yet to be developed. We expect to see the day, and not far distant either, when the cinnabar and copper mines of Sonoma county will rank with the best on the coast.

If an interest in our mines should be stirred up in Healdsburg, so as to induce prospectors and capitalists to again flock in and make the canyons echo with the sound of the pick, it is our firm belief that it would never again be allowed to wane as it has within the past few years. Quicksilver is worth more than its present market price, and could the combination now controlling it be broken, it would need no invitation to interest capitalists in our mines.—*Healdsburg Enterprise*.

The Outlook.

The unparalleled prosperity and magnificent developments in our two principal mines, the Eureka Consolidated and Richmond, and the general outlook all along the lode is a source of encouragement and a subject for congratulation among all interested in the welfare of Eureka. The steady and uninterrupted outward flow of bullion that has characterized them for months past, and one that promises to be indefinitely continued in the future, stamp the Base range as one of the most important silver-producing regions in the world, both in scope and productiveness. We now yield the palm to only one district, the Comstock, and we are audacious enough to believe that the time will come when we will rival our lordly neighbor. Of course we do not institute any present comparison, as the output of that wonderful lode admits of none, but our prospects at the present writing are so bright that it is allowable for us to indulge in some slight exultation. From the first discovery up to date, there has been very little of the hurrah or furore that has attended almost every other camp in the State, but we have gone on steadily improving, learning more applicable processes by experiment and making the most of our resources, until we have arrived at a clear understanding of the value and extent of the grand deposits that underlie the mountains and hills in this vicinity. Deep working has proved their permanence, and, as depth is obtained, the ore bodies are more extended and of higher grade. Throughout the district the greatest activity prevails and many properties are coming into prominence by sheer merit and value of developments. Since last September we have sent abroad \$1,000,000 per month, and as spring opens and work is inaugurated, it is probable that this amount will be increased one-third. The direct effect of this state of affairs has been to start an era of improvements and the town is taking upon itself airs—substantial buildings, elegant business structures and cosy private residences going up as if by magic. Notwithstanding this increase, we doubt there being an eligible house to let in town and the demand is far beyond the supply. We are of the opinion that next summer will be the liveliest season ever experienced on the Base range, and we are home out in our opinion by the present situation.—*Eureka Sentinel*.

The great heat in the Ophir is being rapidly overcome, and work is being resumed in all the drifts and winzes to-day, so that if nothing further happens to prevent, we must soon begin to learn the true value of the recent discoveries on the lower levels of that mine.

New Mexican Mines.

A Georgetown, N. M. correspondent of the *New Mexico Herald* says: Thinking that your many readers would like to be kept posted in regard to the progress of this little hurg, I beg leave to present the following facts for the information of such as choose to know them. In the first place I will state that there are now here between 400 and 500 persons, and in the immediate vicinity 200 additional population—men who are not idle by any means, but on the contrary, are following the different occupations of mining, farming, prospecting, etc.

I might mention in regard to mining interests, that your former correspondent was mistaken in respect to the amount of work done on the different mines. The Mimbre Mining and Reduction Works Co. have now in their employ, and have had for several months, a force of over 30 men; and are furnishing to the mills more good ore than has ever been produced by any corporation in the county since the Smith & Tower bonanza. Mr. E. Weeks is also employing a dozen men in Silver city, in the "Legal Tender" mine, which bids fair to excel in the quantity and richness of its production any mine in this vicinity. Mr. Weeks is also general superintendent of the mines belonging to M. M. & R. W.'s Co. in this place, and to his personal supervision and sagacity is due much of the success which attends them. The Messrs. Smith, McGregor, Meridith & Ailman, Stevens & Walters, Holt and Moulton, and other mine-owners and lessors, are indefatigable—working day, and some of them night-shifts; and what is best are all and individually making it pay.

I might mention many others here who are doing well, but there are so many leasing and successfully so, that should I not mention all, I might give offense to others equally deserving. I will merely say that Georgetown as a mining center will eventually rank with any mining town of recent date. I had nearly forgotten to mention that David Winterburn, who has located ground about three miles from here and represents it, brought in some ore a few days since, which was pronounced by experts to be of a very high grade.

I presume I have trespassed already on your valuable space, and will merely mention in conclusion that the M. M. & R. W.'s Co. are running a tunnel on the north side of Parapet mountain, and have now entered about 350 feet. The work is being pushed forward night and day and is of great importance, as this tunnel is intended, not only as a drain, but will supersede the necessity of hoisting-machinery in order to get the ores to the surface.

There is still considerable snow on the north slopes of the mountains, which retards prospecting to some extent.

DOWN IN THE LOWER LEVELS.—Not many men who see the miners of the Savage lifted out at the top of the shaft at change of shift have the courage to descend into the lower regions of that mine. Very few even of the old residents of the Comstock would care to descend into the steaming regions below, and not one Eastern man in a thousand could be induced to make the trip after seeing the men popped out at this top of the shaft, steaming as though just lifted from out of a cauldron of boiling water. Though they are shirtless—naked as at birth from the waist up—and wear only cotton overalls, they are dripping as if but a moment out of a pond of water; yet this is all from steam and perspiration. In all this great heat men must work. The wonder is that they are able to do anything but gasp and pant. It is a place better fitted for salamanders than for men. At the head of the main incline, where they have so long been engaged in putting in the V-bob, it is as hot as in the hottest vapor baths at Steam-hoat springs. One would think that men much in such a place would be quite secure against the rheumatism. On making inquiries in this regard of an underground foreman, he said that he never knew of any of the men working below to have the rheumatism. Some of our sufferers from the disease might try this cure—might have themselves lowered into the depths of the mine, there to sit and steam through one shift per day. But for the immense quantities of ice water they drink, the men could not endure the great heat in which they are placed or the floods of perspiration pumped from their pores. They swallow gallons on gallons of it, and it never hurts them in the least.—*Virginia Enterprise*.

THE EBERHARDT TUNNEL.—Last Sunday, we paid a visit to the Eberhardt tunnel. It has now reached a length of 2,600 feet, and is being driven at the rate of between six and seven feet per day. There is no apparent change in the formation for the last 200 feet, spar and lime constituting the component parts thereof. It requires only about 400 feet more for the tunnel to reach the neighborhood of the old Eberhardt mine. In the drift run on the vein struck at the 1,000-foot, two men only are employed. The drift is in about 30 feet, with no material change, the assays only ranging about \$10 per ton.—*White Pine News*.

THE January product of the Consolidated Virginia mine was \$1,613,162. This is the largest monthly product in upwards of a year, and disappoints those who expected the mine was worked out at the annual meeting in January. The proportions were as follows: Gold, \$747,925.10; silver, \$865,636.92; total, \$1,613,162.02.

MECHANICAL PROGRESS.

Gas for Fifty Cents Per Thousand.

A Philadelphia press despatch, under date of January 12th, says: The trustees of the Philadelphia gas works, which are owned and conducted by the city government, have for some time been examining a new process for producing burning gas, thereby, it is claimed, that gas can be manufactured at a cost of from 20 to 35 cents per 1,000 feet, a great reduction as compared with the \$2.25 per 1,000 which consumers are obliged to pay in this city. By the new process it is proposed to use what is called the slack or refuse bituminous coal dust, which can be delivered here at about \$2.75 per ton, instead of the lump coal now used, for which, according to the official reports for last year, the city was obliged to pay \$6.70 per ton. Another alleged advantage in the new plan is that the dust is injected into the retorts in a continuous current of dust mingled with steam, being instantly converted into gas, purer and with less waste of time and material than by the present practice of filling the retorts with about 200 pounds of coal which has to be baked several hours to yield only 20 pounds of impure gas, leaving a residuum of 180 pounds of coke, tar, etc., and injuring the retorts by sudden cooling and heating in the process of changing and withdrawing. The inventor of the new process, a gentleman from Washington, D. C., offers this city the free use of his patent and improvements, provided the public are benefited by selling the gas to the consumers at 50 cents per 1,000 feet, which can be done, he claims, and still leave a handsome profit to the city. The gas trustees have examined the plans of the inventor of the automatic, or steam coal process, as he calls it, and have authorized him to experiment with his new method, provided the city is not obliged to pay the expense, this body not having the right to spend any of their appropriations for such purposes without the special approval of the corporation. The inventor to-day addressed a communication to the mayor, formally repeating his offer to make the city a present of the use of the patent, and guaranteeing the city a saving of from \$1,000 to \$1,500 a day on the 9,000,000 feet of gas manufactured here every 24 hours.

VALVE MOTION FOR ENGINES.—An improved device has been introduced for operating the slide valve of a steam engine from the piston rod of the engine, in such a way that the valve will be moved slightly to partially uncover the inlet and exhaust ports as the piston completes its stroke. By this means its motion is continued in the same direction as the piston begins to move upon the return stroke, until the ports are fully opened, and then stand still, with the ports fully open, until the piston has nearly completed its return stroke. The arrangement by which this is accomplished consists in the combination of a three-armed bar, two levers, connecting bar, and connecting lever with the piston rod and the valve stem of a steam engine—also the combination of a lock-bar, spring, two cylinders, and pin with the two levers and the three-armed bar. Now, as the piston approaches the end of its stroke, the upper end of an upright arm of a bar strikes the concave side of the upper part of the levers operating it, and moving the slide valve to close the ports, and admit steam in front of the piston. As the piston, therefore, begins its return stroke, the inclined upper surface of one of the side arms of the three-armed lever bar comes in contact with the lower end of the lever, and continues its motion in the same direction—the effect of this being to fully open the inlet port, which remains thus until the piston has nearly completed its stroke.

THE MANUFACTURE OF ALUMINIUM.—In the most unique factory for the production of aluminium metal in Salindres, near Alais, the mineral bauxite is heated with soda in a reverberatory furnace, the resulting aluminate of soda is extracted by means of water and alumina, precipitated by a stream of carbonic acid; this is then formed into balls, with salt and coal, and heated to a white heat in vertical retorts, during the introduction of chlorine gas. The double chloride of soda and alumina, which distills over, is fused with the addition of 35% of sodium, and 40% of cryolite as a flux, and the metal which settles at the bottom of the crucible is poured into molds. The cost of producing one keg of aluminium is stated to be 80 francs; while the selling price is 100 francs.

TURKISH CARTRIDGE WORKS.—A private letter from Constantinople, says the *Iron Age*, states that some new large cartridge works, capable of turning out 500,000 per day (or 350,000 with Turkish labor), have been commenced at Zelinbourna, on the Sea of Marmora, about four miles from Constantinople. The contract for the whole of the machinery has been taken by the Winchester Repeating Arms Co. of New Haven, U. S., who are shipping 700 tons. The rolling mill for the strip, together with furnaces and engines, and the lead-squirting presses, are in the hands of Messrs. Greenwood & Battey, of Leeds. This establishment when finished will absorb the smaller factory at present at Constantinople.

Notes on Engine Construction.

We read in English exchanges of an invention brought out by English inventors, which consists of a construction and arrangement of combination of the parts of steam-engines, whereby simplicity of construction and compactness of parts and economy in manufacture are obtained. They cast the bed, the front cylinder cover, the two bearings of the crank shaft and the guides in one piece, the lower edge of the said bed being stiffened by a flange, as well as the upper edge. The upper flange of the bed for a portion of its length is planed and forms the guide for the cross-head. They place the eccentric sheave between one of the crank shaft-bearings and the crank, and they cast a hole in the side of the bed to allow the eccentric rod to pass through. They bolt the feed-pump to the back of the steam-chest and actuate the plunger of the feed-pump by the slide valve-spindle, which is carried through a stuffing-box at the back of the steam-chest. They construct the connecting-rod of cast-steel, having in section the figure of the letter H, the small end being bored out for the brasses of the cross-head pin. The front brass has a projection cast on it, which fits a corresponding groove in the connecting-rod. Two screws, tapped into lugs on the connecting-rod, bear on the said projection of the front brass and are used for taking up the wear of the brasses. They construct the cross-head of cast-steel and a strong pin being cast on the upper side of the said cross-head; on the said pin the lower guide-slipper is placed and on this the upper slipper, lock-nuts being afterwards screwed on for the purpose of taking up the wear. The pin described on the cross-head is cast hollow and serves the purpose of oil-cup or lubricator.

TO FIND THE WEIGHT OF A CASTING FROM THAT OF THE PATTERN.—In order to determine beforehand the weight of the finished article when cast (in whatever metal), it is necessary, says the *Zeitschrift der Eisen und Stahl-Industrie*, to know that the specific gravity both of the pattern or model as well as the metal to be cast. The contraction or shrinkage of the casting must also be taken into account—in the case of iron, this is in the proportion of one to 32. If we designate in general the specific gravity of the model as s , the specific gravity of the casting as S , the ratio of shrinkage as a , the absolute weight of the model as M and that of the casting as C , we shall have the general formula:

$$C = \frac{M \times S (a-1)}{s \times a}$$

By means of this formula, the weight of the casting, C , can be calculated for individual cases. To find the approximate weight of iron castings from that of the wooden pattern, the latter is multiplied by the figures corresponding to the material as given in the following table. Very accurate results cannot be expected, as the specific gravity of the wood as well as of the iron fluctuates: Pine wood, 14.0; oak wood, 9.0; beech wood, 9.7; linden wood, 13.4; birch wood, 10.6; alder wood, 12.6; pear tree wood, 10.

GALVANIZING IRON.—The iron to be galvanized is first immersed in a bath of diluted sulphuric acid, then washed in water. The articles are then passed to a workman, who removes any scale that may still remain on the surface with a scraping tool provided for the purpose. After having passed his inspection, the iron is immersed in a bath of dilute muriatic acid, from which it is shortly taken and removed (without washing) into a drying chamber, on emerging from which it is ready for the zinc bath. The dipping process occupies about 10 to 15 seconds with sheet iron and with cast-iron objects somewhat longer. The acid and washing tubs, drying oven and metal bath are so disposed with relation to each other as to make the several manipulations as continuous as possible without loss of time. The slight incrustation of chloride which remains upon the iron after it comes from the drying room, appears not only not to interfere with the zincing but to favor the operation. With every operation a trifling quantity of iron from the object immersed therein enters the zinc bath and in course of time forms what appears to be an alloy of zinc and iron, which slowly accumulates in form of a spongy mass at the bottom of the pot, from which it must from time to time be removed with a shovel or scoop provided for the purpose, while fresh zinc must be added from time to time.

SCALE OF MODELS AT THE PARIS EXPOSITION.—The following suggestion is made by a correspondent of the *London Times*: "It may be valuable to those of your readers who intend to exhibit plans or models to know that these can be made to a scale capable of being expressed in any language. The only common measures between English feet and inches and foreign decimal scales are the numbers 2 and 10, so the only possible international scales are the following: Full size=*grandeur naturelle*; half full size, or 6 in.=1 ft.=1*la moite* ou .5; quarter full size, or 3 in.=1 ft.=.25; half quart or .25; 1 1/2 in.=1 ft.=.125; 3/4 in.=1 ft.=.0625. Or 1/10th of any of the above, viz.: 12-10 in.=1 ft.=.1; 6-10 in.=1 ft.=.5; 3-10 in.=1 ft.=.025; 3-10 in.=1 ft.=.0125; 3-40 in.=1 ft.=.00625. A drawing has only to be made to any of these scales, and marked with the English words, and the corresponding decimal will be understood all over the world."

SCIENTIFIC PROGRESS.

Science and Invention.

It is frequently asserted that it is by men of small education that great inventions are made. In a recent lecture, Prof. Becker, of the State University, says the assertion is incorrect, and cites the following instances: James Watt was a civil engineer and an accomplished scientific man; he had been connected with the University of Glasgow for years before his friend Robinson, Professor of Physics, suggested to him to try to utilize the enormous motive power of steam. George Stephenson had studied science ardently for years and had the assistance of his only less eminent son Robert, on whose education no pains had been spared, before he invented the tubular boiler, which is the essential feature of the locomotive. Electricity was first applied to telegraphic purposes by Gauss, one of the profoundest mathematicians and physicists who ever lived. The electric telegraph was independently invented and first applied to commercial purposes by Morse, who had graduated at Yale and who was Professor of the Fine Arts in another college. Whitney, the inventor of the cotton-gin, was a Yale graduate. The first practical reaper was invented by the Rev. Peter Bell, a Scotchman. Nasmyth, the inventor of the steam-hammer, was a University of Edinburgh man. The safety-lamp was the invention of the great seaven, Sir Humphry Davy. Sir William Armstrong, of the hydraulic and artillery fame, was well trained in science and studied and practiced law. The greatest farmer who ever lived was undoubtedly Liebig. Murdoch introduced the use of illuminating gas as the result of a scientific investigation on the products of the dry distillation of matter. Siemens, whose wonderful furnace and its modifications represent a yearly economy of several million tons of coal, is one of the most highly educated men alive. In short, it is only rarely that genius, deprived of the assistance of antecedent experience and thought, has been able to arrive at results which have notably modified the industrial condition of mankind. The Greenwich observatory and the astronomers who have pursued their studies in it, by rendering navigation safe and its extension possible, have contributed as greatly to the welfare of mankind as the locomotive and its inventor; and what could we do with our iron ships if the laws of magnetism, as well as those of astronomy, had not been investigated? Volta's curious experiments paved the way to the electrolyte, and Morse would have been impossible had not Franklin preceded him. To make Bessemer steel we call in the help of spectral analysis, our sugars are bought and sold according to their effects upon the plane of polarization of light, and most of our chemical manufactures are founded upon facts and laws which were discovered not in pursuit of money, but of truth. Science is not indebted to the world for the thousands it annually costs, but the world to it for tens of millions of its yearly profits.

MICROSCOPIC EXAMINATION OF CRYSTALS.—Dr. P. T. Austin, in the *London Chemical News*, gives the following method of preparing crystals for examination by the microscope as much better than the usual way of evaporating the solution in a watch-glass and rubbing with a glass rod: "If the solution be evaporated to the right consistency in a watch-glass and another watch-glass of the same size, previously warmed, he placed upon it, the drop expands to a film. The upper glass should not be pressed, but allowed to rest of itself. The film is similar to the one obtained in an animalcula, being, however, thicker. If now a few drops of ether be placed in the upper watch-glass, the cold caused by the evaporation of the ether will cause a crystallization to take place between the watch-glasses. The growth of the crystals can be quite accurately managed by increasing or diminishing the cold on the surface (by blowing on the ether). The crystals formed are, as a rule, perfect in shape. I have by these means obtained well defined crystals from solutions which, by rubbing with glass rods, afforded me only amorphous powders."

NEW CARBON BATTERY.—M. Jabluchoff, says *Comptes Rendus*, melts nitrate of potash or nitrate of soda, in which he plunges ordinary coke carbon as the active plate, the platinum as the inactive plate. Iron, or any other metal which, in presence of the carbon, is not attacked by the melted salt, may be substituted for the platinum. By adding different metallic salts, the electromotive force of the battery may be varied between two and three units; it is, therefore, superior to that of the Bunsen and Grenet batteries. The galvano-plastic deposits of the metals may be received at the inactive electrode. During the action of the battery there is a great liberation of carbonic acid and other gases. M. Jabluchoff describes an arrangement for collecting them, so that the combustion of the carbon may give simultaneously an electric current, a metallic deposit, and a motive force.

LYCAENA PSEUDARGIOLUS.—The *Canadian Entomologist* contains notes on this butterfly with its larval history fully recorded, by the distinguished Virginia entomologist, W. H. Edwards. It is a paper of great interest to students of the lepidoptera. The *Entomologist* begins the new year with an excellent number.

Simple Illustrations of the Laws of Gravity.

Teachers can do much to impress scientific facts and laws upon the minds of their scholars by using simple illustrations. A hint of this is given by Thomas B. Lovell, in *Barnes' Educational Monthly*: Some years ago I heard an excellent teacher lecture on a subject pertaining to astronomy, in which he made use of several experiments. First, to illustrate that a body will always revolve on its center of gravity; second, to show why the earth is flattened at the poles. These experiments could be performed by means of apparatus found in almost every schoolboy's pocket, namely, a piece of string, a lead pencil or a short stick, and a piece of brass or steel chain not larger than a small watch chain. Tie to the middle of a lead pencil a piece of string about three feet long. Suspend so that the pencil will balance itself. Now twist the end of the string between the thumb and the first finger of the right hand, steadying and holding the string with the left hand. A circular motion will thus be communicated to the pencil, and it will revolve around the point on which it is suspended. Tie a piece of white string around the middle of the pencil, or its center of gravity, simply to show the position of that point. Now, again tie the first piece of string half way between the end of the pencil and the center of gravity, and communicate the circular motion described above, and we shall observe that the pencil will still revolve around its center of gravity, the point marked by the white string being at rest. It can thus be shown that anything, of whatever shape, will revolve on its shortest diameter. If the end links of the chain referred to above be hooked together, and the string tied to a link and the circular motion given, it will be observed that the chain begins to take an elliptical form, which gradually approaches that of a circle, until at last it becomes a circle and then it revolves horizontally. This shows that even a ring is subject to the same law, that is, revolves on its shorter axis, the center of gravity. Simple as this experiment is, it illustrates the revolution of the earth on its shorter diameter.

Analysis of Colored Leaves.

Prof. A. H. Church, of the Royal Agricultural College at Cirencester, England, in the course of some investigations concerning chlorophyll (the green coloring matter of plants) was led to look into the chemical composition of the different parts of variegated leaves, and the results he has reached, and which are reviewed in the *Journal of Chemistry*, are exceedingly interesting. The experiments were made upon three plants, having green leaves variegated with white patches, or bearing both green and white leaves: a maple (*Acer negundo*), an ivy (*Hedera helix*), and a holly (*Ilex aquifolium*). The leaves were carefully galled without the use of knife or scissors, and were put into weighed bottles so that no moisture could be lost on the way to the laboratory. Such leaves only were taken as could be fairly compared in age and state of growth. The water, the combustible or volatile matter, and the ash were first determined; and the following are the tabulated results:

	Maple.		Holly.		Ivy.	
	White.	Green.	White.	Green.	White.	Green.
Water	82.83	72.70	74.14	62.33	78.88	66.13
Or. mat'r	15.15	24.22	23.66	35.41	18.74	31.63
Ash	2.02	3.08	2.20	2.47	2.38	2.24

The watery character of the white leaves, and their comparative poverty in combustible or so called "organic" constituents, is very marked. The fresh green leaves of all three plants contained about one-third more solid matter than the white leaves. The mineral matter or ash, when not absolutely more abundant in the white leaves, forms a larger part of their dry matter.

Of the matters soluble in ether, including wax or fat, resin, chlorophyll, and several other organic compounds, fresh white ivy leaves contained 1.29%, the green giving 3.27%. Similarly, white-holly leaves contained 1.75%, and green-holly 2.54%.

Even more remarkable differences in composition between white and green leaves were noticed on submitting the ashes of the several plants to quantitative analysis. It was observed that in the ash of all three plants there is the same kind of difference between the white and green parts. In the ash of the white parts potash abounds, and in the ash of the green parts lime; while in the ash of the white parts there is invariably a higher proportion of phosphates than in that of the green. There is, however, no indication that the presence of chlorophyll in the green parts involves a higher proportion of iron.

The experiments suggest an explanation of certain facts in the cultivation of variegated plants which have hitherto been inexplicable; as, for instance, that in some calcareous soils many such plants quickly revert to their normal green state.

CRYSTALLIZED GLASS.—M. Videau, director of the Blazy glass works, says the *Journal of Chemistry*, has obtained some fine specimens of crystallized glass from a crucible that had been running for eight months and a half in Siemens furnace. He hopes to obtain still better crystals, together with the "mother waters," from a furnace that seems likely to act for nine or ten months.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

AMADOR.

WABASH.—*Amador Ledger*, Feb. 16: This mine is located close to the Talisman, near Amador City. It was some months ago bonded for one year by Mr. Hammack, who immediately set to work to develop it on a small scale. He put up an astra, worked by a horizontal wheel by water power. This contrivance is capable of crushing about 1,300 pounds of quartz per day. Since the commencement of work numerous delays have occurred, owing to the uncertainty of the water supply. The richness of the ore so far crushed has exceeded expectations, and argues well for future prosperity. Three clean-ups have been had, all of which have yielded handsomely. The general average has reached the neighborhood of \$20 per ton. The present depth of the shaft is 40 feet, with a three-foot ledge at the bottom. In the honing of the property, Hammack has struck a good thing. He sees a fortune dancing tantalizingly before him, which threatens to slip from his grasp, owing to the meagre crushing facilities at his command.

BUNKER HILL.—This property looms up today as the richest mine in the county. Latterly the ore-body has opened out, unexpectedly rich. We understand that two ledges are being operated, one two feet and the other six feet in thickness. While both ledges are above the average, yet the smaller one is the richer of the two, and is perhaps the finest seam of quartz discovered on the line of the mother lode in Amador county for many years. An idea of the wealth may be gained from the fact that the last clean-up from both veins averaged \$35 per ton. When in Amador City the other day, we heard that the outlook is so encouraging that 10 more stamps are to be added to the mill forthwith—making 20 stamps in all—also, that the company contemplate building a car track from the mine to the mill—a distance of nearly half a mile.

KEYSTONE.—This magnificent property—the basis of Amador City's prosperity—move on in the even tenor of its way. The rock now being put through the mill is somewhat lower in grade than the average ore from this mine; nevertheless it is of good paying quality. The lode is in places 40 feet thick, all of which goes to mill. Little prospecting is going on, the immense size of the vein rendering exploration unnecessary at present. There is one thing for which the Keystone company are deserving of praise, and that is the regularity with which the employees are paid.

PLYMOUTH.—In this section, we are having one of our old-fashioned winters, when the dews of heaven fell, not in mist, but poured down in torrents. Every gulch and creek is filled with a roaring, turbulent tide. Farmers hereabout are unanimous in the idea that they have got all the water they want for the present. Miners are also satisfied and willing to cry, "hold, enough!" But quartz-mill men are still shouting to the clerk of the weather to pour it down and bring on a second edition of the deluge. Last week, the Phoenix mill had to be stopped for want of ore. When the 80-stamp first started this season, there was about 3,000 tons of ore on the dump. All this has been reduced. To keep the mill running to its full capacity, 160 tons of ore must be taken out daily from the south shaft. The new and powerful hoisting machinery is now being placed in position over the south shaft. Superintendent Jones is equal to the emergency and will see that the requisite amount of rock will be forthcoming.

HOISTING WORKS AFLOAT.—D. R. McKilligan's hoisting works, on his quartz lode, near the forks of the Cosumnes, started, during the late storm, en route for El Dorado county. Whether they are still navigating towards Oregon, or have called a halt, your correspondent knoweth not.

LUTE.

LAVA BEDS.—Mining in the Lava Beds has been almost suspended by the recent rains. Chinamen will not work in places where the banks are liable to cave if they can help it. It takes but a few lessons in dangerous mining to make them wide awake to anything that looks dangerous. In the gulches and ravines there is an abundance of water, and if there is any gold at all, it is dug out without much trouble. So far the returns from the small mines have not been great, but there is snow sufficient to keep up the water till late in the year.

CALAVERAS.

GRAVEL MINING.—*Calaveras Chronicle*, Feb. 16: We have never seen so much vigor shown by our gravel miners as they are evincing at present. Everybody is at work and operations are being pushed with a vim that can't help being successful. At the Garland mine in Chile gulch—now owned by Jilson & Co.—work goes on apace. A full force of drifters is employed and the mill—the gravel has to be put under stamps—is kept constantly running. Results, good. Brown & Co., the Tunnel ridge tunnelers, have reached the channel and are doing well. The gravel is hard to wash, and they will probably yet get as much out of the tailings as the original yield. They have ground sufficient to last them for years. In the well-known Duryea claim there is no cessation of

operations at all. Gravel is "drifted" as fast as the stamps can render it fit for washing. Veith, the great hydraulicist, works like a Trojan. The harder it storms the more enthusiastic he becomes and the faster he labors. Operations in his claim never lag. He always has a full head of water on and will clean-up a gunny sack full, pretty soon, as he deserves. Moser & Co. are also putting in their "best licks" and making 'em tell. Their claim is now very advantageously arranged and with the aid of a big head of water they are enabled to keep their flume running full. Moser & Co.'s receipts this year will be a nice fortune. Emerson, the Happy Valley gravel washer, is happy. He keeps 400 inches of water, under a heavy pressure, working for him. W. W. Cook, keeps piping away in his claim near the French Hospital. We understand that his claim is looking first-rate and yielding steadily. Cook, Raynor & Cook, proprietors of the Calaveras hydraulic, are piping steadily, a ditch owned by themselves supplying an abundance of water. Sliter & Co., who lately located in Old Woman's gulch, are doing first-rate. Quite a number of hands are employed and the prospects are excellent for the development of a first-class mine. The gravel is difficult to wash and we understand that the proprietors are already making arrangements for the erection of a mill.

INYO.

PROSPECTING.—*Inyo Independent*, Feb. 16: Callihan, Peel and others are working a promising ledge in the new Goldopolis district, in the Inyo range, some twenty miles northwest from here. They are building an astra for working the ore. Billy Lake is doing the assessment work on a large silver ledge nearly opposite Fish Springs. John R. Hughes and others have a small force at work in the new Beveridge district, referred to in an extract elsewhere.

REX MONTIS.—The Rex Montis mill, the pans of which were started up on tailings, was disabled and shut down on account of the bursting of one of the new Stevenson pans. Superintendent Hutchings immediately started to the Bay after new ones—those with wooden sides, probably. Work still goes on at the mine, though there is now no communication with those fellows up in the clouds and snow.

SILVER PEAK.—Superintendent J. B. Hiskey of the Silver Peak mine and mill, is conducting extensive operations over in that region. On the work are employed some fifty men, developing, erecting a new mill, etc. Bullion to the value of \$50,000 has been shipped so far, but a drop compared to what will be produced when the new works and processes are complete. This is a heavy New York company.

NEVADA.

SELBY HILL.—*Nevada Transcript*, Feb. 16: The Selby Hill mining company are working their claims up to their full capacity, using 650 inches of water. On Monday last they struck a very rich body of gravel, the extent of which is not known. Several pans of it were washed out, and the prospect showed from 25 cents' worth up to half an ounce to the pan. The run will be a long one, and when they do clean up we feel confident the result will exceed the most sanguine expectations of the owners. This is the claim which, not long since, many croakers asserted would not pay. Some of the ground was drifted years ago, and paid immensely, but a good portion of it has never been worked, because it could not be done in that manner.

THE SEASON.—*Grass Valley Union*, Feb. 16: Although the continuous rains have saturated the ground our mining companies are handling the water easily where steam machinery is used. The surface prospecting operations are interfered with, but even these are not entirely stopped, and some companies have been able to keep at work. Not much quartz can be taken to mill, however, when the haul is any distance, as the roads are in a bad condition generally, but this is only a temporary disadvantage, as the general mining situation is good, and active and prosperous mining season, through the coming spring and summer, is confidently looked forward to.

A VALUABLE MINE.—*San Juan Times*, Feb. 17: Joe Bynon & Co. of Birchville, have a very valuable claim on Shady creek, near and at what is known as Hoyt's crossing, which gives evidence of being very valuable. They own the bed of Shady creek from the head of Reader & Co's claims at the Falls, to the Empire dam above, more than a mile distant from the Falls. They have put in sluices at the lower end, and are ready for washing. They have constructed a tunnel through a hill a considerable distance, and will commence washing as soon as the storm subsides. The company anticipate good clean-ups, and we hope they will not be disappointed.

DEADWOOD.—*Nevada Gazette*, Feb. 16: The topic of conversation in town yesterday was the rich strike in the Deadwood mine. The owners have done some heavy work in the mine, believing that it was only a matter of time when a fine ledge would be uncovered, and they would be fully repaid for the money they were expending. On Thursday evening last they found a lode twenty inches in thickness, and the rock will go into the hundreds of dollars per ton. Work is being rapidly pushed ahead, and in a short time the true value of the discovery will be demonstrated.

We understand that Ehaugh & Lewey, whose quartz claim is near Kitts' mill at Willow valley, are taking out some splendid rock. The last crushing yielded \$2,400, or about \$55 per

ton. The quartz mines in that section are looking better than ever before, and the prospects are good for the discovery of many valuable ledges. Previous to the storm, a large amount of prospecting had been carried on, which will be continued as soon as the weather is favorable.

The "tailings" from Maltman's sulphuret works are to be worked over by an improved process. Extensive preparations are being made in the way of new machinery, etc., and the enterprise will be under full headway in the course of 10 or 15 days.

GEO. SMITH'S mine, on the Grass Valley road, is still paying as well as usual, and the yield is verifying our heretofore expressed opinion that it is one of the best claims in the county. Large quantities of rock is being taken out, and as soon as the Pioneer reduction works mill has finished the New England mine crushing, upon which it is at present engaged, the quartz from Smith's mine will be put through.

ANOTHER crushing of 60 loads of rock from the Centennial mine, near Grass Valley, is being put through the mill, and it is believed that it will go \$200 to the load. The ledge in the mine continues regular, although small in size, and is very rich.

The gravel mine known as the Hirshman mine, situated near Wet hill, is now in full working order; they now have sufficient water to run steady, and they expect a good clean-up.

DEBRIS WASHED OUT.—*Grass Valley Union*, Feb. 19: The heavy rain of Sunday caused the water to rise higher in Wolf creek than any time since the memorable winter of 1861-2, and, as a result, the mining sediment, which has been accumulating in the bed of the stream for several years, was washed out in many places down to the bedrock.

A NICE LITTLE CLEAN-UP.—Sixteen loads of rock from the Centennial mine were crushed at the Orleans mill, last week, and cleaned up \$2,000. The had condition of the roads prevented a large crushing, but the company have more of the same kind of rock on their dump.

Two men were killed by the falling of a timber, which was being lowered into the Idaho mine, on the 11th inst. Their names were James Buckett and John Polglase, the latter underground fireman.

TRINITY.

PAYING WELL.—*Trinity Journal*, Feb. 16: Jas. G. Trotter came in from Deadwood this week, bringing with him 210 ounces of retorted gold, valued at \$3,600. This is the result of less than a month's work with the astra on Trotter, Belleau & Co.'s mine, the quantity of rock crushed being 57 tons from the big ledge. The rock was not selected, but taken just as it came from the lode. Such a prospect on the Comstock would set California streets wild with excitement.

TUOLUMNE.

THE PHOENIX RESERVOIR SAFE.—*Tuolumne Independent*, Feb. 16: The report that the slide in the Phoenix reservoir, on Sullivan's creek, was caused by the incapacity of the flood-gates not being large enough to carry off the surplus water of the creek, is incorrect, as there are no flood-gates in the waste. More than this, the waste is of a capacity to take the water of the Stanislaus river, it being, at the apron, 85 feet—that is, at the outlet—and at the mouth over 150 feet wide, and eight feet deep below high water mark. The reservoir was built without regard to cost—some \$8,000 being expended in its construction. In building the dam it was thoroughly soaked from bottom to top. Its base is 125 feet wide, and every layer of two feet was flooded and soaked as the work progressed upward, making it as solid as it was possible to be made, and up to the time of the slide was as tight as a bottle. During the season the dam had dried in from the outside to a distance of about eight feet, and so hard that the rain ran over it without penetrating or making any impression upon it. But the continuous falling of snow and rain soaked through from the top down between the dry crust and the still moist interior of the dam. This made the earth inside so soft that the outside sloughed off, and the continued rain kept the remainder of the embankment so soft that it continued to work toward the inside until it got to the water, when it required the utmost exertions of a large force of workmen, night and day, to raise the levee sufficiently high to stop the water from coming through. The force of from 50 to 60 men employed finally succeeded; and although the expense will be heavy, it will be a permanent institution in the future, as it will be next to an impossibility for it to give way, let it rain as long as it may. This reservoir supplies a large section of country, embracing Shaw's flat, Sonora, Jamestown, Algerine, Quartz mountain, Montezuma, Rough and Ready, etc., and will hold in reserve, after water falls in the ditch, a four months' supply for the district named. As will be seen, an important section of the county is interested in its preservation, and the anxiety as to its condition warrants us in giving the above facts from a reliable source.

Nevada.

WASHOE DISTRICT.

CALIFORNIA.—*Gold Hill News*, Feb. 20: Owing to the continued storms, much trouble has been experienced in hauling the ore to the mills in Six-mile and Gold canyons. The reserve of ore has served, however, to keep the mills all running thus far, so that there has not yet been any interruption to the steady bullion production of the mine. The mills on the Carson river being supplied with ore by the railroad, suffer nothing by the condition of the roads,

but are, if anything, increasing the amount of ore they reduce. The ore stops in every portion of the mine, from the 1500 down to the 1650-ft level, are yielding the usual quantities of rich ore, keeping the ore dumps full to overflowing. Sinking the C. & C. shaft below the 1850-ft station is going steadily forward, the bottom still in very hard rock and the flow of water being very strong. On the 1550-ft level the upraise from crosscut No. 2 will be connected with the winze from the 1550-ft level to-day. This will greatly increase the circulation of air and facilitate the working of that portion of the mine. The north lateral drift from the shaft on that level is now in 144 feet.

CON. VIRGINIA.—Daily yield, 600 tons of ore. The mills are all kept busy crushing and thus far in the month nothing has happened to prevent the daily yield of bullion being fully up to the usual standard. The ore-producing sections of the mine are looking well in every part; in fact, there seems no prospect whatever of any decrease of the regular monthly returns of the mine. Sinking the C. & C. shaft has been resumed and is being pushed vigorously forward, the bottom still in very hard, tough blasting ground. The flow of water in this shaft is still strong. The east drift on the 1650-ft level, running to find the east ore vein, is being steadily advanced, a diamond drill being kept well in advance to prevent an inrush of water, which might flood the lower levels and do much damage if not prevented.

OPHIR.—The lining of the pumping compartment of the shaft has vastly improved the air circulation throughout the 1900-ft level, so that work has been resumed at all points in the mine excepting in the winze east of the ore body. Nothing is being done in that yet. The face of the main south drift east of the ore body on the 1900-ft level is still in porphyry, streaked with quartz and occasional clay chips. There is some water in the face of the drift, but it gives very little trouble.

JUSTICE.—The daily yield of ore has been increased to 130 tons, the intention being to start another mill in a day or two more. The Pacific mill is kept steadily crushing at the rate of 75 tons per day, and day before yesterday cleaned up their first shipment of \$13,395. The ore stops from the 1150-ft level up to the 800-ft level of the mine are showing splendidly, and yielding ore of a good quality.

SILVER HILL.—The prospecting on the lower levels is being pushed vigorously, the recent ore discovery on the 600-ft level giving great faith that when that portion of the ore vein is reached on the 800-ft level a veritable bonanza will be disclosed. The east crosscut on the 600-ft level, in which the ore was found, is still advancing the face still in lively vein matter carrying occasional streaks of quartz, portions of which continue to give good assays of both silver and gold. This is conclusive proof that the east side of the ore vein has not yet been reached, and holds out the hope that a larger body of rich ore may yet be found in that direction.

BULLION.—The upraise from the 1840-ft level and the bottom of the main incline completed a connection day before yesterday. The connection of the two shafts was perfect, neither being an inch out of line. The upraise is now being cut out, enlarged and thoroughly timbered, so that in a few days more the incline will be in complete working order down to the 1840-ft level. This will completely ventilate the mine to that depth, and will enable the crosscutting and prospecting of a large portion of the ore vein on that level that could not before be reached on account of the great heat.

BELCHER.—The pump shaft is down 28 feet below the 2260-ft station, the bottom in hard blasting rock. The pumps are now all in complete working order down to the 2160-ft level. The main east drift on the 2160-ft level is steadily advancing, the face in very favorable quartz. The east drift on the 2060-ft level is also making steady progress, the face showing more quartz of a much more healthy character.

NORTH CON. VIRGINIA.—Sinking the main shaft is being pushed forward with all possible vigor, the bottom still being in extremely hard blasting rock. This hard rock will continue for a distance of 30 feet or more downward, judging by the stratification passed through by the west drift on the 1300-ft level. The character of the material will then become much softer. The face of the west drift on the 1300-ft level is still in a soft, favorable character of ground, and is making good progress. The east drift on the same level continues in a very encouraging description of vein matter, affording low assays of silver and gold.

SIERRA NEVADA.—Sinking the south double incline winze below the 1700-ft level is making the best of progress, five feet being sunk and timbered every day. A strong force of men are employed and the development of the lower levels is being forwarded with all the speed possible.

MEXICAN.—The east drift on the northern boundary line, on the 1600-ft level, is steadily advancing, the face still in hard blasting quartz and porphyry of a very favorable character. The great heat is gradually decreasing so that much better progress can be made.

UNION CON.—The north drift on the 1600-ft level is steadily advancing, the face in hard blasting porphyry streaked with small veins of quartz. The south drift on the Mexican line is being driven vigorously forward, the face still in hard quartz and vein matter. The prospects in the face of this drift are quite favorable.

ALPHA.—Sinking the south winze on the Imperial north boundary is making steady pro-

THE ENGINEER.

A New Way Across the Continent.

The latest scheme for crossing the continent by rail seems to leave California and Oregon wholly out in the cold, and proposes to strike across from Norfolk, Virginia, to Topolavampo, on the west coast of Mexico, at latitude 25° 32' N. The advantages of such a route are painted in glowing colors, and it will be interesting to read the accounts, just to see how well the world can do without us. The accounts say that Topolavampo, or Topolobampo, occupies geographically the apex of the great commercial V of the North American continent; that is to say, that each and every port on the coast of the Atlantic ocean and the Gulf of Mexico, from Halifax, Nova Scotia, to Brazos de Santiago, and that each and every great center of industry and population in Canada, Nova Scotia, New Brunswick, and the United States, east of the Rocky mountains, the great lakes and the valley of the St. Lawrence, is nearer, and has less interruptions from topographic barriers and climatic extremes to Topolavampo than to San Diego, San Francisco or Puget sound. Data in support of these statements have been published in an official pamphlet (War Department). The demonstrations showing the advantages in distance cannot be refuted successfully, if the principles of Euclid are not in error. St. Louis, Mo., is 316 miles, and Chicago 221 miles nearer, as the crow flies, to Topolavampo than to San Francisco. Omaha, Neb., is 150 miles nearer to Topolavampo than to San Francisco, and Fort Worth, Texas, is over 400 miles nearer than to San Diego, and nearly 800 miles nearer than to San Francisco. New York is 340 miles, and Philadelphia 350 miles nearer to Topolavampo than to San Francisco.

While the Austin-Topolavampo indisputably will give a less track, and a less "equated" distance from all ports on the Eastern coast, and from all metropolitan centers in the Atlantic sections of our continent, it will also have a superior claim upon the through travel and traffic between Europe and Asia. In glancing at the Pacific, it is seen that San Francisco stands within 4,760 miles of Japan, yet vessels steam from her ports, 5,250 miles, so as to have the advantages of the upper edge of the trade-winds and currents which sweep towards Asia on and below the 30th parallel of north latitude. A steamer or sailing vessel from Magdalena bay, or from Cape St. Lucas, has stronger winds and currents for the Sandwich Islands, and all ports in Japan and China than from either San Francisco or San Diego—sufficient, it is believed, to almost overcome the disadvantages—the direct distances. The advantages a rail line would have from Norfolk to Topolavampo, over the route from New York to San Francisco, is 1,014 miles, and over that from New York to San Diego 651 miles. When the equated distances of the transcontinental lines are established and compared, the Norfolk-Topolavampo route will appear, it is thought, to still greater advantage.

Working of the Erie Canal.

Our Eastern exchanges say that Auditor Schuyler, of the canal department, will be compelled to report to the Legislature that the revenue from the canals this year is less than last, despite the lowering of the tolls on the chief articles transported, a policy of action which, it was asserted, would increase the canal income of the State. The tolls in 1876 brought in \$1,340,003, and in 1877 only \$880,866, or \$459,137 less; but the total number of tons carried has considerably increased. Western commerce has indeed been, in a measure, attracted back to the canals, as the advocates of low tolls claimed it would be. Thus, only 416,376 tons of wheat were transported in 1876, while in 1877 there were 445,846 tons. There was a corresponding rate of increase in the amount of other articles carried. Corn to the amount of 365,254 tons was transported in 1876, whereas in 1877 its bulk increased to 722,864 tons. There were 96,494 tons of harley carried in 1876; in 1877 there were 140,358. Also there were 759,374 tons of anthracite coal transported in 1876; in 1877 there were 975,028 tons. Altogether there were transported in 1876 materials weighing 4,172,129 tons; in 1877 materials weighing 4,879,013 tons, an increase for that year of 706,884 tons. To conclude, the gain in tonnage by lowering the tolls is about 17%. The loss in receipts from tolls is about 34%.

New York Elevated Railway.

This project for rapid transit in the city of New York now bids fair to be quickly realized. According to the *Iron Age*, the various establishments for the manufacture of ironwork under the recent contracts, are employing their entire force so that no default may occur. The Messrs. Whitney and Cornell together have a formidable job. All the large irons called for in their agreement will be made by the Pencoyd and Phoenix Iron Companies of Philadelphia. The former think they can increase their production so as to erect 20 spans per day, in addition to other work, the iron to be delivered at once. This week the work of erection will commence, beginning at Sixth street and Third avenue, and as regards the style of construction, the railroad company have decided to have a double track joined by transverse girders, mak-

ing it truly substantial. The united firms just mentioned take the road from the intersection of the Bowery and Third avenue to 61st street, on the east side, and from 53d street and Ninth avenue on the west side to 61st street, with a branch line from Third avenue through 42d street to the Grand Central Depot. The expectation is to have the entire work completed to Harlem river before the summer is ended. To erect 20 spans a day, as proposed, requires 140 tons of iron, from which fact some idea can be formed of the greatness of the undertaking.

Improving the Tennessee River.

We have alluded to this subject before. The movements are being pushed, and the *Iron Age* says that a committee of gentlemen composed of prominent manufacturers, merchants, professional men, agriculturists and operators of mines last week presented to the House Committee on Commerce at Washington, a memorial proposed by direction of the River Improvement Convention, which met at Chattanooga on the 5th of December last. The committee are drawn from Tennessee, Alabama, Georgia and North Carolina, and all vitally interested in the development of the great valley of the Tennessee and its tributaries and dependencies. The memorial recites, first, the size of the river, showing it to be of equal length and volume with the Ohio; second, its importance is demonstrated by the latent and visible resources which lie in its valley and the valleys of its tributaries; and, third, the nature of the main impediment to its navigation is discussed.

The average depth of the Tennessee river from its mouth to the obstructions, a distance of 296 miles, is fully three feet the year round. From Knoxville to the shoals, a distance of 551 miles, the average depth of the river is fully two and one half feet. Boats drawing four and five feet ply the year round from the foot of the shoals to the mouth. Boats of two and three feet draft run most of the year from the head of the shoals to Knoxville. Above the shoals, Little Tennessee, Clinch, Powells, French, Broad and Hiwassee rivers furnish 395 miles of available tributary navigation during about five months of the year. The nature of the shoals and the detailed operations of the engineers at that point, have already been pretty fully set forth in our columns. Major W. R. King, United States Engineer in charge of the improvement, says: "The estimate for improving Muscle Shoals, as submitted by Major Walter McFarland, in his report of 1873, was \$4,003,000; of which amount there has been appropriated at various times, \$1,035,000; of this latter sum about \$454,000 have been expended upon Muscle Shoals and \$260,000 at other points on the river, leaving a balance of \$321,000 to pay for work under existing contracts. The sum still to be appropriated is therefore \$3,228,000. Probably not two-thirds of this amount will be required, in consequence of reductions made and to be made, as already explained."

SIBERIAN TELEGRAPH LINES.—The *North China Herald* hears of the arrival from Japan of three Danish gentlemen, Capt. W. de Hede-mann, Mr. Nielsen, telegraph engineer, and Mr. Falck, inspector of telegraphs, who have made their journey overland from St. Petersburg to Vladivostok. They formed part of a mixed commission, sent out by the Russian government, in conjunction with the Great Northern Telegraph Company, to inspect thoroughly the land lines through Siberia, and they were accompanied by three high functionaries of the Russian Telegraph Department. The commission set out, on January 30th, from St. Petersburg, and arrived at Vladivostok on September 17th, having traveled about 6,700 miles. Owing to heavy inundations, the commissioners encountered great difficulties on the voyage between Kharharoika and Vladivostok, and had sometimes to travel by boats and sometimes on foot, the roads being impassable on horseback. When the labors of the commission are reported at headquarters and the proposed ameliorations can be carried out, it is expected the lines through Siberia will be put in a thoroughly efficient state and the usual interruptions in spring and autumn be avoided.

THE CAPE COD CANAL.—This canal, considered for about 200 years, as a necessity, appears to come up this year with greater force than ever, and there is a possibility that something may be done. If it was some railroad improvement in the West, we suppose New England capitalists would not hesitate one moment, and put out their money with the greatest liberality, but as it is an improvement near at home, one that would facilitate and improve the commerce of the port, they will hesitate. The voyage around Cape Cod has been the terror of our mercantile marine, and more property has been destroyed year after year than would build ten such canals as is proposed. It will not only lessen the risks but shorten the passage to Southern ports, Cuba, South America, and if the canal is completed it would be used by the New York steamers to and from Europe. The necessity of this canal will be seen from the fact, that the custom house records made some years ago, when this project was favorably considered and a charter granted, say from 1843 to 1869, 27 years, there were 1,444 wrecks on Cape Cod.

A SNOW-SLIDE in Big Cottonwood, Utah, carried away the tramway and one house of the Reed and Benson mine. No person was injured.

New Views of the Spheroidal State.

Prof. Barratt gave on the 3d of January, at the London Institution, a lecture on "New Views of the Spheroidal State." He first reminded the audience, as reported by *Iron*, what the condition was which is expressed by the words "spheroidal state." When we allow water to fall on a warm surface, such as the hob of a grate, it rapidly evaporates without noise. If the surface be nearly red hot, the water instantly and noisily hisses into steam. Reasoning onwards from these facts, we should conclude that if the surface be intensely hot—at a white heat, for example, the water would flash into vapor, and disappear the moment it touched the iron. But this is not so; and it is often here we are met with one of those anomalies that so often arrest us, and show the need of putting *a priori* conclusions to the test of actual experiment. The anomaly in this case is this: Water, or any other liquid, falling on a red hot surface, does not flash into steam, but rolls about on the glowing surface in liquid drops comparatively cool. They are not perfectly spherical, owing to gravity, but this is their anomalous deportment which has been termed the spheroidal state of liquids. So far back as 1746, Eller studied the phenomena, and Leidenfrost, a German philosopher, in 1797, published an elaborate dissertation on the subject. He, and after him Klapproth, proved that the drops were below the boiling point of the liquid used, and their explanation of the phenomena is that which has been generally accepted to the present time. Their explanation was this: By its first contact with the hot surface, part of the liquid is suddenly turned into vapor. This vapor has a definite and considerable tension or pressure. The pressure thus generated acts in opposition to gravity, for it tends to push back the atmosphere above, and with it the liquid drop. It would soon be equalized, and the drop would no longer be sustained, were it not that the proximity of the hot surface constantly generates more vapor and thus renews the upward pressure. Hence the drop is buoyed up by a shield of its own vapor on which it rests as a mobile elastic spring. The contractile force which exists on the surface of all liquids tends to draw the particles of the liquid into the smallest compass, and by what is known as the superficial tension of the liquid, the drop freed from the adhesion of the solid gathers into a little spheroidal drop. This has been the state of our knowledge up to the present time. Among the experiments which were used in illustration of this part of the lecture, it was shown very successfully by an enlarged image on the screen that a space really did exist between the drop and the heated metal on which it rested. Many allusions to the fiery ordeal and to more modern handling of heated metals were made, which are explicable in consequence of the knowledge that with a fluid on the skin highly heated metal cannot touch it. M. Boutigny, some 20 years ago, showed that even nitric acid on a copper dish, when thrown by heat into a spheroidal state, would not touch the copper. But there are cases in which the old explanation cannot hold good. For example, in some states of the weather, the water splashed up in rowing will be noticed falling back and rolling in spheroidal drops. So, too, spirits of wine and petroleum may be agitated by vibrations from a how drawn across a glass that contains them till they throw up globules which roll about on the surface. It is here, Prof. Barratt said, that Mr. Johnstone Stoney's investigations on the forces which produce the motion in the little vases of Mr. Crookes' radiometer come into consideration. To Mr. Stoney, he said, is unquestionably due the great honor of having been the first fully to explain the true theory of the radiometer. It was in the course of these investigations that Mr. Stoney had quite recently been led to show that the force which is so active in the high rarefaction (that is necessary for the effective rotation of the radiometer) is also present at ordinary atmospheric tensions. Now, it is this force which forms the new explanation of the entire phenomenon of the spheroidal state. Prof. Barratt proposed to call it "Stoney's force." In order to understand the action that occurs it must be recollected that, according to calculations, the number of molecules of air that at ordinary pressure occupies the space of a pin's head is 1,000,000,000,000,000,000; when the radiometer globe is exhausted of these molecules of air, as far as we can do it by mechanical means, there are still some few millions remaining, and these are in constant motion. Heat makes them move more rapidly, cold more slowly. If we have two surfaces very near each other, one surface hot and the other cold, from the hot surface the molecules will be thrown off with greater rapidity than they reached it; and if the cold surface be near enough, they will "homhard" it. Hence there will be a tendency in the hot and cold surfaces to retreat from one another, and when with one of these, as in the radiometer, this is possible, it ensues.

TELEPHONES will soon be within the reach of all. At no distant day every family will have one of its own. True, you can't get a good one in this country now for much less than \$50, but they are selling in London at \$8 apiece, with a downward tendency in the price.

THE SUTRO tunnel is gradually nearing the Comstock, and the blasts in the header can now be distinctly heard by the miners at work on the 2,000-foot level of the Savage and Hale & Norcross shafts.

Eastern Mining Camps.

Frank Wheeler and Hank Blanchard returned from a trip of 14 days duration among the mining towns and camps of the eastern part of the State. They traveled in a two-horse carriage, and had a good time wherever they went. They found the roads good in all directions, and their team and carriage came back as good as when they set out, though while away they traveled a distance of about 500 miles.

Aurora

The first camp visited, is highly spoken of. The town has taken a new lease of life, and improvements are going on in all directions. Many mines formerly abandoned are now being vigorously prospected, and great activity will be seen in all that region next spring. The new shaft of the Real del Monte mine, under the superintendence of George Daly, formerly of this city, is now down 85 feet. It is not expected that the shaft will cut the lode until it has been sunk to a depth of over 1,000 feet, as it is being sunk some 600 feet from the vein.

Bodie

Is a wide-awake place, and much mining and prospecting is being done. All there, are in fine spirits, and the town is rising like the Phoenix from the dust and abomination of its former desolation. Our travelers are unanimously of the opinion that it will be one of the biggest and liveliest of the new camps next spring.

Mason's Valley

Is highly spoken of as an agricultural district. The ranchmen had fine crops last year, and this year expect no less. They have an excellent market at home for all they raise, selling everything at prices much higher than those that rule here. All is in a flourishing condition at the Walker Lake Indian Reservation, and the Indians are happy and content under the rule of their agent, Mr. Holland.

At Lodi

Uncle Billy Raymond, the discoverer of the Raymond & Ely mine, Pioche, has the big mine of the country. He purchased his mine for \$60,000, and out of 700 tons of ore shipped to Sacramento cleared enough to pay for the whole mine. He now has out from 1,200 to 1,500 tons of first-class ore that will pay \$200 per ton, and about 1,000 tons that will pay \$100. He has his own furnace. This is the invention of a Mr. Gerrish, a copper smelter, and is a grand success. They refine their lullion at the mine, as they want the lead to use in their furnace, there not being a sufficient amount in the ore to smelt well.

The West Gate Mine.

At West Gate Station, is being vigorously prospected, and promises to become a first-class smelting mine. The shaft is down 100 feet, at which point they have cut across the lead, and find it to be 46 feet in width, with the mineral much more concentrated than on the surface, where it was about 70 feet in width. By next spring they expect to be taking out ore for smelting.

Both gentlemen are well pleased with what they saw in all the places visited, and come back with a high opinion of the future of the eastern part of the State. — *Virginia Enterprise*.

THE BACKWARD HABIT OF THE JAPANESE.

The Japanese habit of reversing everything, if we may regard our own way of doing as the proper way, is very curious, and in some of its details, very interesting. Mr. Griffiths, in his work on Japan, discusses it thus: "Another man is planing. He pulls the plane towards him. I notice a blacksmith at work. He pulls the bellows with his feet, while he is holding and hammering with both hands. He has several irons in the fire, and keeps his dinner-pot boiling with the waste flame. His whole family like the generations before him, seem to get their living in the hardware line. The cooper holds his tubs with his toes. All of them sit down while they work. Perhaps that is an important difference between a European and an Asiatic. One sits down to his work, the other stands up to it. Why is it that we do things contrarywise to the Japanese? Are we upside down, or they? The Japanese say that we are reversed. They call our penmanship 'crab-writing,' because, say they, 'it goes backward.' The lines in our books cross the page like a crawfish, instead of going downward properly. In a Japanese stable we find the horse's flank where we look for his head. Japanese screws screw the other way. Their locks thrust to the left, ours to the right. The baby toys of the Aryan race squeak when they squeezed; the Turnonian gimcracks emit noise when pulled apart. A Caucasian, to injure his enemy, kills him; a Japanese kills himself to spite his foe. Which race is left-handed? Which has the negative? Which the positive of truth? What is truth? What is down? What is up?"

THE Titusville, Penn., *Herald*, says: "A wealthy operator located eight dry wells last year. He is an 'oil smeller,' and oostly experience will probably never rid his mind of the delusion that a hermetically-sealed bottle held by a string near the ground will indicate the existence of petroleum 1,000 or 1,500 feet below the surface. It is a species of mumbo-jumbo business that found favor in the early days of the oil excitement, and a few respectable and intelligent natives were fascinated by the craze and have never recovered from the affliction. The gentleman spoken of has more than \$100,000 worth of dry holes to remind him of his foolishness."

Source of Water in the Mines.

A notable feature of the great porphyry bed in which rests the Comstock system of quartz lodes is its vast longitude from north to south. This remarkable zone of metamorphic rock has been clearly traced from Pyramid district on the north, to a point east of Empire city on the south, and in fact, there are vestiges of it south-east of Genoa. The general trend or strike of the mineral-bearing quartz lodes through the great porphyry belt is nearly north and south, but there are numberless curves and deflections in the system which give to each mining locality a sort of isolated quartz crescent, such as appears in the mother lode at Gold Hill and Virginia. These bendings and distortions were doubtless occasioned by lateral volcanic disturbances, long after the deep fissures were formed and filled with quartz and minerals. In addition to the manifest disturbances outside of the porphyry zone, the lodes were, probably in the miocene period, bent, crushed and distorted by eruptive dykes of trachyte and andesite, which came up in various portions of the metamorphic bed. One of these eruptive dykes followed the sloping base of Mount Davidson and Butler, and came out on the western flank of the porphyry mass, while another, of greater magnitude, was extruded further toward the east. These eruptive dykes are now plainly traceable, and afford a ready clue not only to local disturbances and faults in the quartz veins, but they also account for the remarkable crushed condition of the once solid ore chambers. Every Comstock miner is aware that most of the quartz veins here are literally crushed to atoms before extraction, and instead of the quartz retaining its original compact, flinty texture, it is little else than a mass of friable pick-rock. To this peculiar crushed condition of the Comstock quartz veins may be attributed the vast inflow of water which has so long baffled the skill and energy of mine-owners. For many ages water from the surface has been constantly percolating through the fractured rocks, penetrating and saturating the crushed material of the ledges, until the entire fissure, for many leagues in longitude, became a vast reservoir of water. As the great porphyry bed in this locality is firmly walled on the east by an unbroken wall of trachyte, and on the west by the solid base of Mount Davidson and Mount Butler, it is not reasonable to suppose that a supply of water could reach the Comstock from either Washoe valley, the Steamboat springs or the Carson river. The supply evidently comes from the lode itself, and this fact encourages us to believe that constant pumping will ultimately exhaust the aqueous annoyance. It may be urged against the theory here advanced, that there was a depth of more than a thousand feet in the Comstock where the lode was almost entirely devoid of water. In answer to this, we have only to refer to the vast longitudinal extent of the great zone. Even if surface percolation did not occur in this immediate section of the system, water may have entered the fissure at other points many miles away, and in the lapse of centuries gradually saturated and filled the entire mass of crushed and distorted minerals in the great fissure.—*Virginia Enterprise*.

Dull Times and their Cause.

During the week the two prominent mining companies will pay off their workmen, and settle charcoal and other supply bills. The aggregate amount to be put in circulation will reach \$250,000. This sum has been regularly expended for the last six months, and one would naturally suppose that coin ought to be tolerably plentiful on the Base Range. Such is not the case, however, and we doubt if there was a greater stringency in the money market during the period when the principal mines were closed down. If the dullness only pervaded the saloons, we should ascribe the cause to a change in the habits of the workmen, and the advent of a different and eteader element; but this solution of the problem is not the correct one, from the fact that merchants and business men complain as bitterly as the saloon keepers. The true reason must be sought elsewhere, and can be easily found in the all prevailing mania for stock gambling. Without preaching any worn-out homilies on the subject, we can safely assert that it is the one serious drawback to our prosperity, and that the indulgence in the passion drains every surplus dollar out of the town. Unfortunately the speculation is not confined, nor, in fact, does it affect our own mines, the Comstock and outside gambles getting away with the specie. As proof of this we could mention instances by the score—the Day mine, for example: When shares in that property dropped to \$3.50, a sure point was whispered about; there was going to be a deal; \$10 was the figure named, and 3,000 shares were taken in at the selling price. The buyers were taken in also. It dealt down below a dollar, and the insiders must be huffing yet; at any rate, the deal has not yet arrived. Tuscarora's stocks were another favorite investment, and Eureka contributed her share to the wild cats of that region, while the capacious maw of the Comstock surfeited itself on our bullion product. We are not whining over the situation, but only pointing out cause and effect. If that mythical rise ever does come, and the stock market experiences one of its old time upheavals, there will be more rich men to the acre on the Base Range than any other section of this glorious republic. In the meantime, one need not go further than the above explanation to find the true cause of the prevailing hard times.—*Eureka Sentinel*.

USEFUL INFORMATION.

Iron as a Tanning Agent.

According to the *Baltimore News*, Prof. Dr. Kapp, of Brunswick, has succeeded in inventing a process for the tanning of hides which has produced a complete revolution in tanning, and will, perhaps, be of considerable importance in a politico-economical point of view. The new process does away entirely with the application of tan and consists simply in tanning by minerals which substitute a substance far less costly than tan, growing daily more rare, and saves considerable time and labor. Moreover, the process has been practically carried on for some time and sufficient, too, to establish its practical value, which, according to the present condition of things, is beyond all doubt.

Dr. Kapp's invention consists of three parts—first, the process of producing the material applied by this new mode of tanning; second, the process itself, and third, an apparatus for that purpose. To cure the leather, Dr. Kapp employs basic sulphate oxide of iron, prepared in a peculiar manner, totally different both in appearance and its other qualities from the salt of iron known by a similar name in commerce. To produce that salt he adds the necessary quantity of nitric acid to a boiling solution of the vitriol of iron. The development of gas having stopped and the oxide of iron being formed, more vitriol liquid, which, when evaporated, yields dry salt of the oxide of iron, a clear, deep, orange-colored varnish.

To cure the hides they are hung in the duly concentrated solution of the salt of iron, now cold, and they are now sufficiently cured, according to the thickness of the hide, in from two to four days, without being obliged to move, transfer or subject to any other of the mean processes.

With the preparation now ensuing it is not necessary to grease the hides nor hang them in a dry room, or tramp them in a vat or scrape off the grease by hand or work in the grain by hand. Of all the operations formerly in use none are retained in this process but to shave and perch them. The manual labor is replaced by making a solution of the greasing material in which the hides are steeped, while they are being dried and tramped at the same time.

The fats used to grease the leather are dissolved in the usual manner, and the hides are steeped into it. Beside the ordinary grease, you may apply stearine and paraffine, never before applied for that purpose. The dissolved grease combines with the solution of iron on the fibers of the hide to a soap of iron to be rubbed into the leather by a peculiarly constructed drum. This drum consists of one of those tramping vats, revolving round hollow plugs, which by means of these same plugs is fastened to a ventilator. Turning that drum the ventilator is set in motion at the same time, which during the tramping is made to ventilate the hides, being tramped and dried at the same time. Evidently the process is very simple, requires but little time, and much cheaper than the modes now in vogue. As said before, Kapp's process has fully stood the test, and will, ere long, entirely displace the old mode of tanning.

Dr. Fol, Director of the Experimental Institute for Leather Industry, in the "Industrial Papere," speaks very favorably of Kapp's process of curing leather by iron, for the first time represented at the Berlin Leather Exposition. The tanning with iron works substantially like that with alum, equal to tan materials, penetrate the hide, holding the fibers apart so they do not re-adhere. Alum, however, is dissolved in water and is washed out by it. Tanned leather is softened by rain, just like a hide, and stiffens when dry. Iron is washed out in the same way. Prof. Kapp has removed that difficulty, applying a soap of iron to the leather, by means of which the salts of iron are made insoluble and stay in the leather. Dr. Fol had boots made of that kind of leather, now worn by him, which are still pliable in spite of long usage. At the exposition named some shoes were made of iron-cured leather by the machines there exhibited.

AN ADULTERATION OF ESSENCE CLOVES.—E. JACQUEMIN—Attention is called to the use of phenol for this purpose, and for its detection a small drop of aniline mixed with 5 or 6 c. c. of distilled water is recommended; this is added to the essence, then several drops of hypochlorite of soda. If phenol is absent, the color furnished by aniline alone is obtained a slight violet-purple, which is transitory; if present, a beautiful blue color is produced, which lasts for several minutes; one per cent may be detected.

AROMA OF BUTTER.—A Silesian farmer suspends in his empty churn a calico bag, filled with fragrant herbs, keeping the churn carefully closed. At churning time he substitutes four smaller bags, attaching one to each of the heaters of the churn. He thus communicates to the butter an aroma as delicate as if the cows had pastured in meadows most highly favored by nature.

PASTE BLACKING.—Paste blacking is made by mixing powdered bone-black with half its weight of molasses, and one-eighth its weight of olive oil, and to this is afterwards added one-eighth of its weight of hydrochloric acid, and one-fourth of its weight of strong sulphuric acid; the whole is to be then mixed up with water into a yielding paste.

A CHEAP TELEPHONE.—Prof. Barrett, in a recent lecture on the telephone, gave a receipt for making a cheap one. Take a wooden tooth-powder box and make a hole about the size of a half-crown in the lid and the bottom. Take a disc of tinned iron, such as can be had from a preserved meat tin, and place it on the outside of the bottom of the box, and fix the cover on the other side of it. Then take a small bar-magnet, place on one end a small cotton or silk reel, and round the reel wind some iron wire, leaving the ends loose. Fix one end of the magnet near, as near as possible without touching, to the disc, and then one part of the telephone is complete. A similar arrangement is needed for the other end. The two are connected by the wire, and with this Prof. Barrett says he has been able to converse at a distance of about 100 yards.

A SELF-WINDING CLOCK.—A German has invented a clock in which the winding machinery is operated by the alternate expansion and contraction of glycerine or other suitable liquid. A piston, on the surface of the glycerine, is so connected with ratchet wheels and toothed racks, that motion in either direction will wind up the weight. The inventor thinks that the contrivance will be especially valuable for self-registering meteorological instruments.

PRINTING PICTURES FROM PRINTS.—The page or picture is first soaked in a solution of potash and then in one of tartaric acid. This produces a perfect diffusion of crystals of bitartrate of potash through the texture of the imprinted part of the paper. As this salt resists oil, the ink roller may now be passed over the surface, without transferring any ink except to the printed part.

BLACKED BRASS.—French optical instruments often have all their brass surfaces of a fine dead black color. The following is said to be the process used: Make a strong solution of nitrate of silver in one dish, and of nitrate of copper in another. Mix the two together and plunge the brass into it. Remove and heat the brass evenly until the required degree of dead blackness is obtained.

PRESERVATION OF LIME JUICE.—Lime or lemon juice may be preserved as follows: Heat the juice, to coagulate all albuminous matters, and then sweeten with pure glycerine. The glycerine will not only retard turgid growth, but prevent the juice from freezing even during the coldest winters.

SIMPLE TEST FOR PURITY OF CHLOROFORM.—The *Philadelphia Medical Times*, states that Dr. Leuke, of Strassburg, gives the following simple method of testing the purity of chloroform: "Immerse a small piece of thin white blotting-paper into the chloroform, and then let it dry in the air."

GOOD HEALTH.

Advances in Medical Science.

In reviewing the medical and surgical progress for the year 1877, the *London Lancet* notes the following: M. Paul Bert has published an extensive work on the effect of variations of pressure on the body, and he shows that the observed effects of diminished pressure are exclusively due to a diminution in the tension of the oxygen in the air, and consequent predisposition to asphyxia; while, on the contrary, increase of pressure up to three atmospheres occasions more active intraorganic changes, and when the pressure reaches five atmospheres the oxidizing processes either cease or become modified in such a way as to become inconsistent with the maintenance of life. Guttman, Frickler and Oertmann have demonstrated that the absorption of oxygen is independent of the mechanical act of respiration. Richet has determined that when perfectly fresh the gastric juice contains only minimal acids, but that after standing some time a kind of fermentation is set up in which free organic acid is formed that on analysis proved to be lactic acid. It is believed to be beyond doubt that lactic as well as butyric and acetic acids are often introduced either into the stomach or are formed in it as a product of fermentation.

The most important progress in the department of pathology is that toward the establishment and diffusion of the opinion that minute organisms are concerned in the progress of acute infectious diseases. Chateau has shown that the horse is peculiarly receptive of the vaccine virus, and is capable of reproducing it in remarkable purity and force.

CO-OPERATIVE SANITATION.—It is proposed by some of the most distinguished citizens of Edinburgh to apply the co-operative principle to scientific sanitary inspection. They are attempting to organize an association, the annual subscription of which will be one guinea, for the purpose of securing to its members, free of charge, that skilled sanitary supervision and advice which could only be got at enormous cost through individual action. The association is to secure the exclusive services of one or more well-educated young engineers, who, acting under the control of a consulting engineer of high standing, will, when required, inspect and report upon the dwellings of members, giving estimates as to the cost of any alterations that may be deemed advisable. Their recommenda-

tions must be limited to strictly indispensable points, and no officer of the association is to hold any pecuniary interest in any patent or manufacture. The Professor of Engineering in the University of Edinburgh has taken such a warm interest in this novel scheme that he has offered for the first year to give the association his gratuitous services. Another feature of the scheme is that each member, on payment of a trifling fee, may secure the services of the officials for any charitable society whose work in individual cases might be aided by them, or for any person in whom they are interested, who, though deserving, is too poor to obtain for himself good sanitary advice.

VALUABLE MOUTH WASHES.—The English periodical, *Dental Science*, commends the following recipes: A wash to harden the gums.—Take one-half pint Jamaica spirits, one-half teaspoonful each of powdered alum and saltpetre, pulverized, and one ounce of pulverized myrrh; mix. A favorite wash.—Take salts of tartar, one-half ounce; honey, four ounces; alcohol, two ounces; water, 10 ounces; oil of wintergreen and oil of roses, sufficient to flavor. For unhealthy gums.—Unhealthy gums are very common. A lotion made from the following recipes will be found valuable in restoring them to a healthy condition: Carbolic acid, 20 drops; spirits of wine, two drachms; distilled water, six ounces. Use first a soft toothbrush with water, after which pour on a second toothbrush, slightly dampened, a little of the above lotion. After using this for a short time the gums become less tender and the impurity of the breath, which is commonly caused by bad teeth, will be removed. A fine tooth paste.—The following is also from *Dental Science*: Take red coral, three ounces; cuttle-fish bone, one ounce; disulphide of quinine, one-half drachm; mix. Triturate to a very fine powder, add honey "white," four ounces, and a few drops of otto of roses, or neroli, dissolved in rectified spirits, three fluid drachms, and beat the whole to a paste. A little powdered myrrh, one to three drachms, is sometimes added.

RHEUMATISM.—This disease is a standing "conundrum" to medical men, but, says the *Journal of Chemistry*, Dr. Julius Polock thinks that he has at last cleared the subject of some confusion that surrounded it. He says that the term rheumatism is applied to several different diseases which are essentially distinct, although they have certain features in common. The two chief forms are articular and muscular rheumatism. The former is a disease of early adult life, more or less acute in character, with a tendency to get well in about six weeks. Articular rheumatism, when at all severe, is called rheumatic fever. It attacks the synovial membranes and also the similar serous membranes, especially of the heart. There is a distinct predisposition to this disease in certain persons, which is sometimes inherited. The immediate exciting cause is exposure to cold or "taking a chill." It never attacks the muscles. Muscular rheumatism is a disease of middle and advanced life, is commonly chronic, and will continue indefinitely if not treated. It attacks, not the muscles themselves, but the tendons and other parts of the muscle which have a similar anatomical structure. Muscular rheumatism does not attack the heart, and is rarely fatal.

PHILOSOPHY OF LIGHT DIGESTION.—In a dietetic point of view, it would be well for weak stomachs to remember that wild birds are more nutritious than their domesticated cousins, and more digestible. But the white breast or wing of a chicken is less heating than the flesh of winged game. Other game, such as venison, which is dark colored, and contains a large portion of fibrin, produces highly stimulating chyle, and consequently the digestion is an easy and rapid affair for the stomach. But, though the whiter meats may be detained longer in the stomach, furnish less stimulating chyle, and he suffered to run into acetous fermentation, their lesser stimulating quality may recommend them when the general system is not in want of a spur. Meats are wholesome, or otherwise, less with reference to themselves than to the consumer: "To assert a thing to be wholesome," says Van Swieten, "without a knowledge of the condition of the person for whom it is intended, is like a sailor pronouncing the wind to be fair, without knowing to what port the vessel is bound."—*Dr. Doran*.

WATER FOR THE EYES.—A writer in *Fraser's Magazine* thinks that, whatever hesitation there may be justly called for in recommending one or another of the various lotions now so popular, there need be no such doubt in respect to cold water or pure water. He says in cases of much inflammation or difficulty of opening the eyelids in the morning, experienced by so many, the water should be warm, and it may be mixed with warm milk, but in nearly all other cases it should be cold. All those who have been engaged in reading or writing during several hours at a stretch, and especially at night, should carefully bathe the eyes with cold water before going to bed and the first thing in the morning's ablutions. All artisans, too, who work at a blazing fire, ought often to wash their eyes with pure cold water, and so should all those who work in wool, particularly carders and spinners, and those likewise who are employed in woolen and cotton manufactures, the fine dust which such works disperse often producing catarrhs, obetinate inflammations, swelled eyelids, etc.

The Week.

The principal topics of the week have been the passage of the Silver bill by the United States Senate, and the downpour of rain and consequent floods in some parts of the State. Concerning the Silver bill, we give a portion of Senator Jones' speech, which is worthy the perusal of all our readers, giving as it does so complimentary a record of the miners of this coast, written by a man who was once one of them himself. Although now a rich man and U. S. Senator, Mr. Jones has worked with pick and shovel in the mines, and knows whereof he speaks.

As we write, on Thursday, the skies are clear and the winds have ceased for a time. The cold weather and the cessation of rains will probably cause the floods to subside.

A FIRE in New York on Sunday, destroyed two churches and from \$500,000 to \$1,000,000 of property. The Excelsior block, costing \$400,000, was destroyed.

Product of Leading Mines in 1877.

In our annual mining review, published in January, we gave a brief history of this mining interests of the coast for 1877, and also the tables showing the bullion production. We are now able to lay before our readers a summary showing the bullion production of the leading mines during the year 1877, the information in most cases having been obtained from official sources.

In the department of hydraulic mining, comparatively little is done on this coast outside of California. As the production of these mines is largely dependent on the water supply, it suffered serious curtailment last year in consequence of the prevailing drouth. With the prospect of abundant water and other favorable conditions, the yield from this source will probably be increased the present year to the extent of 25% or 30% at least, and it is not likely that it will again fall as low as it was last season for many years to come. At present the outlook for this branch of mining is very encouraging.

As the most of the water readily available for hydraulic mining has been appropriated, more attention is being paid every year to drift operations, the field for which is almost without limit in this State, many tunnels designed for opening up this class of deposits having been started within the past year or two. As yet the most extensive drift claims are those mentioned below, but it will not be long before the list of important mines of this class is greatly extended.

Quartz mining in California is also believed to be on the eve of a marked expansion, and there is not the least doubt but Arizona will turn out twice as much bullion this year as she did last. There are many mines in this Territory capable of yielding considerable bullion, if they were only furnished with reduction works, a want that will to some extent be supplied the current year. There is good reason for believing that Nevada and Utah will also make more bullion this year than last. We have no means of obtaining the yield of individual mines in Montana, Oregon, Idaho, or, in fact, anywhere, unless their offices are in this city. There are many close corporations, which, for reasons of their own, refuse to make public any figures of their yield. The list we have prepared makes no pretense of being at all complete, but comprises the principal mines of the locations mentioned. The figures, in most cases, have been obtained from the officers of these companies in this city:

California Hydraulic Mines.

North Bloomfield, Nevada county.....	\$ 291,125.40
French Corral, Nevada county.....	223,003.30

Alps (Since Sept. 1), White Pine county.....	88,800.00
Leopard, Elko county.....	246,200.00
Grand Prize, Elko county.....	335,500.00
Mines of Lincoln county.....	600,000.00

Utah.

Leeds, Washington county.....	\$327,700.00
Ontario, Summit county.....	1,758,800.00

Arizona.

Silver King (Since May).....	210,000.00
McCrankin.....	200,300.00
Hackberry.....	150,000.00

As before stated, this list is by no means complete, although it comprises all those mines with offices in this city, where the information desired was given. There are numbers of others which have made a small product, which we have not mentioned. In the case of some of the gravel mines, we have, from partial returns, estimated the balance of the mines in the vicinity.

The Silver Bill.

Senator Jones' Great Speech on the Subject.

The Silver bill, which we give in full in another column, has passed the Senate and, in all probability, will pass the House. The feature of this debate on the question was the speech of Senator Jones, of Nevada, who went into the subject most exhaustively. In this speech, which has been very much commended even by the opponents of the bill, Senator Jones paid a glowing tribute to the mines, to whom the country is indebted for the financial structure on which it rests. We condense the following from Senator Jones' remarks:

It has been persistently urged that if silver has not yet depreciated, its tendencies are in that direction, and that if we remonetize it, we shall be overwhelmed by the discarded refuse stock of other nations, and that this country will be cursed with fluctuating, depreciated, unreliable and worthless money. Look to whatever quarter we may for the source of this threatened flood, it cannot be found. France has none to spare. The \$300,000,000 of silver she has is all urgently needed as a basis for her paper issues. She can only discard it by supplying its place with gold. If she enters upon this experiment now or in the near future, it would postpone indefinitely any attempt at gold redemption in this country. Our legislation must therefore be based on the idea that France must continue her present money system indefinitely. Reliable information from Germany shows that the disposable stock in that country does not now exceed \$70,000,000. This amount might be emptied into three or four of the Western States without producing a flutter in the financial atmosphere. England, has not now and never keeps any considerable stock of silver on hand, but is constantly obliged, in order to meet the demands of her commerce with India, to telegraph orders for silver on San Francisco. There are no Disposable Stocks Elsewhere, Either in Europe or America, and silver never returns from the Eastern world. Whenever the prediction has been made that the markets were to be flooded with any other articles than silver—such as cotton or wheat—it has generally been deemed necessary, if the object was to affect the prices of production or the use of those articles, to point out specifically from what quarter of the globe the floods might be expected. But in respect to silver there has been a beating of gongs and a universal shout of warning to the people to maintain legislative dikes against the incoming floods of that metal whose source they have been unable, or unwilling to point out. This Chinese system of warfare against silver has proved ineffectual, because, upon examination, the masses of the people could not see that any evil would result to this country, even if the entire stock of German and French silver should be sent here. On the contrary

The People Believe

That a silver flood of only that magnitude could result in no injury whatever, but would only serve to revive the stagnant industry and commerce of the country. The Comstock lode, confessedly one of the greatest mineral-bearing veins ever discovered, and in the hands of the most vigorous, pushing, energetic, ingenious and enterprising people, has yielded less than \$200,000,000 of silver since its discovery 20 years ago. During that time exhaustive explorations have been made along its entire length to a depth of 2,000 feet. In view of facts like these, something more immediately threatening to the value of silver, and more plausible than a deluge of that metal from the distant mountains of Peru, was needed to frighten the people from restoring their ancient money standard.

The Rise of Gold.

I have so far considered the rise in the value of gold since 1872, as demonstrated and measured by the average fall in the price of commodities; but the rise in its value, as shown by the fall in prices of land and labor, has been vastly greater, and has contributed much more powerfully to the business prostration everywhere prevailing. Land and labor immeasurably overshadow in magnitude and importance the aggregate of mere merchandise that was ever in existence at any given period. Land in all civilized countries is the great basis and bulwark of credit, and a general or considerable fall in its price has never failed to be ruinous to every commercial and industrial interest. The inevitable consequences of a rise in the value of money, or, in other words, of generally falling prices, are

Stagnation of Industry.
